The Nation.

NEW YORK, THURSDAY, JANUARY 2, 1879.

The Week.

THE Investigating Committee of the Senate, under Mr. Blaine's resolution, were taken aback early in the week by the opinion of Mr. Porter, the Comptroller of the Treasury, that they could not use the appropriation made by the Act of June 8, providing money for the expenses of enquiry "into alleged frauds in the late Presidential election." This bill originated in the House, and was intended to supply money for the Potter Committee; but the Senate amended it by providing that a similar sum should be placed at the disposal of the Senate for the expenses of "said investigations and enquiries as have already or may hereafter be directed by the Senate during the period of the Forty-fifth Congress." As the phraseology stands, it seems as if the Senate Committee could have no money except for enquiries into Presidential election frauds, and so the Comptroller at first decided; but he has since reconsidered his decision and submitted himself to that of the Attorney-General, who has declared that the word "said" is evidently a mistake for "such," and that, therefore, the money is applicable to any enquiry the Senate may please to direct. This is a rational view of the matter; but whether the Attorney-General can make rectifications in a statute in this way is something on which we do not venture to offer an opinion. His action, at all events, will prevent the labors of the Committee from coming to an untimely end. A detachment of them has gone to New Orleans.

The Committee have heard from Mr. Blaine in reply to their enquiry as to the line of investigation they were expected to pursue, and asking him for "information," "evidence," and "names of witnesses." He observes, a little tartly, that they must not look to him for guidance, as the investigation is the investigation of the Senate, but he does not mind telling them that they ought to examine in South Carolina the "tissue-ballot frauds," the laws of the State about polling places, "the practice" of breaking up Republican meetings unless Democratic speakers were allowed to divide the time, and "all the methods by which, in Sumter and other counties, a full and free election was prevented." In Louisiana, he "invites their attention" to "murder and frauds" in Tensas parish, to "frauds and outrages on the ballot" in New Orleans, and to the "alleged assassination, even while I write," of two witnesses on their way to testify, etc. He would say more, but that he was "just leaving for New England." He gives the names of nine witnesses, and refers the Committee to "a large mass of valuable information in the Attorney-General's office," and concludes by denying that he is in any sense a "public prosecutor." It does not appear from his letter that he has any knowledge of the Southern frauds and outrages except what he got, or might have got, from the *Times* or *Tribune* of this city. Nothing has as yet been heard from Mr. Thurman, who is expected to furnish indications with regard to "frauds and outrages" at the North.

The New York *Times*, on the day after Christmas, devoted seven and a half columns of leaded type to a biographical sketch of Franklin J. Moses, the late Governor of South Carolina, under the taking title of "A Romance of Rascality." It traces the hero's career from before the war down to our own time, in four chapters, three of which are entitled respectively, "Speaker (of the Assembly) and Thief," "Governor and Wholesale Robber," "Downfall—Beggar and Criminal." There are some inaccuracies in the narrative, which we shall not take the trouble to point out. What is remarkable in it, and in a certain sense very entertaining, is that the biographer talks through the first three chapters as if his hero had since the war lived and acted *in vacuo*, and had committed all his villanies without assistance; as if, in short, he had become "Speaker and Thief" and "Governor and Wholesale Robber" without a Legislature and the "Republican party" at his back. The first intimation we get of anybody's being responsible for him is in chapter iv., which describes the "Beggar and Criminal" stage. At the point where Moses escaped from indictment for fraud and larceny through a technicality, the historian calmly relates that "the thoughtful men among them [the negroes] began to doubt Moses, and some of the most respected white Republicans—men like Daniel H. Chamberlain—openly declared that he was a disgrace to the party which supported him." To appreciate this—which is, we think, the richest thing in the literature of carpet-baggery—we must remember that Moses was at this time in the fourth year of his crimes, and that he had been elected Governor while "Speaker and Thief." It would seem, indeed, as if the South Carolina Republicans did not suspect a man until he publicly confessed his enormities and clamored for admission to the penitentiary.

We need hardly say that the real reason why "the thoughtful black men" and "the respectable white Republicans" repudiated Moses in 1874 was that embezzlement of the taxes had become difficult or impossible, through the exhaustion of the people, and the State credit was ruined by Kimpton's bond sales, and their operations had attracted the attention and were rousing the indignation of the Northern public. Moses was the most foolish and brazen of the lot, though probably not the worst morally, so they threw him overboard and began shouting for reform. Poor Moses himself tried to play the same game, by delivering a lecture on "Infidelity," which might have helped him if it had not been discovered that he stole it bodily from Robert Hall. He is now in this city in a state of absolute destitution, and, we believe, ascribes his forlorn condition to the President's treacherous course towards "the party" at the South, and would go down to Washington and "rouse the nation" if he could procure the needful funds for a railroad ticket. A wiser, though perhaps more profitable, course would be to lecture on himself and "the party." If he has even mediocre power of statement he can in this way contribute an absolutely unique chapter to the history of Christian civilization.

The newspapers which have been giving publicity to the grievances that respectable Republicans at the South have suffered at the hands of the Democracy seem to have performed an ungrateful task. Some of the persecuted ones disclaim the crown of martyrdom which is thrust upon them, and flatly deny the accounts of terrorism which correspondents have been at such pains to collect. Among those who decline to be the objects of what they consider a misplaced sympathy is the Rev. Dr. Cooke, the president of Claflin University for colored people, of South Carolina. The *Tribune* of November 29 contained an account of intimidation at the South in which it was asserted that Dr. Cooke had been carried to the polls this year in a wagon used by the Democrats to bring in aged and infirm voters, and that he had openly voted the Democratic ticket. The writer said that this painful sight was the result of dreadful ill-treatment which Dr. Cooke had received at the hands of roughs on a railway train at the time of Governor Hampton's election in 1876, which treatment had frightened him into complete submission to Democratic wishes. Dr. Cooke writes to the *Tribune* that "not one true or fair statement is contained in the paragraph relating to himself." He denies explicity that his political action has ever been influenced by intimidation, and adds that, although a Republican himself, he claims no political fraternity with many Republicans in the South. His vote was cast on good and satisfactory grounds, especially because, after watching Governor Hampton's

course for two years, he believes that he is a "true friend of the colored man, and is doing vastly more for his elevation in this commonwealth [South Carolina] than any Northern man could under bayonet rule." Dr. Cooke adds that he "need only point to the improved common schools and the increased facilities for the negro's intellectual training in proof of this assertion."

The *Tribune* correspondent replies by a reference to the "high character" of his informants, but, apparently feeling shaken in regard to the grievances of Dr. Cooke, he puts his best talent into corroborating the story about the Democratic wagon for the aged and infirm. This incident is supported by the testimony of one Democrat and three Republicans, whose names he sends the editor privately, but does not feel at liberty to publish. And so the wretched fight is kept up.

During the week the only remaining condition that was unfavorable for the successful beginning of specie payments by the United States Treasury changed so as to be favorable; that is to say, the market for sterling bills, which, by reason of the financial disturbances in London, had advanced to near the point which draws gold from here, became weak, and rates declined to nearly three points below that at which gold would be exported. The trade exchanges between the United States and Europe continue to be much in our favor, but it was feared that the London money market might get into such a condition as would compel us to send gold there. Gold-coin exports from here, even if it were known that they could only be temporary, would have been most unfortunate, in that they would have impaired the full confidence necessary during the early weeks of specie payments. Nowhere except in the Gold Room has there been any difference between gold and legal tender and national bank-notes. The banks have exchanged one for the other on equal terms, and the foreign bankers late in the week sold their drafts on London for ordinary bank-checks; this is the first week that they have done so in about seventeen years. They will continue this practice so long as U. S. legal notes are paid with gold dollars. When they come to be paid with silver dollars then specifically gold checks will, of course, be required for drafts on London. The London Stock Exchange closed the year on buoyant markets. The same is true of the New York Stock Exchange. Silver ruled at 49½*d.* to 49⅝*d.* per oz. in London. The bullion value of the 412½-grain silver dollar here at the close of the week was $0.8391.

An important decision of the United States Supreme Court has been made in Washington which threatens to unsettle some questions that were supposed to have been decided by Congressional and State legislation. In the year 1838 the State of Tennessee organized the Bank of Tennessee, providing by a clause in its charter that all its issues of circulating notes should be received in payment of taxes. But by a constitutional amendment in 1865, when the State was undergoing reconstruction, it declared the issues of the Bank made during the war to be void, and forbade their receipt for taxes. The Supreme Court now declares this amendment to be contrary to the provision of the United States Constitution against impairing the obligation of contracts; and decides, further, that the political society which in 1796 was admitted as a State into the Union by the name of Tennessee has remained the same body politic up to this time, and all its acts, legislative and otherwise, unless contrary to the United States Constitution or done in aid of the Rebellion, are valid and binding at the present time. The decision of the Court concerning the issues of the Bank of Tennessee during the period of Rebellion is that they are not proved to have been done in aid of the war, and hence cannot be declared void. The Chief-Justice and two associate justices dissented from the Court on this point.

The House Committee authorized by the last Congress to investigate the administration of Secretary Robeson have completed a majority report. It is well known that the condition of our Navy is in no way proportionate to the immense sums of money which have been professedly spent in its maintenance, but the immediate cause of the present investigation lies in the following facts: Ex-Secretary Robeson had asked for an appropriation of $2,003,861 27 to meet certain deficiencies, and at the same time the present Secretary of the Navy states that there existed an actual indebtedness of various bureaus of the Department amounting to the sum of $3,217-738 76, and a contingent liability besides of $3,600,263 09, arising from certain agreements made by his predecessor in office, which he had found no adequate appropriation for, and hence had suspended. In prosecuting their enquiry the committee gained the following information from the officers and books of the Department concerning the manner in which ex-Secretary Robeson had executed his trust. More than $20,000,000 had been spent by him in direct and almost ceaseless violation of those sections of the Revised Statutes which provide that purchases and contracts for supplies or services should be let to the lowest bidder who is a regular manufacturer or dealer in the articles which he wishes to supply. Large amounts of public money were expended by him without their first being appropriated by Congress, and he involved the Government in large liabilities without authorization, both of which proceedings were of course directly contrary to law. It appeared by the testimony that thirty-one ships, whose original cost was $13,775,837 52, were sold for $542,524 47; and ships that cost the Government $12,614,390 45 were broken up and sold for $541,831 16, from which is to be deducted the sum of $101,874 44, cost of destruction. Materials whose cost is not ascertainable have been sold for trifling sums, and these sums have been expended without being first appropriated by law. The report contains many other instances of illegal sales and expenditure. In the work done for the Government extraordinary extravagance has been exhibited. Five double-turreted monitors, not yet completed, have cost in property for which the Government paid over $10,000,000, and in money over $1,500,000, and by present estimates it will take the sum of $2,500,000 to complete them, exclusive of machinery. Their cost will therefore be on an average over $4,000,000 each, and in considering this estimate it must be borne in mind that the ships destroyed were valued as old material. The report concludes by a recommendation that the ex-Secretary be indicted. He, however, continues to be lively and hopeful, is in favor of another term for General Grant, and has just been returned to Congress, where he will "make it hot under the old flag."

Archbishop Purcell, of Cincinnati, is furnishing the world with an illustration of the extreme imprudence of mixing up religion and business; or, in other words, of taking people's money because they like your theological opinions or respect your ecclesiastical position. It appears that he has now for several years been in the habit of acting as a savings-bank for poor people of his own church, paying them a moderate interest on their money and lending it at a higher rate for the building of Catholic churches, schools, and asylums. It is said that as much as two millions has in this way found its way into his hands and been disposed of. Of course, security of this kind is, strictly speaking, no security at all. The churches and schools and asylums cannot be sold out to satisfy the depositors, among whom a panic has broken out, and the Archbishop, being unable to meet the run on him, has been obliged to appeal publicly to the charity of the faithful—which is really what he lent the money on—to extricate him from his difficulties. It is extraordinary that a prelate of his standing should expose himself to such embarrassment and humiliation, and that he should not have foreseen its possibility. The Catholic Church in this country has thus far kept itself singularly free from money scandals, but if it means to keep up its reputation it will have to avoid the savings-bank business, and avoid also the raising of large sums by games of chance, to which it resorted so coarsely recently in the Cathedral in this city.

The previsions of those who opposed Mr. F. L. Olmsted's removal from the supervision of the work on the Central Park appear to be fully justified by what has since occurred. The construction of the Riverside Park—a beautiful drive that is to be, overlooking the Hudson River—is still in progress, ostensibly on Mr. Olmsted's plans. The contractor soon after Mr. Olmsted's removal rose up and declared that the superintending engineer, Mr. Aldrich, whom Mr. Olmsted had left there, was requiring him to do work not specified in the contract. Thereupon the majority of the Commissioners promptly removed the engineer, and appointed in his place a Mr. Franklin without requiring testimonials as to his professional competency, Mr. Lane, one of the Commissioners, alone opposing it. This gentleman has since succeeded in obtaining a report to the Board from three competent outside engineers on the work already done. They declare that the contractor has "materially failed" in some "details and requirements," with the connivance of the superintending engineer, and that

"the boundary of the avenue, the dimensions, location, and arrangement of walks, grass-surfaces, etc., have been altered from the original design as submitted to and approved of by your department; that alterations in the dimensions or material and character of work have been made and permitted by the present superintending engineer, wholly arbitrary on his part, being not only without the sanction of, but even the knowledge of, your department."

They further state that the supervision exercised has been "in disregard of the original design," and "in nowise calculated to meet the just expectations of those who are to bear a moiety of the cost, and of the public at large." And yet the report has evidently been written with great reserve.

There has been a most painful "conflict of veracity" between a reporter of the New York *World* and the Duke of Edinburgh, whom the former interviewed on board his ship some time ago, and professed to have obtained his views upon Lord Beaconsfield and his policy. He made the Duke declare his "disgust" with both. The British Admiralty, however, by a timely communication to the London papers, declared the whole story to be without foundation—of course on the Duke's authority. The reporter, however, reiterates his original story, which he corroborates by a description of the mode in which he reached the ship, and his editor evidently stands by him, and cites the testimony of a rival journal, the New York *Times*, "that a *World* reporter cannot lie," which is certainly very strong and gratifying. But the same paper declares that a Royal Duke "cannot lie," thus tacitly denying the force of the principle of Excluded Middle, which we had supposed was not deniable, and leaving the public in a very awkward position. It is to be said in favor of the reporter that it is also alleged on good authority that Lord Salisbury declared some years ago that he regarded the Earl with "loathing"; and that numerous highly-placed persons in England regard him with "disgust" there is no manner of doubt.

The report of the British delegates to the International Silver Conference has appeared in England, though no copy of it has reached us, and we are indebted to the London *Economist* for a summary of its contents. It appears from it that the English Government had at first determined not to take part in the Conference at all, and were induced to do so by an appeal from the Indian Office, but only on the understanding that England would not in any way agree to alter its currency policy. Sweden, Norway, Belgium, and Switzerland also appeared pledged to the gold standard, which made it plain from the first moment that the Conference would prove a failure. The other Governments occupied an "expectant attitude," and the only ally of the United States was Italy. The *Economist* says it was "rather amusing" to find that the American delegates, who called the Conference, had no distinct proposals to make, and only moved their two vague declarations of opinion after much urging. Mr. Groesbeck, the American spokesman, did not, the report says, devote himself to advocating the propositions of the silver-men, but to explaining the attitude of the United States. He made, to the foreign commissioners, the astounding assertion that silver was demonetized by a kind of inadvertence. Of course such a statement about a civilized Government, coming from its own representative, could not be easily criticised; but we are glad to know, for the credit of the country, that the commissioners did not believe a word of it. That a man of Mr. Groesbeck's standing should carry such a story about his own country to an assembly of European financiers shows the debasing effect of "politics" even on the best minds. Silver was demonetized here after careful and prolonged discussion and consideration. Americans are not such savages as to alter their coinage without knowing it.

The news from England since the renewed triumph of the Ministry in Parliament on the motion of censure consists of little but accounts of commercial failures, and deep and increasing distress among the working classes. But that imperialism begins to pall on the voters, and that a dissolution would probably ruin the Government majority, seems daily more probable. The Conservatives have just lost two boroughs, Bristol and Malden, which they have held triumphantly since the last election, and their defeat in Bristol, which is a great city, has made a deep impression, which has been lightened, however, with Lord Beaconsfield's usual luck, by the news of the death of the Princess Alice, the most popular of the Queen's children. The expressions of sympathy and sorrow which it has called forth are a striking illustration of the hold of the reigning house on the imagination of the upper and middle classes, though Lord Beaconsfield's rhetorical announcement that it was "a great calamity" would probably hardly express their feelings. The failure of the West of England Bank, striking about 2,000 shareholders, several hundreds of them spinsters and widows, with unlimited liability for at least $1,500,000, has spread and intensified the consternation which the continued industrial depression is everywhere exciting, though the outbreak of strikes on a large scale in some of the trades shows how little the working classes as yet appreciate the gravity of the situation.

The situation in Afghanistan remains substantially unchanged. Yakub Khan's adhesion to the British is not yet confirmed, and, as we remarked last week, if it were he could only be maintained by a British guaranty. The whereabouts of his father, meanwhile, is still vaguely guessed, and his retreat is no longer taken to be the end of the campaign. Nor do we hear any more of the readiness to surrender Candahar, of which the Governor is said to have ordered a levy *en masse* for resistance, and to have met with a hearty support from the people. But the only well-informed parties just now as to what is going on beyond the British lines are the Russian mission, with whom the Amir is supposed to be travelling, and the Government at St. Petersburg.

In France everything is in a kind of suspense waiting for the Senatorial elections on the 1st of January, which are expected to transfer the majority in that body to the Left, and put an end completely to the influence of the Monarchists in the Government. In the meantime a good deal of interest has been excited by a speech of M. Waddington's explaining the position now occupied by France towards the Eastern complication. He spoke highly of the Treaty of Berlin, not as an ideal arrangement, but as the best possible one, and declared his belief in its complete execution, but denied emphatically that France had contracted any engagement about its execution that was not already known. He took to himself the credit of securing the recognition of the right and expediency of giving Greece an extension of her frontier, not only for the sake of the Greeks, but for that of the Turks. At present, however, France was pursuing her traditional policy as the patron and protector of Greece, was pushing her claims to the rectification of her frontier, and was taking care that in pushing it she (France) was not acting alone.

THE LAST TRACE OF THE WAR.

THE disposition to believe that the calendar year furnishes also a moral division of time, and that when a man is going to make changes in the conduct of his life, or "turn over a new leaf," as it is called, the first of January is the proper time to begin, is not an unnatural one, but it does not derive any great support from observed facts. The close of the year always sets people reflecting very seriously on their experience of one sort or another, and causes them to make a note of many of its lessons and suggestions, and there is a certain hopefulness in the air which predisposes them to make good promises on New-Year's day; but it is usually found in practice that reform is not easier in January than in any other month, and that, in fact, changes in one's life and manners are made without much regard to dates. They come from influences and events with which the calendar has nothing to do, and which are just as likely to spring on us in summer as in winter, and which work, for the most part, with ruthless or happy disregard of fêtes and anniversaries. Good resolutions which begin to be carried out on New-Year's day are usually the result of agencies which have been long in operation, and the selection of the day on which the outward and visible sign of them is to appear is, or may be, entirely arbitrary, or the result of merely material convenience. The reason, for instance, for choosing the first of January, 1879, for resumption of specie payments by the United States is not that it is easier to keep one's promises on this day than any other, but that, some day having to be fixed, the day when new accounts are opened in business was probably the most desirable for the purpose. But the *animus* of paying, of which resumption is the external indication, has been long forming, and was probably as strong a year ago as it is to-day.

Having been selected, however, as the day on which the last striking trace of the Civil War was to disappear, it furnishes a convenient point for recalling some of the great moral changes which have passed over the country since gold was last in circulation. There has, in the first place, been an enormous increase of confidence in the future of the nation as a nation, in its strength, its power, and its continuance. The fear which haunted the imagination of some of the founders of the Government, and which grew during the anti-slavery agitation, that the Union would some day break into a number of warring fragments, may be said to have wholly disappeared. There is no longer any appreciable doubt that the American people will remain under one government, and will continue to be one of the great powers of the world, both in war and peace, and, even without raising a finger for the acquisition of influence, will through mere mass, and visible though unwielded strength, acquire immense weight in the commonwealth of western nations. It would be difficult to overestimate the depth of the impression which the spectacle of its prodigious bulk and force as revealed by the war has produced on the mind of European political observers. The revelation has, in fact, forced nearly all foreign thinkers to readjust their whole system of political calculation, and to make a very serious revision of their forecast about the future of the Christian world. It has opened up many possibilities, both social and political, not previously thought of, and has given sharpness and definiteness to many previously vague and even extravagant anticipations. At home it has greatly diminished the habit of self-assertion and the eagerness for recognition which were marked national characteristics before the war. All the old fidgetiness has gone out of the national self-confidence, because there is now no reason to fear comparison with any other power in the things by which national greatness is roughly estimated in the international forum—the ability of the Government to call great armies and fleets into existence, to levy heavy taxes for their support, and try the endurance of the people by prolonged calls on their moral and material resources.

On the other hand, there has been since 1861 a marked and undeniable decline in the confidence of the reflective class in the particular kind of machinery by which the Government has hitherto been carried on, and in the ability of universal suffrage to provide readily for new situations and exigencies. All legislatures, both national and State, are held in less respect than they were before the war, and this decline of confidence in them is not successfully met by the method so often resorted to, of showing how foolish some of the statesmen of the olden time were. This looks effective in a magazine or newspaper article, but it really satisfies few readers. People who take politics to heart feel that even if the men have not changed, the times have; that the demands of American society on its rulers are far greater than they used to be, because it has grown in complexity as well as in size, and they are chagrined if the country cannot produce such statesmen as they think it needs. There is more doubt now than there has ever been that such men exist, but there is a great and widespread disbelief in the possibility of having them brought to the front by means of existing institutions, and grave questioning as to the possibility of going on much further prosperously without their aid. The material future, it is true, never looked brighter: it seems as if the country were only just beginning to draw on its magnificent natural resources; but in drawing on them and in increasing trade, commerce, and population we increase also the intricacy of the problems, both political and social, with which we have to deal. If the experience of the last seventeen years has taught anything clearly it has taught the necessity of the application to the work of government of a greater amount of the inventiveness, adaptability, forethought, and shrewdness which are so lavishly displayed in trade and industry. In the conduct of business enterprises of every kind Americans stand in the front rank—no other nation displays such ingenuity in its processes. In politics, however, we still transport our goods on pack-horses, cut our grain with the sickle, and thresh it with the feet of oxen, and light our fires by rubbing two sticks together, and have a kind of Turkish pride in our backwardness. The arguments by which any attempt to improve the administration of the Government is resisted recall the old defences of the stage-coach against the railroads.

With regard to this, however, good reason for hopefulness is to be found in the discredit which since the war has overtaken the whole school of transcendental politicians. There are very few men now—they abounded at the close of the war—who venture to ascertain what ought to be done in a given case by tapping their breasts, or profess to be the possessors of a hidden light on public affairs, or who insist upon embodying "broad principles" in legislation, without any regard to the experience of mankind as to their working. There were men at the close of the war who would have advocated negro suffrage even if it was sure to ruin their country; there is hardly anybody now who does not acknowledge that suffrage, like other things, has to be considered and regulated with strict regard to its effect on civilization and human happiness. Even the friends of female suffrage have grown utilitarian in their talk. There has been, too, in politics, at least, a great and most beneficial diminution of

> ". . . the restless will
> That hurries to and fro,
> Seeking for some great thing to do,
> Or secret thing to know";

and with great gain to the country. Even ten years ago multitudes of good people were possessed with the idea either that they had made or were on the point of making in politics a discovery with which they would in a year or two change the face of human society. The natural eagerness among them to be first in the field with their patent caused a prodigious commotion, and a kind of dread silence and expectation which no critic or doubter was allowed to disturb on pain of stripes and expulsion. This captivating illusion has, however, almost wholly passed away. The generation which cherished it is somewhat older, sadder, and much more patient. Both it and the one which is coming forward to take its place in the arena have turned again to the old truth that in the affairs of nations, no matter what improvements may be made in machinery, things are made to go well not by sudden flashes of inspiration, but by watchfulness, by patience and deliberation, by "toil of hearts and

knees and hands," or, in short, by making to-morrow the chief care of to-day.

THE FEDERAL JUDICIARY AND THE REPUDIATORS.

"NO city, town, village, county, or other municipal or public corporation shall be sued in the courts of the United States."

Such is, in part, the language and the *gist*, as the lawyers would say, of a bill recently introduced into the Senate of the United States by Mr. Garland, of Arkansas. The inspiration of the measure can doubtless be traced to the following resolution, adopted by the Arkansas Democrats at their latest State convention, held July 6, 1878:

"We demand by Congress such legislation as shall prevent the interposition of the Federal courts, by *mandamus* or otherwise, between the courts of the States and the counties and cities of the States. Such interference, being hostile to the theory of our government, leads to centralization, and also deprives the State of a free and rightful exercise of its sovereignty."

What is meant by the foregoing language is easily explained. When the war was over, the people of Arkansas and similarly situated districts realized the need of railroads and other public improvements to develop their country. Not having the money to supply what they wanted, they issued their promises-to-pay in that form of commercial paper known as bonds, and put them on the market to be purchased by those having money. The means thus obtained was, in part at least, applied to the purposes intended, and in part, possibly, was wasted or stolen by officials for whose delinquencies those who elected them alone ought to suffer. All this was satisfactory enough until the time came that principal or interest of the bonds was to be paid. Then it was discovered by the involved communities, as has been done by many another debtor, that a mistake had been made, and repudiation was resolved upon. At first the courts of the States followed the rules governing in cases of other commercial paper in the hands of innocent purchasers for value; but judges being elective, and for short terms of office, it did not take the people who wished to escape liability long to reverse objectionable decisions by changing the courts. In that way numerous securities, held legally valid and sold under that guarantee, were soon afterwards pronounced of no account by the very tribunals that had endorsed them. And that would have been the end of it had it not happened that the Federal courts for the districts concerned, which were presided over by men holding office for life, and thus raised above local influences besides possessing a regard for law, had jurisdiction in such cases in behalf of non-resident plaintiffs, and not only rendered judgments in their favor against the indebted communities, but proceeded by mandamus to compel their officers to levy taxes and provide the means of their payment. Then it was that the people of such communities began to perceive that the jurisdiction of the Federal courts in such matters was "hostile to the theory of our government," that it led to "centralization," and—worst of all—that it was in conflict with the convenient, but exploded, doctrine of State sovereignty.

As to the practical effect of the proposed measure, if adopted, there can be but one conclusion. It would wipe out the debts of a great majority of Western counties, cities, and towns, amounting to very many millions of money, "as with a sponge." The legal rights of bondholders would remain, but with no remedy except what might be provided by tribunals supplied and governed by their debtors—subject to the principle, as applicable in law as in physics, that the stream cannot rise above its source—and their bonds would be worth just about the same as so much Confederate paper. As to the morality of the thing there can be no uncertainty. The object is to facilitate repudiation. It is simply proposed to leave the question of payment or non-payment to the debtor, after he has announced his purpose not to pay. But behind this proposal there is a question possibly even more serious than the financial one, and which it may be well at this point to consider. That question is, Whether the Federal Judiciary shall be extinguished? A few historical facts will show how real and pertinent that enquiry is.

When the national Constitution was adopted the Government was divided into three separate departments, which were intended to be co-ordinate—namely, the legislative, the executive, and the judicial. But before many days had gone by it was discovered that, under the equitable provisions of the Constitution, States were liable to be mulcted in judgments at the suits of private citizens in the Supreme Court of the United States; and as they had incurred many liabilities during the war just over, the accountability thus likely to be enforced promised to be formidable. The people, always sensitive to anything threatening the public purse, were alarmed. The result was the submission of an amendment to the Constitution, now known as the Eleventh, providing that while individuals might still be sued by States, States should not be suable by individuals—the jurisdiction of the national judiciary being abridged to that extent; and as the persons who were liable to contribute to claims against the States were much more numerous than those holding claims, the amendment was adopted. Nothing could be more unfair in practice or reprehensible in principle. It was bald repudiation. That amendment impaired the symmetry of the Constitutional plan as first adopted, and has been a standing reproach to the nation ever since, inasmuch as it has been a continuous cover for flagrant injustice. At this day, by reason of it, there are obligations of States, issued under their broad seals, outstanding to the amount of one hundred and eighty millions of dollars that are dishonored, and no legal remedy exists to their injured holders.

It is significant that, while the first great wrong on private citizens that was perpetrated by the American people under their new government was accomplished by an abridgment of the jurisdiction of the Federal judiciary, in restricting that portion which covered the States, now, when it is proposed to cheat private citizens out of some hundreds of millions of dollars, the method suggested is the further reduction of that jurisdiction by withdrawing from it communities which stand next to the States in dignity, viz., cities, towns, villages, counties, and other municipal and public corporations. And if corporations are to be independent of the Federal courts, why should not private persons be similarly exempt? And, indeed, we find this to be the position assumed by another party to the movement in which Arkansas seems to be the leader. At their last State Convention, held July 10, 1878, the Missouri Democrats put forth a platform in which they say:

"We declare that the jurisdiction claimed and exercised by the Circuit Courts of the United States over questions of corporate and *individual* rights, arising under the laws of the State, tends to oppress and burden litigants to such an extent as to amount to a practical denial of justice in many cases, and we consider the legislation which has conferred such jurisdiction as unwise and hurtful to the true interests of the people."

Here, then, we have the avowal of a policy which would extinguish the jurisdiction of the Federal courts over both corporations and individuals, so far as the interests of the great body of the people are ever likely to be affected, and practically leave the Government with but two departments. To the credit of the Missouri Democrats it must be said that they are, at least, logically consistent. The secret of Missouri's enlarged opposition to the Federal courts grows, it is understood, out of the fact that, in addition to her indebtedness on municipal bonds, her people owe largely to non-residents on what are known as "farm mortgages." A similar condition of things probably led the Grangers of Illinois, at their last State gathering, to pronounce against the Federal courts. They, too, want the privilege of appointing the tribunals that will decide between them and their foreign creditors. And here it is well enough to observe that Congressman Townsend, of Illinois, has introduced a bill in the House quite similar to that of Senator Garland.

How important the founders of our Government regarded the general authority of the Federal courts appears in that article of the Constitution defining their jurisdiction, which declares that the judicial power of the United States shall extend to controversies, among others, "between citizens of different States." The unrea-

sonableness of permitting one party to a controversy to designate and regulate the tribunal that is to decide it, was quite sufficient justification for that article; but nowhere has the argument been more forcibly presented than by Hamilton in the *Federalist*, in paper No. 80, in which he says:

"It may be esteemed the basis of the Union that 'the citizens of each State shall be entitled to all the privileges and immunities of citizens of the several States.' Hence it follows that, in order to the inviolable maintenance of that equality of privileges and immunities to which the citizens of the Union will be entitled, the national judiciary ought to preside in all cases in which one State or its citizens are opposed to another State or its citizens. To secure the full effect of so fundamental a provision against all evasion and subterfuge, it is necessary that its construction should be committed to that tribunal which, having no local attachments, will be likely to be impartial between the different States and their citizens, and which, owing its official existence to the Union, will never be likely to feel any bias inauspicious to the principles on which it is founded. The reasonableness of the agency of the national courts in cases in which the State tribunals cannot be supposed to be impartial speaks for it. No man ought certainly to be a judge in his own cause, or in any cause in respect to which he has the least interest or bias. This principle has no inconsiderable weight in designating the Federal courts as the proper tribunals for the determination of controversies between different States and the citizens of different States."

While it is true that an ordinary corporation is not a "citizen" of a State in the sense of the Constitution, it is true, as the Supreme Court of the United States has several times declared, that a municipal corporation which is made up exclusively of citizens of a State so far partakes of their character as to come within the meaning of the Constitution. It is ridiculous to hold that a private person, because of his possible influence with the courts of his State, shall be subject to be sued by a citizen of another State in the Federal tribunals, and that a corporation, made up of ten thousand individuals, and whose influence over a local judiciary is proportionately increased, shall not be so subject. How Congress, in the interest of communities which are in favor of making, but not of paying, their bonds, can evade so plain a construction of a leading article of the fundamental law, it is not for us but for the projectors of the measure to explain.

Congress should interfere in the matter—not to release the grip of the Federal courts on municipal and other public corporations, that they may the more flagrantly trifle with their creditors, but to strengthen their hands in dealing with them. The dishonesty of such corporations in large portions of the country has become a national scandal. Hundreds of them are now refusing to pay their debts—some with a view to forcing their creditors to accept a part of what belongs to them in compromise, and some in the expectation of defeating all payment. In these endeavors they are, in too many instances, notoriously favored by local legislatures and courts. Even with the jurisdiction of the Federal tribunals extending over them, no debtors have proved so refractory and so difficult to bring to the law's requirements. Instead of interfering to make repudiation easy for these bodies, it is the plain duty of Congress to arm the national courts with whatever additional powers are necessary to be used in bringing them to a sense of their legal obligations.

OPTIMISTIC PESSIMISM.

THE angry way in which the Stalwarts every now and then speak of Mr. Hayes's "serenity" and hopefulness and "amiability," especially with regard to Southern matters, is a good illustration of the intolerance which is so often to be found even in the best optimistic circles. In fact, it is safe to say that a completely optimistic or completely cheerful person is hardly ever to be met with. It will be generally—indeed, almost invariably—found on close examination that the very best optimist keeps a gloomy corner in his mind to which he retires and revels in foreboding when he thinks nobody is watching him. It is not always easy to find out where he keeps it, or, in other words, what is the precise matter about which he is despondent; he is often as expert and vigilant in concealing it as those monomaniacs who have only one small screw loose and successfully resist all attempts to uncover it. Cases have often occurred in which an undoubtedly insane man has baffled for hours the efforts of able lawyers to lead him to lay bare his infirmity, and persons who make a specialty of cheerfulness sometimes display the same curious defensive cunning. There are, however, very few of them who keep up appearances to this extent. They generally make no secret of their anxiety; but, no matter how hopeful they may be in general, and how highly they may rate and inculcate a hopeful habit of mind, there is nothing they have less patience with than hopefulness about things of which they themselves despair. Their irritability and exactingness on this point are curiously like the impatience of early risers with people who lie late abed. The early riser, as a rule, maintains that the pure air, the silence, and the freshness of the morning quiet his nerves and raise his spirits, and give him a buoyant attitude towards the world and a kindly feeling towards his fellows. But if you press him hard, you are apt to discover that the failure of the rest of his household to get up as soon as he does secretly destroys his peace, and that he would, if he could, drag them all out of bed and make them share his enjoyment. He cannot understand how they can be indifferent to what he himself likes so much, and ascribes it to sloth and culpable self-indulgence.

The professed optimist, too, generally selects some one tendency of society or some class of persons as very hopeless cases, about whose future it is unseemly or foolish or wicked to take a cheerful view, while about that of everything and everybody else he displays a boisterous confidence in the future. The average Stalwart, for instance, is nothing if not a cheery American, who loves "the bright side of human nature," in general terms thinks his own country a happy place for rich and poor, in which all things are sure to be for the best, and in which man, of whatever race, is almost certain to grow in virtue and in knowledge. If you go into particulars with him, however, you find out speedily that he thinks about 12,000,000, more or less, of his countrymen are in a condition of the most frightful suffering and insecurity, with little or no prospect of improvement, and that 8,000,000 of these are not only cruel, idle, and vindictive, but so degraded, morally, that the only way to get them to behave decently is to stand guard over them with a musket. Sometimes, when he is more than usually downcast, he ventures on the opinion that they might as well all be killed, as it is useless to expect any of the ordinary civilizing agencies to produce any effect on them. If you suggest that, as all other races have come up out of barbarism through the education of circumstances, perhaps the Southern whites may do so too, he eyes you savagely, and asks whether you have ever been down amongst them, or whether you remember the conduct of the slaveholders in Congress before the war? Even at this point, however, by dexterously turning his attention to the Northwest or to New England, you can make him burst into triumphant song, and denounce Northern jails as places of needless and unjustifiable restraint. With Mr. Hayes he has no patience. His smiling, placid way of talking about "outrages" and the probability of their disappearance through natural agencies, almost infuriates him. He is willing that the Chief Magistrate should be cheerful about everything else, but on this point he demands deep gloom, as something due to the Republican party, which he maintains is essentially and fundamentally a gloomy, anxious party, and as such is entitled to a dismal President.

It is not about the South only, however, that he exacts despondency. He is apt to be equally exacting about any work or movement in which he is strongly interested or in which he is actively engaged. To keep up his enthusiasm about it, it is, of course, necessary that he should entertain a passionate belief in its necessity, or, in other words, feel certain that great mischief, or even ruin, would result from its abandonment. To have you come along smiling and cheerful, and declare *your* belief that he might safely let the matter alone, and that the problem will probably be solved by the mere course of events, is more than he can bear. There is no use in your protesting that you are as much interested in the subject as he is, and that you only differ with him as to the means of bringing about the desired end; he will not believe you. Your cheerfulness about it is in his eyes simply a cloak for indifference. If you were sincere, he feels sure you would look and talk sadly about it. Nor can you get off by pleading that you are sad about something else; that if, for instance, you are not as gloomy as he is about the Moderate Drinker it is because you are greatly depressed about the "little health" of women. He knows that there is nothing in the health of women to cause anxiety to a rational mind, while the state of the Moderate Drinker plainly calls for the prompt action of the whole community through its thinkers, its presses, its judges and policemen. He, on the contrary, having a clear head, is very cheerful about the health of

women. He says what makes all the fuss and talk is the fact that it is in a transition state; that what we are witnessing is the evolution of a new type of women, in which the mental and physical powers will be more equally balanced; that the wise course for croakers about women to follow is to let her alone, and let her adapt herself to her surroundings. In fact, he would let everything and everybody alone but the Moderate Drinker, whom, he confesses, he would like to clutch, and whom he constantly weeps over. Whenever he sees him walking down the street he feels sure he is making straight for a rum-shop, and always regards a protuberance in his coat-tails as indicating the presence of a bottle.

Another marked feature in the condition of the pessimistic optimist is his strange mixture of scepticism and credulity. For all "stories" which go to justify his gloom he has the greatest tenderness, and treats the paper which supplies him with them as a sort of second Bible. He thinks the editor must be a good man, and determines to call and have a look at him whenever he visits the city, and thank him for "the noble work he is doing." A very horrid story he now and then pronounces "worth the whole price of the subscription." The more improbable it is —that is, the more nonsensical and atrocious—the readier he is to believe it, because it justifies his previous impression about the wretches who figured in it. He knew already that they were capable of anything, and here is the proof. A story was supplied to the English "Jingoes' the other day about the Russian officers in Bulgaria having laid a wager on the sex of an unborn child, and then killed the mother to decide it. They appear to have swallowed it whole, as it fitted into their conceptions of the way the Russians passed their leisure time in the field. In like manner our Stalwart devours any story from the South which is very revolting. The grossness of its barbarity, instead of putting him on the enquiry, or making him hesitate, is the mark of its authenticity, and secures it a place in his pigeon-hole. If the refutation should come up pretty soon, he shrinks from it as from a draught from an open window, and if pressed too hard, comforts himself with the conviction that if they didn't do this particular thing they did something else just as bad.

On the other hand, disagreeable stories about other things fall off him like water off a duck's back. He hates a censorious, carping press which is always finding fault with our public men (except Hayes), and does not believe a word of stories about their railroad operations and jobs and peculations. He hates, too, the people who open their ears to those things, and are ready to believe them and pass them on. He thinks the best plan is to look at the bright side of human nature, and avoid scandal and tittle-tattle. He wants to know how any decent man can be expected to serve the state if charges of this kind are to get credence from respectable people? But even if they are true, what is the use of groaning and mourning over it? The bottom is not going to drop out of the Republic even if members of Congress are not very pure. Look at England in the days of Robert Walpole. He has no patience with this slanderous spirit, and pities from the bottom of his heart a man who can find nothing better to do than collecting the lying gossip of partisans. He thinks we all have enough to do watching and recording our own sins, without following those of other people with too greedy an eye, and punches you in the ribs and advises you with a laugh to have more confidence in your fellow-men. Look at the sunshine, he says; how green the grass is, and how blithely the birds sing.

THE INDIAN BUREAU TRANSFER.

WASHINGTON, Dec. 28, 1878.

THE evidence taken by the Joint Committee which has in charge the consideration of the proposed transfer of the Indian Bureau to the War Department, promises, when published in full, to be of a good deal of interest. As far as it has gone it shows that the question is surrounded by difficulties of which the public have little knowledge. If there can be said to be any public opinion in the civilized portions of the country on the Indian question (there is, of course, plenty of opinion of a certain sort on the frontier), it may be described on the one hand as regarding the Indian with a spirit of philanthropic benevolence, on the other as looking upon the system of government applied to him with profound distrust. The majority of the people and their representatives in Congress without question wish well to the savages, and would gladly have the best care taken of them, and have them civilized and converted from nomads into industrious citizens. There is a strong conviction, too, in most people's minds, that they have been wronged, that they have had their lands taken away from them, their hunting-grounds occupied, and their very existence from day to day made unhappy by the encroachments of civilization. To a savage whom the United States undertakes to convert from the paths of barbarism, with its attendant excitements of unlimited rapine and slaughter, there is certainly due a guaranty of the quiet pursuit of his new life; but it must be confessed that this obligation has not been always discharged. But why has it not been discharged? Most people would answer that there are two chief reasons—first the tendency of the frontier white population to encroach on the lands of the Indians, and to provoke Indian wars with a view to getting some of their lands; and second, the corruption, waste, inefficiency, and favoritism which have characterized the management of Indian affairs. Of course the first difficulty is included in the second, for frontier aggressions ought, if the general management of the Indians were what it should be, to be kept within limits which would prevent their ever becoming the cause of serious disturbances. Consequently, most people who have made a cursory examination of the Indian question have come to the general conclusion that the first thing to be done with the tribes is to hand them over to some other governmental agency than the Interior Department. General Grant, who, when he was first elected President, had given some consideration to the Indian question, and was something of a reformer, thought he might accomplish the end in view without any radical change, by giving the appointment of the Indian agents (hitherto political and rotatory in character) to the religious societies, and this original piece of civil-service reform he managed to incorporate into our Indian system. Unfortunately, however, his zeal for reform began to die out before he had noticed the fact that the purification of the agencies was out of the question unless the centre of the whole system—the Interior Department itself—was first pure. The final effect of his reform, therefore, after the public had become familiar with Mr. Delano and his mode of working the "machine," was not to justify itself, but to bring discredit upon the religious societies and their representatives. This added strength to the popular and Congressional conviction that what was needed was no half-way measure, but a sweeping change; a new system. Hence, since Delano's time there has been a steady growth of sentiment, as shown in the newspapers and in Congress (finally leading to the appointment of the present Joint Commission), in favor of the transfer of the Bureau to the War Department.

The arguments in favor of the change are all very simple. Experience, it is said, has shown that the management of the Interior Department is not satisfactory. Therefore some change is necessary. The Army is familiar with the Indian question, and has no interest in stirring up Indian wars—not even a professional one, for of all kinds of fighting an Indian war is the least attractive. Neither has it any interest in getting hold of lands, nor in "operations" in cattle or other supplies. Its officers are subject to no political dictation, cannot be removed for doing their duty, can be cashiered for any violation of duty, and are subject to a rigid discipline. If the Indians were given over to its charge, they would find themselves dealt with according to a set of fixed rules, honestly administered, from which there would be no escape, and they would have an example set them of orderly behavior, discipline, honesty, and last, not least, neatness and cleanliness, which, in its civilizing effect, would be invaluable.

It must be remembered, by the way, that the notion of civilizing the Indian is not mere philanthropic sentimentalism, but that the attempt has been made in certain instances with success; as, for example, in the Indian Territory, where there are whole tribes, formerly nomadic and predatory, now converted to steady agricultural habits. Of course this cannot be done with the first generation. To be civilized the Indian must be "caught young." But the fact that the work of civilization has been proved practicable in certain instances should never be left out of sight, and the theory of certain amiable persons, that the real solution of the Indian problem is extermination, ought not for a moment to be entertained. No such process as extermination is going on, so far as is known by those most competent to express an opinion on the numbers of the Indian population. Indeed it is generally believed here now that there are quite as many, if not more, Indians in the country than there were fifty years ago.

But granting that the Indian is not to be exterminated, and is to be both governed and civilized, the question recurs whether the Army or the Interior Department is the best agency for the purpose. As to this the abstract arguments have already been given; but they clearly must be tested by the light of experience, and it is here that the testimony now being taken becomes of value. Mr. Schurz has been before the Commit-

tee and given some evidence the force of which those who favor the transfer will find it difficult to overcome. In the first place, in reply to the argument that the Indians would be better taken care of by army officers than by civilians, he urges that this depends upon what sort of care is meant. If they are merely to be herded together and watched, and prevented from going on raids, the officers of the Army are just the men for the work; but if the object of the Government is civilization; if the duty of those who are placed over the Indians is to teach them to till the soil, to sow and to reap, to educate their children and gradually accustom them to the ways of individual as opposed to tribal life, the army officers are not well fitted for the work. They are not accustomed to educational work of this sort, have not the patience for it, and could not be expected to take any interest in it. To fortify this position he was fortunate enough to be able to cite a report made not long ago by high authority, couched in the following language:

"This brings us to consider the much-mooted question whether the Bureau should belong to the civil or military department of the Government. To determine this properly we must first know what is to be the future treatment of the Indians. If we intend to have war with them, the Bureau should go to the Secretary of War. If we intend to have peace, it should be in the civil department. Under the plan which we have suggested the chief duties of the Bureau will be to educate and instruct in the peaceful arts—in other words, to civilize the Indians. The military arm of the Government is not the most admirably adapted to discharge duties of this character. We have the highest possible appreciation of the officers of the Army, and fully recognize their proverbial integrity and honor; but we are satisfied that not one in a thousand would like to teach Indian children to read and write, or Indian men to sow and reap. These are emphatically civil and not military occupations."

This report, made by the Sioux Commission, was signed by General Sherman, General Harney, and General Augur. General Sherman is now strongly in favor of the transfer.

In the second place, Mr. Schurz insists that the popular impression that the civil administration of the Indian service is responsible for the Indian wars is altogether a mistake; the real cause of most of them being the breach of treaty stipulations, or encroachments of some sort by the white frontiersman. (It may be mentioned in corroboration of this that it is understood that at the present session of Congress a determined effort will be made, in the interest of a well-known Western railroad, to have the Indian Territory "opened up," in flagrant violation of treaty rights, and the House of Representatives has already taken the first step in this direction by adding a clause to the Indian Appropriation Bill forbidding the removal of any more Indian tribes to the Indian Territory without special legislative authority.) Mr. Schurz also cites several well-known instances of Indian wars as admitted not to have been brought on by the Indian Bureau; *e.g.*, the Seminole War, the war with the Sacs and Foxes, the trouble with the Creeks and Cherokees, the Sioux War of 1852–4, the Navajo War, the Cheyenne War of 1864, the Cheyenne War of 1866–7. To these he adds the Black Hills, the Modoc, and the Nez-Percés wars; the troubles with the Apaches, the Bannocks, and the Northern Cheyennes.

In the third place, Mr. Schurz denies emphatically that the business methods of conducting the service under the War Department would be any better than under the Indian Bureau, and to establish the improbability of this he brings forward the curious fact that the transfer of the Indians to the Interior Department in 1849, before which date they had been in the hands of the Army, was in great measure caused by the scandals connected with the Army management. He produced before the Committee a report of a committee of the House made in 1842. This committee declare that the "accounts of the Indian funds" at that time had been "kept with unpardonable negligence," and add:

"The evidence is submitted as to the general management and present condition of Indian affairs, and it requires little comment. It exhibits an almost total want of method and punctuality, equally unjust and injurious to the Government and to the tribes to whom we have voluntarily assumed obligations which we are not at liberty to disregard. It will be seen that the accounts of millions of expenditure have been so loosely kept as scarcely to furnish any trace or explanation of very large sums, and that others have been misapplied, so as to impose serious losses upon the Indians and heavy responsibilities on the Government; that in some books (the only record kept of these accounts) no entries have been made for a period of several years, and that when entries had been made they are so imperfect that the very clerks who kept them could not state an account from them."

In addition to this Mr. Schurz cites many curious facts—as, for instance, that "there is not a single bound volume of records referring to the land interests of the Indians that has come from the War Department to the Interior Department." Some of the evidence is very amusing, particularly that with regard to the removal of the Cherokees to the Indian Territory, from which it appears that the actual cost of removal per capita was $103 25, although a contract was made to remove at $10 a head. Among other things, it appears that each Cherokee had six pairs of shoes at $2 a pair. This sort of thing had been going on for a long while, for by another report made in 1833–4 the most startling revelations as to the difference between prices of articles delivered to Indians and the market prices were made. A blanket costing in St. Louis $4 would be sold on the Upper Missouri to the Indians for $12; the price of gunpowder would become inflated from 30 cents to $1 50 per pound; tobacco from 5 cents to $1 a pound; and whiskey from 25 cents to $16 a gallon. This evidence, of course, all goes to show the curious fact that the demand for the transfer of the Indian Bureau from the Interior to the War Department is founded upon precisely the same arguments that thirty years ago led to its transfer from the War to the Interior. In fact, the management of Indian affairs appears to have a necessarily corrupting influence upon whatever branch of the Government undertakes it. Under Mr. Schurz there is no doubt that it is purer than it has been for years—in fact, probably as pure as it can be made. But the number of abuses he has himself brought to light are a discouraging commentary on the system. Those who have looked forward to the transfer to the War Department as a final solution of the Indian problem will find that Mr. Schurz's testimony makes it clear that there is room for difference of opinion on the subject. The Joint Committee's report, it is to be feared, will not carry great weight whichever way it decides, for it is not made up of members who have any special familiarity with Indian affairs.

EMPEROR WILHELM'S RETURN.

BERLIN, Dec. 6, 1878.

AFTER an absence of more than four months the Kaiser returned yesterday to Berlin and formally resumed the imperial authority, which in the interim had been in the hands of the Crown Prince. The former had expressly requested that there be no military display, and that the total cost of the civic ovation be no greater than when he returned from France with the army in 1871. Despite the hard times, however, the latter request was disregarded, and it is estimated that more than a quarter of a million marks were expended in festoons, banners, cartoons, gas-jets, candles, etc. Many places of business were closed, a holiday was decreed for the University and all the schools; and students, with more than a score of citizens' clubs and societies of veteran soldiers, with banners and music, marched in procession to their positions as *Spalier*- (or fence-) guard, in front of the iron rail which encloses the central portion of the five-fold street, Unter den Linden. This portion was kept clear for the imperial carriages, while on either side a dense mass of men, women, and children waited in quiet expectation for several hours. At length, at one P.M., the Emperor and Empress, seated side by side in a plain, open carriage, bowing right and left, and saluting the American flag, under which nearly fifty American students had been gathered, were driven along so rapidly that the crowd had hardly time to cheer, the bells to ring, or the bands to begin to play, before they were past. The Crown Prince with his family, Von Moltke, and a few ministers and other notables, followed—nothing more. The general feeling of relief from a great but unnamed fear was visible on every face, and found expression in countless ways when the Emperor was safely in his palace. Though every precaution had been taken; though the fanatical Fritzsche and nearly fifty other Social Democrats whom the Government believed to be sincerely in earnest in their opinions, had been banished from the city limits under the new laws; and though a general police inquisition not only of the passports but in some cases of the private life of suspicious foreigners had been made; and though Madai is said to have overworked his whole immense force of secret and of uniformed police, it was never forgotten that some crazed enthusiast, or the victim of a lot cast in some undetected treasonable society, might be willing to sacrifice himself on so great an occasion. In spite of fears and predictions to the contrary, however, the policy of forcible repression seems now to have reached a successful culmination. Up to the present date about one hundred and fifty Socialistic societies, and forty periodicals, and one hundred and thirty-five non-periodical publications, have been suppressed under the recent laws. It is said that the Crown Prince believes still more firmly in the policy of repression, although it is generally admitted that during his brief administration the laws were executed strictly in accordance with the spirit and unexpressed wishes of his royal father.

Of course, much not only of the official but of the private ostentation

on such an occasion is simply business. Enterprising firms vie with each other in the taste with which their buildings are decorated, or in the brilliancy of their illuminations, which are all chronicled in great detail by the ordinarily dull and unenterprising Berlin newspapers, the editors of which, by the way, are for the most part Jews. Yet no one at such a time can for a moment doubt the depth and sincerity of the national patriotism, and of the personal love and reverence for the Kaiser which allies itself so readily at every point with religious sentiments, as may be seen in the mottoes on the street, and in the crowds which will attend the church-services to be held on Sunday in thanksgiving for the Emperor's recovery and return. A large tobacco firm displayed an elaborate transparency with the words, "Despite tobacco-tax and monopolies we dearly love our monarch." All parties—even the Catholic Church, by illuminations and a *Te Deum*—joined in the festivities. Some of the more conspicuous of the former we noted down, viz.:

"May each of the million and a half candle-flames in the windows of his subjects to-night be a blessing realized upon the head of our dear Emperor William I." "All these outward festivities do not express the joy of our hearts, nor the deep pious love of the people for their brave monarch, who has looked death in the face on many a battle-field, and who has watched in pain for us while we were sleeping." "This is a day of glad tidings." "Those who wait on the Lord shall renew their strength." "Let all men now praise the Lord." "The first citizen of the kingdom, the father of his people, the strong fortress of Germany." "Hail to him whom God has preserved; may He preserve thy going in and thy coming out."

In a brief address at the depot on his arrival the Emperor declared that, painful as his wounds had been, the thought that in Prussia, and in his own dear city of Berlin, a subject had deliberately planned to take his life had caused him still deeper pain; that event, however, had revealed sore spots in the body politic which could be healed only by the strong hand of law; if this could be effected, he was glad to have bled for the general weal. Soon after reaching the palace the Emperor dined alone, composed a private letter of thanks to the Crown Prince for the fidelity of *his* short administration, attended with the imperial family a short thanksgiving service in his private chapel, conducted by the court chaplain, Koegel, and witnessed the illumination in the evening. In spite of his wounds and his age—nearly eighty-two—he looks as hale and vigorous as he did ten years ago. He is a man of very simple and purely soldierly tastes and habits. But for the numerous elaborate presents from the Emperor of Russia, his private rooms in Berlin, which many have been allowed to see during his absence, are more simple than not a few New York parlors, and his private library is exclusively military. That one of the mildest, most amiable and venerable monarchs of Europe should be peppered in the back by rabbit-shot (as the late *attentat* was recently described by Bismarck in the Reichstag) is, indeed, bad enough; but the aristocratic reaction in public sentiment has been so great, and has been so dexterously utilized by the imperial cabinet, that it is probable that if Socialism is the dangerous secret international organization it is often feared to be, some other country than Germany will be chosen for the present as the field of its active operations.

In a country so much governed as Germany it is inevitable that the lower classes should infer that the Government is somewhat responsible for a general lack of business prosperity. We must not judge the Social Democrats entirely from their printed programmes. Most of them believe that all rich men and the nobility are their enemies, and hoot and jeer at every liveried carriage (as they did a short time since in Tegel at the ordinary diplomatic equipage of the American minister), without having any sort of theory of the relations between labor and capital, and without any thought or suggestion, even as naïve as that of the unlimited issue of cheap money, respecting the ways and means of reform. They do not for the most part stand to their leaders in the relation of an intelligent constituency, nor are they as a body desperate or disloyal enough deliberately to plan, or even to wish, regicide. But French gold and the sudden expansion of the national spirit, the great influx of population from the *Dörfer* to the larger towns, increasing competition, the inflation of business, and the degeneration of the *morale*, and then the inevitable reaction, bringing hard times and high taxes, etc., all these have unsettled old ways and notions, and bred widespread discontent. It is the old, old tragedy of history—an ignorant but contented and industrious proletariat disquieted in mind if not in fortune by too great a change of surroundings, or by too sudden an influx of new ideas and ambitions. The religious press speaks of the attempted assassination as both the logical and the practical issue of the Socialistic spirit, and this it ascribes to the current materialism of modern times, which has so destroyed moral vigor, high enthusiasms and ideals, that men prefer pleasure and possession to duty and virtue.

It is very difficult for an American to understand the religious condition of Germany. There seems everywhere to be a strong reaction against the naturalism of the founders of the Tübingen school. The cruder and undiscriminating forms of unbelief which are intolerant of Bible, church, and creed are found no longer except among Socialists. Among the clergy of the Lutheran Church there is the greatest diversity of sentiment and opinion, ranging from the philosophical rationalism of Strauss to the straitest sort of orthodoxy. A prominent clergyman lately complained to the writer that during the last twenty years, while Berlin had doubled in population, only two new churches had been built, and that the effects of the anti-Catholic agitation had been disastrous to religion, because both ignorance and malice had too often classed both faiths together, and thereby brought both into a sort of common disrepute; and because when the Catholic clergy, who are often only *Seminaristen*, were required on taking orders to pass an examination in the rudiments of science, the university-trained Protestant candidates had to do the same. It is estimated that only from two to four per cent. of the population of Berlin may be found in the churches on Sunday, and these chiefly women. Preachers have nothing to say about doctrine, but address themselves to "practical life," by which they mean the *Gemüth*. Although the religious sentiment in the Teutonic heart is strong and ineradicable, it exists there independently of and indifferent, or else positively hostile, to even Scriptural dogma. A cultivated mother of a large family, *e.g.*, a clergyman's daughter, and a very constant churchgoer, rather surprised her husband the other day by saying in answer to the writer's questions that she never had believed in the miracles of the New Testament, nor in a personal immortality. Religious belief and rites are considered as æsthetic formulizations of pious feeling, and as a most essential part of the ideal side of life and culture, identified in its essence with the higher forms of art, and in its interests (as opposed to the modern materialistic philosophy of science and the understanding) with the idealistic and absolute philosophy of Fichte, Schelling, Hegel, etc., which have been so shocking to most American orthodoxies. Methodism, represented here by a little chapel with a congregation of less than forty, is absolutely unintelligible to the German mind. But, on the other hand, popular newspaper argument in favor of the English-American Sunday as a philosophical institution, bringing rest and inviting reflection, to which these nations owe so much of their business prosperity, has attracted considerable attention.

Let me remark in closing that it is most refreshing to an American to observe how thoroughly respectable and cultivated most of the political leaders are. There is hardly a "self-made" man in the Reichstag. They are mostly men whose political convictions spring from and are intrinsically and systematically bound up with their personality and with their whole philosophy of life, so there is no question about their "record." There is no snatching at transient issues to win a transient fame. There are eight distinct parties represented in the North German Congress, and I cannot conceive of a discussion more pointed, briefer, more vigorous, all-sided, and exhaustive, yet more ineffectual in changing votes, than that on the recent anti-socialistic laws which I was privileged to hear.

PARLIAMENTARY GOVERNMENT IN ITALY.

ROME, Dec. 12, 1878.

THE Cabinet Cairoli-Zanardelli has ceased to exist. Last night, after the longest sitting I have ever witnessed (from one to eight o'clock), and before the fullest house ever yet seen in the Italian Parliament (457 out of 512 members), the Ministry was defeated by 263 votes against 189. The telegraph will have informed you, before you receive this, what will be the consequences of this vote, which party or fraction will take office, and whether a dissolution of Parliament will ensue or not. I limit myself to giving you an explanation of the facts which occur, and, as it were, a commentary upon, not a history of, these facts. The causes of the event which has taken place are twofold: parliamentary and extra-parliamentary. However uninteresting the personal squabbles and intrigues may be which constitute parliamentary life in Italy, I must touch upon them lightly in order to make things clear to the American reader, before I can dwell upon the deeper evils of the state.

The Italian Parliament, like the French under Louis Philippe, like the present German Parliament, has always labored under the "fraction

disease." Instead of two principal parties, as they exist in England and Belgium, there have always been five or six groups, each of which represents a minority, and can only hold government as long as the coalition lasts which brought it into office. There is, however, a very great difference between Italian and French or German "fractiondom." In Italy principles have nothing to do with it; and the talent with which personal interests are disguised under the clothing of general interests is very small. From 1860 to 1876 all the different shades of the so-called Right succeeded each other in office; from March, 1876, till now three different groups of the Left have alternately been in possession of power: the Neapolitans under Nicotera, the Sicilians under Crispi, and the Lombards under Cairoli; all three directly or indirectly backed by the old Piedmontese Left or Rattazzi party, the principal survivor of which is old Signor Depretis. These four fractions are divided from the Centre and the Right, not by their opinions, nor even by their way of exercising power when they had it to exercise, but only by the district, the class of society, and the political school they came from. Italy was made by the combined efforts of the dynasty of Savoy and the Revolution, Cavour and Garibaldi; these two forces have co-operated, they have never completely coalesced; all those who passed through Cavour's apprenticeship have kept something of his spirit, while all those who served under Garibaldi have retained a political temperament which is not very compatible with the regular conduct of affairs. This the latter indistinctly feel, and therefore have always courted the alliance of the small party which from 1849 to 1859 sat on the left side of the Piedmontese Parliament. Circumstances brought it about that Mazzini and Garibaldi found more adherents in Lombardy and the two Sicilies than in Piedmont, Venetia, Tuscany, and the Romagna, the consequence of which was that the left side of the house consisted in the main of Southerners and a small group of Lombards, the right of Northerners and men from Central Italy. Once in power, however, the policy of all Italian fractions has always been more or less identical. Not only Crispi and Nicotera, but also Cairoli and Zanardelli, forgot their republican antecedents and became as stanch supporters of the monarchy as the men of the Right ever had been. Liberty, or, I ought to say, license, was as unlimited under the seven ministers of the Right as under the three of the Left; public security was as insufficient under the one as under the other; the foreign as well as the ecclesiastical policy was exactly the same. Of reform—be it in justice, public instruction, army, or administration—there was as little before 1876 as after, nor was there much to choose between the petty jealousies of Signor Minghetti and Signor Sella and those of Signor Crispi and Signor Nicotera, unless it be that the former, being endowed with a better breeding and a cooler temper, showed less cynically than the latter the personal motives which prompted them, and took to less coarse weapons to fight their personal quarrels. One great difference, however, really exists between the two sides. The Moderate party managed the finances of the state with energy, order, and foresight, and thereby saved the country from bankruptcy. The Radicals have succeeded in three years' administration in bringing it again to the brink of failure by weakness, want of order, and craving for popularity. The abolition of the mill-tax, which yields nearly one hundred millions, has been proposed by the present Cabinet and voted by Parliament. If a second vote does not annul the first, the state will soon find itself in the condition in which all the principal cities of the kingdom are—*i. e.*, obliged to suspend payment.

The means by which one fraction of Parliament is wont to overthrow the ruling one by coalition with former enemies are well known. As soon as a favorable opportunity arises, or a plausible pretext offers itself, the chief of such a fraction enters into secret negotiations with the chiefs of the other fractions; the question on which they have determined to attack Government is raised and the assault given. It was Crispi who thus overthrew Nicotera; Nicotera who put himself at the head of the intrigues by which Crispi fell. Both seemed the most desperate personal enemies two months ago, had accused each other of the vilest acts: Crispi accused Nicotera of being a *Camorrista* (head of a species of trades-union); Nicotera made out the case of Crispi's bigamy. But, lo and behold, both united last week in order to overthrow the Cairoli Cabinet, whose fraction had helped them in turn to climb to the top. The Right, without entering into any conspiracy, has simply voted against the Ministry, as it did against the two former ministries of the Left. The pretext this time was a plausible one. The attempt on the King's life and the atrocious crime at Florence had deeply agitated the whole country, and, although the same facts would have certainly occurred under any of the preceding ten ministries Italy has numbered since it became one kingdom, the present Cabinet was made responsible for them; and this brings us to the other and deeper side of the question: Why all these ministerial crises? why does parliamentary government give such painful results in Italy? is there any hope of things getting better in course of time?

"Laws ought to be so adapted to the people for which they are made that it is a very great chance if those of one nation can suit another," says Montesquieu; and in these words lies the whole explanation of the Italian riddle. Italy in 1860 was neither ripe for unity nor for parliamentary government. Europe has applauded it and admired how it made so great a revolution, not by force, but by free consent; not with discipline, but with liberty. Europe can see now, what every man whose sight was not obscured by liberal and democratical watchwords might have seen from the first day: that liberty has founded nothing in this country, neither a monarchy, nor an army, nor justice, nor wealth, and that everything is still to be done.

Italy was not ripe for unity, because the South was and is two centuries at least behind the North in civilization. Not only is the morality of a Nicotera and a Crispi a different kind of morality from that of a Cairoli or a Minghetti, but the whole population on the other side of the Tronto has a different view of morality from that on this side. Things which would dishonor a man in Milan or Florence are looked upon as trifles in Palermo and Naples, and what a Piedmontese or a Venetian would consider as indelicate is the daily bread of private and public life in the South. Here the *reati di sangue*, or crimes of blood, so frequent all over Italy reach four times the number of the North. The same difference exists between the intellectual culture of both halves of Italy. For although the bearers of some of the best names in literature, such as Amari, Bonghi, Villari, are Sicilians and Neapolitans, they feel themselves quite isolated in their own country, and prefer to live in the more congenial atmosphere of the North. But it is principally general education which is so inferior in the South that it is difficult to recognize in the Neapolitan *mezzoceto* countrymen of those Tuscan and Lombard middle classes who, on the whole, are quite on a par with the French bourgeoisie, nay, even too exclusively reared upon French culture. There is still something else, however, which divides Italy into two heterogeneous halves, and that is the thrift and industry of the North, and its consequent relative wealth. Whilst few parts of Europe offer a more developed agriculture than Tuscany and the Romagna, a more advanced state of manufactures than Piedmont and Lombardy, the most fertile districts of Calabria and Sicily lie barren; the misery of the peasants and the town-poor is heartrending; manufactures, except where carried on by strangers, as the wine-manufacture of Marsala, are in their infancy. The consequence is that it is North Italy which is by far the wealthiest part of the country, and the part on which taxation bears most heavily. Now, whilst there was a tolerably good railway-network in the North when the kingdom was founded, nothing has been done in the South, and the same thing may be said of high-roads, of trade-ports, etc.; and as there was no private capital or individual initiative to come forward, it was the state that had to do the greater part of all this, at what cost the yearly budgets of the kingdom may well tell; with what profit, the fact that all the railways of the country are worked at a loss, even those which previously prospered, shows but too clearly. If you consider that things are in the same condition with regard to the schools, the army, the police, etc., you may imagine the sacrifice Northern Italy made when it consented to unite with Naples and Sicily—a sacrifice, however, made less out of generosity and patriotism than out of ignorance of the real state and dread of unpopularity. Nobody, not even Cavour, had the courage to refuse Garibaldi's fatal gift.

Italy was not ripe for parliamentary government, and what in England was the work of five centuries has been done in this country in the space of a fine summer night. Whilst the crown under King William III.—nay, under George IV.—still had a considerable influence on the policy of the country, in Italy the Lower House of Parliament was omnipotent from the birthday of the new state, whose population the day before were still groaning under secular despotism—cruel in Naples, bigoted in Rome and the Romagna, enervating in Tuscany, foreign in Lombardy and Venetia. And of what elements was this Parliament composed? Was it an ancient aristocracy trained for centuries to the state service? Was it a higher middle class wont to administer their native cities or villages? Nothing of the sort. The electoral law published in 1859 and 1860 gave a vote to every man paying 40 lire ($8) taxes, local taxation included. Now, when in a country the income tax reaches 13.20 per cent., the taxes on buildings 53 per cent. (*sic*), when every shopkeeper pays for his "patent" besides his "family tax," the results of such a law must be that the elections are entirely in the hands of the

lower middle classes, who but yesterday awoke to political life. The consequence was and is that Italy, both locally and at its centre, has for these last eighteen years been exclusively ruled by those classes represented by lawyers. What has become of the local finances in the hands of this unlimited self-government the financial state of Florence and Venice, Ancona and Naples, tells but too eloquently, even to the distant public. But what the distant public does not see is that the taxpayers get nothing for their money; that schools, illumination, police, above all, are monstrously behind the times, whilst splendid theatres, costly pleasure-grounds, and the like have risen as by a miracle out of the ground everywhere. And worse than this, in the southern towns, for the most part inhabited by poor peasants, who pay patiently the heavy *octroi*, nothing is received in return from the ruling class, who have the administration not only of the municipal funds but of all pious foundations, and appropriate them in the most shameless way for their own benefit and the benefit of their families.

If at least the central government had been able to do something towards bracing the relaxed nerve-strings of public life; but, alas! the omnipotence of Parliament and the necessary train of concessions, favors, promises, which it brings with it, paralyzed even the little that remained of the good old Piedmontese, Austrian, and Tuscan bureaucracy, which, however inferior it may be to the French and the German, represented and defended nevertheless alone the general interest of the country against all the local and personal interests conspiring against it. Except Sella, who, it must be recognized, never shirked responsibility and always stood up manfully for the financial officials under his order, naturally the most unpopular of all, no minister ever had the courage to back his inferiors against the demands of the parliamentary influence. So it came to pass that even bureaucracy has degenerated since 1860, has become from day to day more remiss, from day to day more prone to decline every responsibility, and even, it is sad to say, less honest than it used to be.

Nor does it stand better with justice than with the general administration. Italian justice never has been very brilliant, and this country, which gave birth to juridical science, and where its standard is still kept so high, has practically had a body of judges inferior to any other country in Europe. The number of these wretchedly-paid magistrates, recruited, not as in England, where the bar is always considered as the highest profession after the clergy and army, from the higher middle classes, but from the clients of great noble families—their number is legion, which, however, by no means accelerates the expedition of justice. If *Hamlet* were to come back to the world he would still find in Italy "law's delay" as flourishing as it was in Denmark in his own time. The duration of trials, people spending sometimes two or three years in prison before they are judged, and, as it may happen, acquitted, is equalled only by the leniency of punishment. For, unfortunately for the security of life and property, trial by jury was introduced in 1860, in this country where the judges themselves often lack moral courage enough to confront the threats of the criminals or the influence of their friends. But even when witnesses have been found courageous enough to give evidence, even when the *rara avis* of a jury ready to condemn a man has been met with, where is the judge who would venture to inflict a sentence of capital punishment, knowing the state of public opinion, which will not hesitate to fling the usual epithet of "executioner" in his face? And were such a judge to be found for once, the Minister of Justice would most surely exact from the King a pardon, and the criminal wanders quietly back into a prison so loosely watched that he would have little difficulty in escaping under the very nose of his jailers after a year or two.

Everybody knows these abuses and complains of them, but who thinks to remedy them? Not certainly Parliament, always occupied with intrigues; not parliamentary government, always busy seesawing and endeavoring to find its centre of gravity. Is it to be wondered at that the *Mafia* reigns supreme in Sicily, the *Camorra* in Naples, the *Sette* in Romagna, the *Internazionale* in Florence—that Republican clubs should be rife throughout the country? And all this is of long standing. It began years ago, and has become worse and worse, more and more audacious; but it would have developed quite in the same order under a "moderate" government. One would be greatly mistaken, nevertheless, if one believed that the country connives with the Republicans and the Internationalists, the *Mafiori* or the *Camorristi;* the immense majority ardently desire to be free of them. It would acclaim any government which should find in itself the energy necessary to put a stop to the existing terrorism. It is a handful of maniacs and criminals and a certain number of young students and workmen in the towns—don't forget that Italy is an agricultural country and counts few city operatives—who form the kernel of this army of disorder. But the Government would have to act alone. That "immense majority" which sighs for deliverance from the criminals who alarm it, from the *affaristi* who squander its money, from the low press which sustain both—this majority is by no means willing to back the Government by assisting it courageously. It expects the rulers to do everything by themselves, perhaps only to sneer at them after having been freed by them.

Now, what can Government, what can the King, do to clear the situation? A *coup d'état* like the 18th Brumaire or the 2d of December is out of the question. Italy wants still to maintain parliamentary government, and the army is becoming unreliable. The great accession of Neapolitan troops and Garibaldian volunteers had contributed greatly to shake the iron discipline of the excellent little Piedmontese army. Since then, however, the army has improved slowly but surely. It was in high favor with the country, and it was the best school for the nation, infinitely more effective and wholesome than Parliament, elections, free-press, clubs, and even schools. It is only due to justice to say that the Right, as long as it was in power, did its best to maintain the standard of the army. Things have entirely changed since the advent of the Left. Every day since then has brought new symptoms of insubordination which remains unpunished. A despicable criminal who shot his officer in a cowardly way and then allowed an innocent comrade to be suspected, became a martyr of Republicanism. His name became the watchword of malcontents, and *Circoli Barsanti* sprang up everywhere like mushrooms. A captain of a frigate was put into *disponibilité* by the Minister of the Marine, because he sent a disobedient boy to the masthead, and the boy happened to fall into the sea and was drowned. Two non-commissioned officers, one of whom had pulled his major's mustachioes, whilst the other insulted his lieutenant before the ranks, were condemned to death by court-martial, and the King forced to pardon them. Thereupon the Minister of War tendered his resignation and was replaced by the present Minister, whose first act almost was to remove from the army one of the most hopeful young officers, a colonel at the age of forty, because he had at a military banquet offered a toast to the King and promised that whosoever should touch his person would have to do with the entire army! Besides, even if the army were strong enough to resist the demoralizing influence, where is the general who would have the devotion to lead it to a *coup d'état?*

There remains a parliamentary *coup d'état:* the King calling in a firm member of the Right and appealing to the country by general elections. This, of course, will be the end. But things are not yet gone far enough to give secure hope that such elections would return a compact moderate majority decided to support an energetic Ministry through thick and thin. There is, though, some hope, however slight, that things may improve in this sense without its being necessary that more horrid crimes like the Florentian one should be committed. It seems certain that Pope Leo XIII. has given the word to the Catholics to take part in the next election. If this should really come to pass, a great point would be gained. The presence of twenty Clericals in the House would at once efface the four or five shades of opinion, unite in a compact mass the four or five fractions which now occupy the Right, and the two Centres. If this were the case, a Government commanding a steady majority—which no Government could boast of since 1860—would be able to do in two or three years for the improvement of the country, the reform of justice and administration, more than has been done during the last nineteen years. If the country returns again a Parliament which represents nothing but local and personal interests split into dozens of groups, we may be sure that ere long we shall drift into a republic, which the nation is exceedingly afraid of, but which it will quietly submit to, having lacked the energy to prevent it.

Correspondence.

BAYARD TAYLOR'S NOVELS.

To the Editor of The Nation:

Sir: In the reference in your paper of last week to the literary work accomplished by the late Bayard Taylor the expression was used in connection with his novels and volumes of travel that they were "probably not now read." This statement does not do justice to the continued appreciation given by the public to these books, for it is the fact that they continue in steady demand both in England and the United States. Of the seventeen volumes of prose works, from the 'Views Afoot,' issued

over thirty years ago, to the 'Boys of Other Countries,' published in 1876, not one has been allowed to go out of print, and the sales still amount to some thousands of volumes yearly. Of the five volumes of fiction nearly 50,000 copies have been called for. Of the whole series, the book first written, the 'Views Afoot,' which describes the tramp across Europe of the author when an impecunious youngster of seventeen, continues to be the most popular.

Requesting the insertion of this correction, we are

Yours very truly, G. P. Putnam's Sons.

New York, Dec. 26, 1878.

[Our conjecture was confined to the novels alone.—Ed. Nation.]

FRANCE AND SILVER.

To the Editor of The Nation:

Sir: A few months ago the Chicago *Tribune*, which had been in favor of—or, at least, not opposed to—a restricted silver coinage, changed its mind and became a frantic advocate of removing all restrictions. Since then hardly a day has passed by during which it has not, either in its editorial columns or in its answers to correspondents, held up France as a shining example of a country reaping the benefits of a practically unlimited silver circulation. It has been and is asserting every day that in France there is in active use as a circulating medium the sum of 600,000,000 dollars of silver coin; that the French debtor fully enjoys the option of paying in the cheaper metal; and that the Bank of France can legally redeem its notes either in gold or in silver.

While I am not disposed to place implicit faith in the assertions of the *Tribune*, or to accept as sound the arguments which it predicates on them, you would still confer a favor on myself and many of my friends, and perhaps also the Western public at large, by placing before us the real condition of the silver problem as it exists in France: the amount and kinds of silver coin there in circulation; how it happens that it is on par with gold, although its bullion value is so much less; and by setting forth the similarity or dissimilarity, relative to the silver question, between the state of affairs in this country and in France.

Hoping that I am not asking too much, I am yours respectfully,

Philip Stein.

Chicago, Dec. 16, 1878.

[1. The estimates of silver circulating in France, as given by the Chicago *Tribune*, are quite too high. The latest and most authentic statement on the subject is that given by M. Léon Say, the French Finance Minister, to the International Monetary Conference, in August last. He stated the full legal-tender silver coin to amount to two and one-half milliards of francs, which is equal to $492,500,000. Of this there were in the Bank of France at the same date $189,500,000, leaving $303,000,000 in actual circulation.

2. The French debtor does enjoy the privilege of paying in silver five-franc pieces (the only full legal-tender silver) or in gold, at his option, as both are by law equally money of payment. The Bank of France has also the right to redeem its notes and to pay its depositors in legal-tender silver as well as in gold. These facts being admitted, the real question which our correspondent propounds is as to the correctness of the inferences drawn by the Chicago *Tribune* from them, so far as they bear on the silver problem in the United States. The actual situation of France and its allies of the Latin Union, in respect to their monetary system, and how they have reached that situation, is a story which has been so often told, in the course of the silver discussions of the last two years, that it may seem to many of our readers a needless repetition to reproduce it here. But it appears necessary to state the facts briefly again, in order to give a clear answer to our correspondent.

The Latin Union was formed by Belgium, France, Switzerland, and Italy, in December, 1865, for the purpose of assimilating their gold and silver coins, and especially to equalize the fineness of their divisional coins, and to provide for the indiscriminate circulation of all coins, both gold and silver, in the countries of the Union. The moving cause of the Conference which made the treaty was the excessive drain of silver to India, which had not only carried off a large part of full-weighted silver, but much of the token silver also. Silver was then of higher value in Europe than gold, the influence of the surfeit of Australian and Californian gold not having ceased to operate. Eight years afterwards the position of the two metals was completely reversed. Germany, early in 1873, began her new monetary reform, and determined to demonetize silver. Having been an exclusively silver country, this step on the part of Germany threatened to throw a great quantity of silver bullion upon the French and Belgian and Swiss markets. Switzerland first took the alarm, and invited a meeting of her Latin allies, which took place at Paris, in January, 1874. This Conference restricted the coinage of full-weighted silver for that year to $24,000,000. The allied Powers met again in January, 1875, and in January, 1876, and at each meeting restricted the joint coinage of the current year to the same sum of $24,000,000. Switzerland did not coin her full contingent of $1,450,000 in 1875, and France and Belgium suspended silver coinage altogether early in 1876. None of the allies coined silver in 1877 or 1878, unless it be Italy, as to which country we are not certain. By the new treaty, concluded on the 5th of November last, there is to be no further coinage of silver prior to January, 1886 (except a trifling sum of $5,000,000 by Italy), unless by common consent, and that is not likely to be obtained. Such has been the legislation affecting silver in the countries of the Latin Union.

France, being constantly a creditor country, commercially, since her suspension of specie payments in July, 1871, has received a steady inward flow of the precious metals. With a paper currency practically at par with gold till resumption in January, 1878, the tendency of coin to accumulate there was very great, and the Bank of France, therefore, found it an easy matter prior to resumption to store up $400,000,000 of gold and silver in her vaults, besides paying out more than $333,000,000 in 1877, in order to make the final act of resumption easy. When the vaults were opened on the 1st of January last the quantity of silver was found by the public to be much greater than had been expected. This was due to two causes: first, to the export to France of nearly the entire amount of Italian silver coinage, Italy being under a suspension of specie payments; and secondly, to a very large influx also from Belgium, the silver coin being carried into France in the payment of trade-balances, and the cheaper metal being naturally preferred in these payments. The Bank of France now finds itself embarrassed by this excess of silver, and has taken measures to call in all its notes under the denomination of 100 francs ($20) in order to force silver into circulation. This step has met with much hostility in Bordeaux and in the manufacturing cities of the North, where convenience of handling has caused the notes of small denominations to be preferred to coin. The substitution of paper money for specie during the seven years' suspension of specie payments, and the absence of all premium on gold for most of that time, have made bank-notes very popular among the trading classes of France; while the agricultural peasantry still prefer the heavy and tangible *écus* (five-franc pieces of silver). In spite of all efforts to prevent it, the French mono-metallists assert that silver has a constant tendency to gravitate towards the Bank of France. Such is the statement of M. Victor Bonnet in his recent papers on the subject. The anxiety of the French Government to continue the suspension of silver coinage, as manifested both in the International Monetary Conference of last August and the Conference of the Latin Union of November, indicates that such is the case. Both the Bank of France and the National Bank of Belgium have agreed since the last Conference, as they have voluntarily agreed after every previous monetary treaty, to receive at their counters such foreign coins, either of gold or silver, as the public treasuries of their respective countries shall continue to receive.

Why does not French silver depreciate when silver bullion is worth fifteen per cent. and more less than gold bullion? This is one of the questions put by our correspondent. We answer: because, within the territory of the allied states, it is legally the equivalent of gold, and because, as coinage is suspended in those states, there

can be no import of silver except as merchandise at its bullion price. The legal equivalency will probably maintain the actual equivalency so long as the balance of trade continues to attract the precious metals to France. If the tide should turn and France were to become a debtor country it is the gold and not the silver which would go out, because, though only equal to silver at home, it is worth much more than silver abroad. Again, the greater intrinsic value of gold would drive it out now if the currency were excessive in amount, and that is the danger which the Bank of France has tried to remove by calling in her small notes. The notes of the Bank of France are now a strictly representative currency—that is, covered by a nearly equal amount of gold and silver held in the vaults of the Bank. If this reserve should be allowed materially to decline, without withdrawing notes of equal amount, the domestic currency would be excessive, and gold, now the most valuable element of it, would be exported.

If individuals were now allowed to import silver into France and coin it into five-franc pieces at the Paris mint, they would make a great profit. So, too, would the French Government out of a like operation; but if neither can coin, then neither has a motive to import, and if there are no foreign debts, or, rather, no balance of aggregate indebtedness to pay abroad, there is no motive to export bullion. Being, therefore, stationary, and not subjected to the test of a necessary exchange against gold, the intrinsic inferiority of silver is only manifested by the growing disinclination of business men to take it, and by its consequent tendency to accumulate in the banks and public treasuries. The phenomenon thus explained is not new. Silver coin has maintained its purchasing power both in Belgium and in Holland, in spite of the great decline in the price of silver bullion, but it has been because both countries have suspended silver coinage, and are financially in a healthy condition.

Does the situation of France, as we have thus attempted to explain it, give any encouragement to the further coinage of silver in the United States? We think not. Though 16 to 1 is below the European ratio of 15½ to 1, still it is much above the commercial relation of silver to gold. If individuals were allowed to bring silver bullion to the mint and take back coin, they would be justly denounced as bonanza speculators. If the Government of the United States were allowed to do it, they would be guilty of making legal-tender money out of debased metal—an act of tyranny on the part of their rulers against which all nations have revolted. To make silver dollars out of a material intrinsically worth fifteen per cent. less than standard gold dollars, and to palm them off upon the people as the equivalent of gold dollars, would be just as reprehensible as if the Federal Government had added fifteen per cent. more of alloy to the silver dollar before silver bullion had fallen in value. If, like France and other silver-using nations of Europe, we now had a circulation of silver coin, honestly issued when its intrinsic value was equal to its legal value, we might honestly continue, as long as we could, to keep such coin in circulation at its legal rate. And if, on the other hand, we could agree to resume unrestricted coinage with so many other nations using silver as to give a reasonable hope that by that act silver would soon recover its normal value of 61*d.* per ounce, we might be justified in so doing. But to go on coining depreciated silver, with the certainty that such a course will draw silver to this country until all our gold is expelled, is simply to take upon ourselves the unnecessary and utterly indefensible hardship of a great loss, which we alone among nations have now the privilege of escaping.—Ed. Nation.]

THE YORK AND ANTWERP RULES OF GENERAL AVERAGE.

To the Editor of The Nation:

Sir: At the October meeting of our Chamber of Commerce the question of concurrence with the so-called York and Antwerp rules of General Average was brought up and referred to a special committee, which reported to the regular meeting held December 5. The deliberations of the committee having resulted in a majority report opposing the adoption of the rules and proposing reference of the matter to Congress for legislative action, and in a minority report recommending concurrence with the rules and their adoption so soon as it should appear that they had been generally adopted in Europe, the subject was laid over for consideration at a special meeting to be held on the 19th inst. At this meeting the majority report was, after an animated discussion, adopted by a vote of 18 to 15, and the question was thus decided in the negative.

Such a disposition of a long-mooted and important question must appear surprising to those who remember that the Chamber had on three different occasions (last in the summer of 1877) sent delegates to the International Conferences held in Europe mainly for the purpose of harmonizing the existing laws and practices relating to general average, and that the Chamber had thereby signified its appreciation of the importance and desirability of that object, and its readiness to join other commercial nations in the settlement of disputed questions on the principle of "give and take." Our surprise at such a decision is, however, heightened when we come to examine the arguments advanced in the majority report, and more particularly the statements made in its support at the two last meetings of the Chamber, by which I cannot but think many of its members have been unwittingly misled into conclusions both erroneous in themselves and conflicting with the sentiments which their body has deliberately expressed on several previous occasions.

It would trespass too much on your space if I were to enter into the merits of these rules in detail, but I feel sure that a mere general review of the report and of the discussion had will show that the chairman of the committee represented the matter to the meetings in an entirely one-sided way, and in a manner calculated to bring about the hasty and ill-considered action which I deprecate.

In their report and statements no reference whatever has been made by the majority of the committee to any previous action of the Chamber in the premises, or to the valuable reports made by their delegates to the International Conferences; the subject is throughout treated as if the question of harmonizing the practices and laws governing general average was for the first time brought before the Chamber, and as if we were threatened unawares with having forced upon us rules in the making of which we had had no hand or voice; whereas those reports and the rules themselves show that our delegates had brought the justice and propriety of sundry American rules very successfully to bear on the intelligence of the conferences. The fact that eighteen years of agitation and deliberation were required for framing the twelve rules to the satisfaction of the great majority of the last conference was turned into a slur on the earnestness and capacity of the parties engaged in that work, whereas but a superficial survey of the prolonged and thorough discussions which had been going on at those conferences and in their standing committees, and of the copious literature brought out by these discussions, must impress every unprejudiced mind with the magnitude of the obstacles that had to be overcome, and with the fact that these rules have not been framed without the closest consideration of their character and of their bearing in all directions. National feeling and prejudice have been invoked by the statement that it was mainly a proposal in favor of British ship-owners that was to be met, whereas but a cursory review of the history of the movement shows that it was by the pressure of the Continental interest, of parties situated largely as we are, that the result of these conferences, which is now before us, has been obtained. The Chamber was coolly told that uniformity might be a good thing, but not in all cases, thus trying to convey the impression that the previous action of the Chamber had been purely sentimental, and that in consequence of such weakness we were now on the point of being led into a trap, from which danger we could be rescued only by the stout assertion of our superior wisdom. By artfully avoiding any allusion to benefits that would accrue to our ship-owners by the adoption of these rules, one or two points of secondary importance wherein they restrict our present practice were dwelt upon with a vehemence of assertion which, to those not entirely familiar with the questions, was calculated to make them appear as of prime importance, and in this way American ship-owners were led to believe that their interests would be injuriously affected by the rules, whereas in Europe ship-owners find more than compensation for all that may so affect them, in the adoption of Rules 7 and 8, which secure them allowance for wages and provisions and other expenses incurred while in a port of refuge, which compensation is now denied to them in all ports under British and French jurisdiction.

Very little reference was made to the fact that of the twelve rules eight virtually conform to our practice, three only modify it slightly, and only one rule seems to change it. This rule (5) was treated as if it totally exempted cases of voluntary stranding from general average, whereas it merely exempts cases where the qualification of stranding

as "voluntary" is obviously inapplicable. I will grant that weighty arguments can be made on both sides of the question of voluntary stranding, but I maintain that the American rule will not be strengthened by misrepresentation and by ignoring the fact that the restriction contained in Rule 5 received the unanimous sanction of the Antwerp Conference, including the delegates from many Continental countries whose present practice agrees more or less with that of our country. With the view of discrediting the rules, it was urged that they were got up for the exclusive benefit of underwriters. Although they are opposed by the chairman of the committee, himself an underwriter, and by the largest underwriting association in the world, the managers of the London Lloyds, who would prefer to have general average abolished altogether, this fact may be admitted, but not the conclusion, which the majority of the committee would seem to suggest as a necessary consequence—viz., that such benefit must result in a corresponding injury to the insured. Shipowners and owners of cargo can and do generally cover all their risks by insurance, and are, therefore, but little affected by the rules of general average. What these rules are calculated to effect is not justice between insurers and insured, but justice between insurers of vessels and freights and insurers of cargo, and it seems to me puerile, in these times of highly-developed international trade, to contend that the commerce of any nation can be benefited by keeping its insurers tied down to a diversity of rules, which prevents their knowing the risks they insure and causes continual disputes and expenses, that must necessarily tend to increase the rate of premium.

The difficulty of introducing the rules, also, had to be magnified beyond all reason, and by pointing to Congressional legislation the majority report not only provokes a smile, but it impugns the assertion of the value of judicial ruling so emphatically made by its chairman, and proposes a total abandonment of what has hitherto governed our course. Much also was made of the fact that there remain many disputed questions, arising in general-average cases, which these rules do not settle, and the chairman went so far as to assert that their adoption would result in a total abrogation of our own rules in the settlement of such disputed points. Such a statement, in my humble opinion, proves nothing but the spirit of exaggeration which pervaded his arguments. That there remain unsettled points no one does deny; but I may refer to the report of our own delegate to the Antwerp Conference for an explanation why some important questions of the kind have not been settled. The fertile brain of an average-adjuster may multiply the number of such points beyond the hundred that were mentioned, but I think I am safe in asserting that but very few of any importance are not embraced in the twelve rules now under consideration. Nor could we derive from their number or their importance, were these ever so great, any valid reason why those rules on which a sentiment approaching to unanimity has been secured should not be introduced into the common practice of the commercial world. This may not inure to the benefit of average-adjusters, who may be supposed to thrive on disputes and uncertainties, and who might have suggested to the majority of the committee one valid argument against our adopting the rules, which the modesty of the chairman, I suppose, has led him to suppress. The boldness and self-sufficiency with which in all other respects the arguments of the majority report were supported, and the consequent fear of being drawn into a personal dispute, no doubt prevented the framer of the minority report from changing the moderate and self-possessed tone of his arguments; but it is to be regretted that none of the other members of the Chamber present felt called upon to show up at least the discreditable method by which the majority report was defended, and that none of our late delegates to the International Conferences, who are not members of the Chamber, had been invited to take part in these discussions.

In conclusion, I believe the Chamber has been misled into a position from which it will sooner or later have to recede, and for its own credit I hope that the whole question will be reconsidered at an early day.

GUSTAV SCHWAB.

NEW YORK, Dec. 28, 1878.

Notes.

WE have received from Mr. F. Gutekunst, Philadelphia, an admirable and striking photographic likeness of the late Bayard Taylor, as he would have liked to be and will be remembered by his friends.——Mr. E. Steiger sends us his 'Educational Directory' for 1878, which may be briefly described as a semi-annual reprint, with corrections and additions, of two important departments of his 'Year-Book of Education,' viz., the list of educational institutions in this country, the British Dominions, Germany, and Austria; and the elaborate catalogue of publications on education and general philology. The information contained in these and in the publishers' advertisements bound up with them should prove of great value to parents, teachers, and students.——From Mr. F. W. Christern come two more parts of the 'Dictionnaire de Pédagogie,' the scope of which we described in our issue of October 3 (No. 692). In the so-called theoretic portion the most noticeable articles are *Bible*—discussions of its place in public instruction from the Catholic, Protestant, and Hebrew points of view; and *Bibliographie*—the first attempt ever made to catalogue all French publications relating to education from the fifteenth century to the present date. The arrangement is by years, and then alphabetically, and an alphabetical index concludes this important undertaking, which occupies fifty-eight pages. In the practical portion teachers will be most interested in the article *Brevet de capacité*, a comparative collection of examination papers for the teacher's diploma in France and the leading foreign countries, the United States not excepted. These occupy forty-six pages.——Mr. S. B. Noyes has now issued Part II. of his excellent 'Catalogue of the Brooklyn Library,' with whose merits our readers are already familiar. The volume begins with *Cumberland's British Theatre*, whose contents are displayed in full, and ends with *Mythology*, one of the numerous "classes" in which this Catalogue abounds. The profusion of cross-references is remarkable, and so is their laborious minuteness.——A welcome announcement is made by Claxton, Remsen & Haffelfinger of a translation of Legouvé's 'Art of Reading,' by Edward Roth, with biographical notes and a portrait of the author. The volume will appear this month.——The second volume of the *Magazine of American History* (A. S. Barnes & Co.) is prosperously plump, having nearly eight hundred pages. The illustrations count up when thus bound together, and the index reveals the fulness of topics which give life to this valuable periodical.——*Littell's Living Age* begins with the number of January 4 its 140th volume.——The *Literary World* (Boston) announces for the coming year a series of "Short Studies of American Authors," by Mr. T. W. Higginson.——Architects, landlords, and tenants, to mention no others, should find their account in more or less constant acquaintance with the contents of the monthly *Plumber and Sanitary Engineer*, edited in this city by Mr. C. F. Wingate. The first number of the second volume shows a marked improvement in external appearance and in its contents, besides enlargement. Articles on the electric light, by Prof. Henry Morton; on water supply for small towns, by Mr. E. S. Philbrick, and on the sanitary condition of tenement houses, by Col. Waring, are some of the attractions of this number.——From the *Academy* we take the following English announcements: 'Notes of a Naturalist on board the *Challenger*,' by H. N. Moseley; 'The Afghan War of 1838-42,' from the journals and papers of the late Maj.-Gen. Augustus Abbott; Müller's 'Life of Moltke,' edited by Capt. Hozier; 'Julius Cæsar,' a sketch, by J. A. Froude; and 'Memorials of the Civil War in Hertfordshire and the Adjacent Counties,' by the late Rev. John Webb.——In No. 667 of the *Nation* we paid tribute to the rare learning and authority of Kiepert's 'Lehrbuch der alten Geographie.' The second half of this important work, devoted to Europe alone, completes it, and is accompanied by preface, title-page, and index as promised (Berlin: Dietrich Reimer; New York: L. W. Schmidt). Dr. Kiepert announces that he has in an advanced state a 'Student's Guide,' containing only the most essential facts and the correct spelling of proper names. He also freely gives his and his publishers' consent to a translation of the work into any language, and offers to assist with corrections and improvements.——The first number of the *Deutsche Rundschau für Geographie und Statistik* has just appeared. It is edited by Prof. Carl Arendts, of Munich, and published by Hartleben, of Vienna.——At the end of September there were published in Germany 47 socialist journals, of which 12 were dailies, printing altogether 110,000 copies. The *Hamburg-Altonaer Volksblatt* heads the list with an edition of 16,000, followed by the *Berliner Freie Presse* with 12,000. There are not included in this number many other journals having socialist tendencies.——The fifth *Lieferung* of Von Holtzendorff's 'Handbuch des Deutschen Strafprozessrechts' (Berlin: Carl Habel) relates to the modes of procedure for seizure, search, and arrest for the securing of proof.——A novel, 'Vroni,' by Baron Ferdinand von Rothschild is announced in Germany.——The *Magazin für die Literatur des Auslandes* is our authority for the statement that G. Valbert, well known to the readers of the *Revue des Deux Mondes* for his frequent and brilliant articles on political and social matters in Germany, is M. Victor Cherbuliez in disguise.——The publication of La Curne de Sainte-Palaye's great work, "Dictionnaire

historique de l'ancien langage françois, ou Glossaire de la langue françoise depuis son origine jusqu'au siècle de Louis XIV." has reached the fifth volume. It includes the words *Décéder—Eschouement.*——One of the secretaries of the Chinese embassy at London has undertaken to translate Shakspere into Chinese.

—Mr. S. A. Schoff has engraved in line, and published at Messrs. Doll & Richards's, in Boston, the portrait of Emerson by Rowse which was executed some years ago and is in the possession of Professor Charles E. Norton, of Cambridge. The portrait is in crayon and is one of Mr. Rowse's most admirable works. It is a remarkable likeness, and happily renders the sweetness and serenity of expression which are characteristic of Mr. Emerson. Mr. Schoff's engraving reproduces all the essential qualities of expression and treatment in the original with surprising fidelity. It is a sympathetic, and not a merely mechanical, piece of work ; and it evinces a power of drawing, and a feeling for subtle qualities of form and light and shade, which are most rare among modern engravers. The quality of the well-defined yet softly-melting edge in the contours of the face seems really wonderful, and the sureness and economy of line and touch by which the total result is reached entitle the work to rank among very uncommon achievements. It is to be regretted that so fine a work as the original is marred by so great a degree of incorrectness in the rendering of subordinate parts. The shirt, the cravat, the coat, and the waistcoat are not to be found fault with because they are slight and sketchy, but it is a considerable minor objection to the work that they are rendered in so slovenly and false a manner. The engraver has, however, done as much as possible to abate these defects.

—The *North American* will hereafter appear monthly ; but in spite of this sign of enterprise and apparent success, it is to be regretted that the *Review* has lost its character as a mainly literary periodical. The January number contains only one article having any claim to real literary value, Mr. Story's "Pronunciation of the Latin Language"; for the review of five recent novels, by Mr. Richard Grant White, is not to be so classed, and the "Unpublished Fragments of the Little Period" of Thomas Moore is not in itself valuable, and has no introduction or comment or editing of any sort. In political matters Senator Edmunds gives a clear, brief statement of the "Fishery Award," such as he might have written as private notes for his own use. Mr. Henry Watterson writes of "The Solid South" from the Southern stand-point vehemently and with journalistic partisanship, and Mr. Boutwell in "Substance and Shadow in Finance" restates elementary principles of political economy for popular instruction. The most valuable and suggestive article is by Mr. Wm. R. Martin upon "Cities as Units in our Polity," in which he discusses the condition of New York particularly, points out that retrenchment by itself will not furnish sufficient relief for the burdens of our indebtedness, and insists on the necessity and propriety of increasing the revenues by utilizing unemployed sources, such as taxes on the use of the streets and other public property by corporations, and a system of duties on food resembling the *octroi* duties in Paris. The other articles are "The Cruise of the *Florence*," by Captain Howgate, and "The Preservation of Forests," by Mr. F. L. Oswald, which is full of information.

—The "Banker's Daughter," now on the boards at the Union Square, has given rise to some dispute on the question of authorship, two or three different unknown dramatic writers having entered the lists against Mr. Bronson Howard, the reputed author. Judging by internal evidence, it will prove a matter very difficult to settle to the satisfaction of the claimants, as the play might have been written by almost anybody, or even turned out by machinery. It belongs to a family of plays which are always more or less successful in New York, of which "Divorce," "Saratoga," and "Pique" are representatives, and of which the most marked trait is that they are constructed upon a French model and adapted to the United States by changes of character and scene of a most simple description. The "Banker's Daughter" is a trifle more American than most plays of its class, yet if it does not turn out, at some remove, to have a French origin, we shall be greatly surprised. The story is that of a young and beautiful American girl, engaged to be married, who breaks her engagement and marries a wealthy suitor, in order to save her father from ruin. She imagines that her husband thoroughly understands the circumstances; but in this she has been deceived by her father. The husband knows nothing. The marriage turns out well enough, but there is always a sad look in the eyes of the banker's daughter, which everybody sees but her husband. Of course this is caused by the painful separation from the only man she ever really loved, and of course he turns up in the course of time and learns all. A heartrending scene takes place, after which a French gentleman of noble family but low character, the *Count de Carojac*, provokes the American, *Mr. Harold Routledge*, to a duel (what would a play of this sort be without a duel?), in reality about *Mrs. Strebelow*, but nominally about the American flag, which, in order to make an excuse for a meeting, the Count kindly insults. They fight in dead earnest, and *Harold* falls mortally wounded. On his body being brought into the presence of the banker's daughter a terrible *éclaircissement* takes place, in which all is made known to the unhappy husband. However, as the lover subsequently dies, there is nothing for it, in the fifth act, but a reconciliation (if there can be a reconciliation where there has been no quarrel) between husband and wife. This is effected through the medium of their daughter, who restores complete harmony. This somewhat trite and flat plot is relieved by the humor of *Mr. G. Washington Phipps*, an American tourist (the scene is laid in Paris), who, as represented by Mr. Polk, is very amusing. The young wife of the decrepit *Brown*, Miss Maude Harrison, is also very good. Miss Jewett, as the banker's daughter, acts her part with taste and intelligence, but without anything more.

—In the September number of the Journal of the Statistical Society of London there is a remarkable paper by Cornelius Walford on "The Famines of the World, Past and Present." It commences with a table giving in chronological order all the famines of which there is a record, amounting to over 350, from the Egyptian famine mentioned in the Bible to those which have prevailed in Cashmere and Morocco during the present year. The famines in China, with the exception of that of 1877, are omitted for want of any available details. When it is possible, there is given besides the bare fact a brief account of the famine, together with its assigned cause. It is interesting to note from this list that famines gave rise to the Corn Laws in England in 1258, when the citizens of London were forbidden by proclamation to deal in foreign grain, and to the Poor Law in 1586. The causes are divided by Mr. Walford into twelve different classes : the natural—rain, frost, drought, meteorological phenomena, as earthquakes, and insects or vermin ; the artificial—war, defective agriculture, defective transport, legislative interference, currency restrictions (including debasing the coin), speculation, and the misapplication of grain as in brewing. The five natural causes he examines first, giving chronological lists of the great floods, frosts, drought, cyclones and earthquakes, and the plagues of insects. These tables are of great length, with the exception of the last, filling fifty pages of the Journal, and showing immense research on the part of the author. Following these is a still more remarkable table, fifteen pages long, of the "Literature of Earthquakes, Comets, Storms, etc.," commencing with a work of Aristotle, republished in Paris in 1493, under the title "De inundatione Nili." A noteworthy fact, as shown by this bibliography, is the small number of works written in this century compared with those of the seventeenth and eighteenth centuries. The earthquake of 1580 gave rise to nine works published in London, whilst thirty-four are recorded for 1756, the year after the Lisbon earthquake. When the tables of the famines are compared with those of the floods, frosts, etc., Mr. Walford frankly expresses his disappointment that they do not coincide, and that the effect does not seem to follow the cause. Nor is he able at present to explain this failure. The latter part of the paper is devoted to an examination of the sun-spot theory with reference to Indian famines. The "artificial causes" of famines will be treated in a second paper. In his testimony before the Committee of the Society of Arts on the feasibility of a universal catalogue of printed books, Mr. Walford stated that he had in his private library "some 30,000 volumes, tracts, and pieces."

—Justus Perthes announces that *Petermann's Mittheilungen* will continue to appear under the same name, in spite of the decease of its founder, and that Dr. Ernst Behm, the associate editor since 1876, and Dr. Moritz Lindeman, hitherto Secretary of the Bremen Geographical Society, and publisher of the *Deutsche Geographische Blätter*, will be the new conductors of this periodical. Bruno Hassenstein, the oldest pupil of Dr. Petermann, will superintend its cartography. A number of interesting papers and valuable maps are promised for the ensuing year. Along with this announcement we receive a map from the *Mittheilungen*, showing on a small scale, but very clearly, Afghanistan, Beluchistan, and the neighboring countries, and on a larger scale the Khybar Pass. B. Westermann & Co. send us a similar map, of about the same scale, but more extensive, by F. Handtke, to which is annexed a map of the Indo-Afghan border, with plenty of space for details. In size surpassing all of these, but less distinct and rather confusingly colored, is Kiepert's Iran (eastern half), published by Dietrich Reimer. Not so open to objection, yet of like character, is Kiepert's special map of the country between

Cabul and the Indus (Reimer). All these maps will have their uses with students of the new Eastern Question, and all together illustrate the glorious indefiniteness of Asiatic boundaries and the glorious uncertainty of Eastern orthography.

—Among recent musical publications and announcements the following are of importance: Breitkopf & Härtel have issued vol. i. of Pohl's 'Biography of Haydn,' and a new edition of Liszt's 'Chopin.' A new edition, the fifth, of Brendel's 'History of Music' is being issued in monthly parts, with additions. This is the best history of music from the liberal or advanced point of view. Novello, Ewer & Co. have added to their excellent series of music-primers 'Instrumentation,' by Ebenezer Prout, 'Fugue,' by James Higgs, and 'Musical Forms,' by Ernst Pauer, all of which deserve the attention of musical students. J. Engelhorn has just issued 'Die Tonkunst,' a treatise on musical æsthetics, by H. A. Köstlin. In Carl Eschmann's 'Hundert Aphorismen' (Berlin: Leuckardt) pianists will find some valuable hints, and other matter of interest. A second Symphony, Op. 55, and a Messe de Requiem, Op. 54, by Saint-Saëns, have been printed in Paris by Durand. Kahnt, in Leipzig, announces Palestrina's Stabat Mater, motette for two choruses *a capella*, edited for performance in churches and concert halls, by Richard Wagner. The German musical papers complain that there is so little demand for Breitkopf & Härtel's complete edition of the works of Mozart, the number of subscribers not having yet reached a hundred. While London furnishes twelve and Paris nine subscribers, Vienna has only one, and Leipzig, Stuttgart, Breslau, and Königsberg do not figure at all on the list. About 40,000 marks have already been collected for the projected performances of Wagner's "Parsifal" at Bayreuth. All those who now join one of the numerous Wagner societies and make an annual payment of fifteen marks are entitled to seats for the first performance, and also receive copies of the *Bayreuther Blätter*, to which Wagner himself contributes articles. Some thirty years ago Wagner conceived the plan of writing a music-drama on Jesus of Nazareth, but he soon saw that the plan was impracticable. The motives and ideas collected for this project are now as far as possible being utilized in "Parsifal," which affords no difficulty, on account of the affinity of the subjects. Rubinstein is at work on a new opera, and Liszt on a new oratorio. Herr Abert's opera, "Ekkehard," was not a success at Berlin. The house remained empty after the second performance. "Armin," a new heroic opera, text by Felix Dahn, and music by Heinrich Hoffmann, has been much more favorably received and is sure to make the circuit of the German opera-houses. Almost simultaneously with the performance of "Armin," at Berlin, the same composer's "Aennchen von Tharau" was for the first time produced at Hamburg, also with great success. Hoffmann is by many regarded as the coming man on the operatic stage. His operas, like most recent works of the kind, show a decided leaning toward the modern theory of the music-drama. The extraordinary announcement is made that the celebrated cathedral choir of Berlin intends to make a tour in Italy next season, giving concerts in various churches and conservatory halls. What a change this implies from the time when all vocalists were derived from Italy, and when Frederic the Great could say that he would rather listen to the neighing of his horse than to the singing of a German prima donna! It is doubtful whether even in the classical age of song a chorus ever existed superior to the wonderful cathedral choir. It gives the impression of a simple quartette endowed with the dynamic qualities of a large chorus, such is its purity of tone, smoothness of modulation and delicacy of shading. Even the Berlin Singacademie appears coarse and unpolished in comparison. It seems strange that it should never have occurred to some enterprising manager to engage the cathedral choir for a concert tour through America. Such a tour could not fail to prove a financial success; and while giving American audiences a new sense of the infinite beauty of choral music, it would induce half of our musical societies to give up the ghost in despair, while the others would return to their work with new energy and ambition.

TYLER'S AMERICAN LITERATURE.*

IT gives a sense of increasing solidity and maturity in our literature when a book so strong and comprehensive as this—representing such thorough work both in preparation and execution—is born, as it were, full-grown, without previous heralding or discussion. A similar impression was made a few years since when Mr. Hubert Bancroft came modestly from San Francisco to New York bearing the first volume of his great work on the 'Native Races of the Pacific.' The interest is enhanced by the fact that both these authors worked at a distance from large public libraries and the chief publishing cities; and this predicts the vast literary result that may one day be achieved in America, when the outposts shall have ceased to be outposts and the foci of intellectual labor shall be distributed over the whole continent.

Professor Tyler's work does not treat, like Mr. Bancroft's, of buried cities and undeciphered inscriptions, but of buried years and unread books. As it was long the custom among European scholars to dismiss the whole period of the Middle Ages as an epoch of darkness not worth the exploring, so it has become almost traditional in this country to ignore the whole literary product of the soil before the days of Irving and Cooper. Mr. Underwood's hand-book of American literature is the best book of its kind yet produced; but in his preface he sets aside the whole seventeenth century with, "Our early literature is interesting only to antiquarians and students of church history" (p. xi.) It is in the light of such verdicts as this that Professor Tyler's work is to be read. If he has proved the literature thus contemptuously dismissed to be in reality rich in thought or descriptive power, full of vivacity, and often delightful in expression; if he has gone through the seventeenth and eighteenth centuries of American literature and made of them a book more interesting than half the new novels, he has accomplished far more than if he had unearthed a whole new city in Yucatan or had corrected the boldest of Brasseur de Bourbourg's extremely conjectural interpretations. This is precisely what our author has done. His two volumes are not only carefully prepared, beautifully printed, and so accurate typographically that we have not yet detected a misprint, but they are readable and attractive from beginning to end. The writer does not shirk the theologic problems—he handles Jonathan Edwards like a lover—but there is a predominant literary feeling throughout the book. His quotations are very abundant, but they always tell; he has not been a professor of English literature and adapted himself to the undergraduate mind for nothing. One can see that through all his antiquarian labors and all his reading of forgotten folios he still held firmly to one clear end—to make his book attractive; and he has succeeded.

These two volumes form only the commencement of an extended work on American literature, so far beyond all predecessors in its conception that it really stands alone. Of the portion here printed, one volume extends from 1607 to 1676, and the other from 1677 to 1765, the year of the "Stamp Act" and the proper boundary of the ante-revolutionary period. The first volume may be said to deal in general with the epoch of discovery and settlement, and the second with that of religious discussion and social development. It costs the author comparatively little skill to make the first period interesting. To begin with, he has the treasure-house of Captain John Smith upon which to draw—a hero who really ranks with Robinson Crusoe in the heart of every school-boy; who rouses a natural indignation in the breast of every Dryasdust by his evident inaccuracy and vain-gloriousness, but who makes himself delightful, in spite of everything, to every lover of good literature by the inexhaustible vigor, the freshness, and the copiousness of his literary work. Professor Tyler well characterizes his style as "racy, terse, fearless; . . . Hotspur rhetoric, jerking with impatience, truculence, and noble wrath" (i. 29). And besides Smith our author depicts for us others of the early Virginian writers: William Strachey, whose description of the "still-vex'd Bermoothes" is believed to have suggested Shakspere's "Tempest"; John Pory, who affirmed that among the "crystal rivers and odoriferous woods" of the New World he had "escaped much expense, envy, contempt, vanity and vexation of mind"; and George Sandys, who rescued leisure from Indian wars and massacres to complete the translation of Ovid which Dryden praised.

Then passing to the New England colonies, Professor Tyler finds ample material for quotation from the racy narratives of Bradford and Winslow in the Plymouth Colony, and Winthrop, Higginson, Wood, and Josselyn in the Massachusetts. The material is not merely rich in substance but in form; these men were not rude pioneers, but they were the flower of the English universities, and brought with them a trained habit of expression which at once took a new force and directness from the stern realities of their lives. They also brought with them a geniality of spirit which defied Puritan limitations, though it temporarily diminished under the controversial necessities of a later time; and their writings need no literary manipulation to make them racy and delightful reading to-day. Professor Tyler had only to exhibit them, nothing more

* 'A History of American Literature. By Moses Coit Tyler, Professor of English Literature in the University of Michigan.' Vol. I., II. New York: G. P. Putnam's Sons.

was needful. Had we a complaint to make it would be only of his omissions; as, for instance, of that wonderfully graphic narrative of a shipwreck given by Anthony Thacher in 1635, and preserved by Young in his 'Chronicles of Massachusetts.' Professor Tyler quotes a sentence from this (i. 102), but he should have given us much more. Charles Reade's shipwrecks and Bret Harte's snow-storms appear thin and melodramatic beside the living vigor of this narrative of plain fact.

We undoubtedly miss, in the earliest Puritan writers, that direct flavor of classical literature which we should expect from university men; and it is a remarkable fact that in the best preserved Puritan libraries, as the Prince Library in Boston, we find almost nothing of Greek or Latin poetry. But we must remember that the same peculiarity marked at that period the English universities from which these men came. At Cambridge, especially, the patristic literature was read far more than the classic; and we have the testimony of Barrow that, when appointed Greek professor in 1660, he tried in vain to interest the students in the Greek drama, and was compelled to fall back on Aristotle. In both England and America scholars then used Latin and Greek mainly for theological and metaphysical training. Professor Tyler strains the facts rather hard when he says that "even in these wild regions of the earth the accents of Homer, of Thucydides, of Cicero were made familiar to us from the beginning"; and that "a consciousness of the æsthetic principle in verbal expression was kept alive here, and developed by constant and ardent study of the supreme masters of literary form" (ii. 309). Thucydides and "Tully," if you please, but there is small trace of the study of any Greek poet. Greek and Latin stood then on essentially the same grounds with Hebrew, Chaldee, and Syriac, all of which were taught, from the beginning, at Harvard College. At that institution the sole requisite for the Bachelor's degree, in 1642, was that a student should be "able to read the Originalls of the Old and New Testament in to the Latine tongue, and to resolve them logically." The "æsthetic principle" would have been regarded almost as an offence, had it been acknowledged; nevertheless Professor Tyler is quite right in thinking that it must have exerted some silent influence through the classic tongues, whatever the professed aim of their study.

But the greater the concentration of the Puritan mind on metaphysical theology, the greater the dignity of the sermon and the sermonizer. A discourse from the pulpit was lecture and concordance, debate and commentary, all in one; while the grim wit of the time and the vivid personifying of all good and evil powers brought the performance dangerously near to the tragic sock and buskin. We know from the first manuscript sketch of 'Paradise Lost,' preserved in Milton's handwriting at Trinity College, Cambridge, that the great epic was originally planned as a sort of play, in which such sublime *dramatis personæ* as "the Morning-Starre" were to have a voice. That mighty drama still exists by implication in the poem; and it equally furnished the plot and performers for every Puritan discourse. The sermon was the weekly public performance of an inexhaustible tragedy, in which Satan, like *Hamlet's* father's ghost, was always muttering his part from beneath the boards. Professor Tyler does well, therefore, to treat the Puritan sermon as a part of literature—read in public, as were the histories of Herodotus, and commanding far more than these the rapt attention of the people. Indeed, the preachers themselves found their own attention pretty thoroughly absorbed, if we may trust the assertion in Samuel Sewall's diary that he himself in his youth had preached, on one occasion, for two hours and a half without looking at the hour-glass. Humanity would forbid Mr. Tyler to reprint the whole of discourses so vast in structure; but he selects many an admirable reproof, many an eloquent aspiration, from the recorded sermons of that period. Nor are the themes of these ringing sentences at all monotonous, since they cover many of the most familiar aspects of the Puritan life: thunder, hail, drought, house-building, periwigs, embroidered sleeves, loss of cattle by cold, and frowns of Providence. The compiler makes an admirable selection or *florilegium* of the whole pulpit eloquence of that period; and if he does not give extracts from the yet weightier and more long-winded prayers that accompanied the sermons, it is because no *Herald* reporter had yet undertaken their preservation.

And if Professor Tyler makes so much of these resources, we can imagine with what zest he draws upon the directly controversial literature of that time, whether in dealing with the racy "secular" wit of the "Simple Cobbler of Agawam," or with that vocabulary of spiritual warfare which Roger Williams gently denominated "sharp Scripture language." It is worth while to dwell especially upon this last quarry of eloquent invective, because Professor Tyler's view of Roger Williams is the only instance in which he swerves—to our thinking—from the judicial habit of mind which usually marks his book. It is too late for either friend or foe to alter very greatly the position now occupied in history by the founder of Rhode Island. With all his noble virtues and services, his fame will never obliterate that description of him given in the letter of his friend and defender, Sir William Martin, to Governor Winthrop (in 1636), as "passionate and precipitate"; or that exceedingly pithy characterization of him by John Quincy Adams as "a conscientious, contentious man." It is hard to say whether in his youth he made himself more obnoxious by his virtues or by his faults; and nothing could more thoroughly have achieved poetical justice in regard to his biography than when, in his old age, he confessed himself so worn out with the Quakers as to declare that in their case, at least, "due and moderate restraint and punishing" were not persecution, but "a duty and command of God unto all mankind" ('George Fox Digged out of his Burrowes,' p. 200).

But the plan of Professor Tyler's book is so vast and its execution so fearless that no reader can expect or wish to agree with all its personal judgments. It is a book truly admirable both in design and in general execution; the learning is great, the treatment wise, the style fresh and vigorous. Here and there occurs a phrase which a severer revision would perhaps exclude, but all such criticisms are trivial in view of so signal a success. Like Parkman, Professor Tyler may almost be said to have created, not merely his volumes, but their theme. Like Parkman, at any rate, he has taken a whole department of human history, rescued it from oblivion, and made it henceforward a matter of deep interest to every thinking mind.

THE RACES OF EUROPEAN TURKEY.*

AMONG books which owe their origin not to a lasting devotion to a special branch of study, but to the laudable desire of satisfying a legitimate, momentarily quickened curiosity of the public, Mr. Clark's work deserves to occupy a high place. Both ethnographically and historically it embraces a vast field, and, within a certain scope, not unsuccessfully endeavors to do it justice in all its parts. It contains not only a large amount of matter which will be surprisingly new and curious to the average American reader—enough to make him wonder at the extent of what educated people ought to know, but generally do not—but also a great deal that will be read with pleasure and found instructive by those familiar with the principal works on the Balkan Peninsula and its history. The author, it is true, is himself totally unfamiliar with some of the best writers on the various topics of his enquiry, having only English books, including a few translations, before him. He is apparently ignorant alike of all the Slavic tongues, of Rumanian, modern Greek, and Turkish; and seems never to have trodden an inch of the ground which his descriptions embrace. But he has made good use of the sources of information accessible to him, such as the works of Gibbon, Leake, Finlay, Gordon, Tennent, Urquhart, Wilkinson, Creasy, Felton, Senior, and Paton: and the varied combination of sketches and extracts which he presents to us reflects equal credit on his selection of guides and themes, on his diligence in research, and care in elaboration. He copies, perhaps, too closely, but generally things worth copying. His main foible is an excess of enthusiasm, coupled with an optimism much more amiable than conducive to sound criticism and appreciation. If he speaks harshly or paints black—and there can be no lack of dark pictures in pages devoted to Byzantine imperialism and Christianity, to Turkish conquest and sway, to Slavic invasions and *rayah* insurrections—it is the past which he condemns or depicts; the present is covered with a rosy haze, and the future is shown approaching bright and serene.

The visions and reflections which are apt to strike the reader of the work are these: The day has dawned which is to open for the Christian populations of the former Turkey in Europe an era of freedom, enlightenment, prosperity, and greatness. The yoke of the Ottoman is broken, Russia and Austria contemplate only the good of the provinces they occupy or shield, and the delivered races are going to vie with each other in the fields of industry, education, and benevolent legislation. There are no fairer regions on earth than those watered by the Peneus and the Strymon, the Maritza and the Yantra, the Morava and the Danube. Why should not peace dwell and culture flourish in the valleys of the Pindus, the Rhodope, the Balkans, and the Dinaric Alps? All that is needed is

* 'The Races of European Turkey. Their History, Condition, and Prospects. In three parts. Part I. The Byzantine Empire. Part II. The Modern Greeks and Albanians. Part III. The Turkish Slavonians, the Wallachians, and the Gypsies. By Edson L. Clark, member of the American Oriental Society; author of 'The Arabs and the Turks.'' New York: Dodd, Mead & Co. 1878.

a firm determination to turn the scimitar, the hanjar, and the pike into plough-shares and to love one's neighbor. Let the Turk withdraw or die, quietly; let the Arnaut, the Miridite, the Uskok reform; let the Serb and the Montenegrin cease to envy the Bulgarian, and the Bulgarian to vex the Greek; let hatred and hostility cease between Daco-Rumanians and Slavs, between Pan-Slavs and Pan-Hellenes, between the partisans of Milan, Nikita, and the Czar, between Catholics and Orthodox Greeks; let none of the new states become a tool of Russia against Austria, or provoke her to add a new Poland to her enslaved territories; let wisdom, not force, decide whether Constantinople is to be allotted to the Bulgarians, the Greeks, the Russians, or the English; in a word, let there be universal harmony and good will, and soon, where now are heard the groans of homeless Bosniaks, Pomaks, or Macedonians, we shall listen with delight to those lovely songs and ballads of which Talvi, Bowring, and Owen Meredith have brought us faint echoes.

And does not the character of the enfranchised Christian populations warrant such blissful anticipations? Hear Mr. Clark, or rather the enthusiasts whom he so readily copies: The Greeks have always been remarkable for "their tough, long-enduring, indestructible national spirit; their intellectual quickness and versatility; their love of learning; their vivacity and cheerfulness under the most depressing social conditions; their patient industry and irrepressible commercial enterprise; their astonishing aptitude and ability in the conduct of every form of business; their intense love for their native land; . . . their undying, unconquerable faith in their national destiny." More than that, "the housekeeping classes of the Greeks, forming the great majority of the nation, from the Turkish conquest to the present time, have been generally characterized by industry, honesty, sobriety, and domestic virtue." The Servians are "an exceedingly simple-hearted people, so hospitable as almost to reverence the stranger; grave and serious, frank, honest, and dignified, and standing erect in the proud consciousness of a freedom nobly won. Turkish tyranny has had the same levelling effect upon them as upon the Greeks, and has inspired them with a spirit intensely democratic. To the enquiry of a traveller if there were no nobles in Servia, the characteristic answer was returned, '*Every* Servian is noble.'" They are "a quiet, orderly, home-keeping, and industrious people, living in comfort and abundance, of grave and dignified demeanor, almost wholly free from most of the grosser vices which degrade humanity, possessing a temperament in a high degree poetic . . ." "The spontaneousness with which, in Servia, even the most common and prosaic occurrences seem to take on the poetic form, and go flying on the wings of song from one end of the land to the other, is one of the most remarkable facts of modern times, one of the most striking illustrations of the Homeric age." The Montenegrins "are as poetical as their neighbors and kindred, the Servians." Montenegro "is a strange and wonderful little state, the living relic of an age and order of things long since passed away, and clothed, in everything pertaining either to its past history or its present condition, with the most fascinating interest." "The Bulgarians are no less interesting and no less promising than their Slavonian kindred of the tribes farther west." And so on. It is true, qualifications of praise are not wanting, and the dark sides of the pictures are here and there exhibited, especially in the historical portions, which are naturally far from presenting idyllic features; but the general impression almost involuntarily leads to the conclusion that the character and disposition, if not the conditions and prospects, of such nations as the American, the English, or the German might be considerably improved by a century or two of Turkish bondage. Nor is the Turk himself, though his excesses are duly stigmatized, refused a full meed of praise for the better traits of his character, whenever an opportunity offers—for he generally appears only in the background. Though devoutly praying for the final victory of the cross over the crescent, our author shrinks neither from accepting the Rev. T. C. Trowbridge's testimony—based on eighteen years of observation in the dominions of the Sultan—to the effect that life is incomparably more secure in Turkey than in New England, nor from summing up, mainly after Creasy, the immediate consequences of the Ottoman conquest of Constantinople in the following way:

"It cannot be doubted that the Turkish conquest was an actual benefit to the Greeks, wrought a positive improvement in their condition. The Turks were far better men and far abler rulers than the wretched tyrants whom they superseded. As a rule, they were grave, serious, honest, and straightforward, while their vigor and energy in the conduct of affairs made them the wonder of the world. The government was vigorous and well sustained, its fiscal exactions were not severe, order and quiet were maintained, Moslem law was administered with tolerable impartiality, and the Greeks found themselves far better off than they had been before. It seems to be conceded that for the first century following the fall of Constantinople the Turkish dominions were better governed and more prosperous than most parts of Christian Europe; that the people, both Mohammedan and Christian, enjoyed a larger measure of private liberty and of the fruits of their labor than fell to the lot of their contemporaries under the confused and too often tyrannical governments of the West."

Of Mr. Clark's enthusiastic admiration little Montenegro and her prince, Nikita, receive comparatively the largest share, and the pages devoted to her are full of vivid delineations. But they also present the most striking specimens of exaggeration born of enthusiasm. Thus he copies, as a fact, a statement related by a Montenegrin to Sir Gardiner Wilkinson that "in the battle of Krûssa, fought in 1796, . . . thirty thousand Turks were slain" (p. 365), while Frilley and Vlahovitj, in their 'Monténégro Contemporain' (1876), a "livre inspiré par . . . admiration pour l'héroïsme et la constance de ce peuple monténégrin;" reduces the number of the Moslems slain in that contest to "more than two thousand." In the battle of Grahovo, in 1858, "according to the official report of Mirko Petrovitch, the Montenegrin commander," to which alone Mr. Clark makes reference, "seven thousand Turks were slain, . . . while the Montenegrin loss was but forty-seven killed and about sixty wounded" (p. 356); but according to Frilley and Vlahovitj the loss of the mountaineers was "four hundred killed," and that of the Turks "eight or ten times greater." An equally grave error, but one possibly owing to a misprint, is the small figure (p. 512) representing the loss of the Russians and Rumanians in the September attacks on Plevna ("eight thousand" standing for "thirty thousand"?). Misprinted or otherwise inaccurate are also the following parts of sentences: "the accession of Constantine, in 324" (p. 24); "Heraclius . . . before his death, in 642" (p. 27); "Anastafius" (p. 28); "*Cherson* (an ancient Greek colony upon the site of the modern Sebastopol)" (p. 37); "Yannina, or Ioannina, of which *Yannina* is the vulgar pronunciation" (p. 169); "Servia . . . *in the heart* of the Turkish dominions" (p. 379). In the enumeration of the families of the Slavic race (p. 309) the Ruthenians are forgotten, next to the Slovaks; and so are the Poles and Bohemians in the statement (p. 312) which tells us how the Slavs "passed from subjects to masters, and two great empires, the Russian in the north and the Servian in the south, rose to a prominent place among the semi-barbarous powers of Europe in the Middle Ages." The foreign names are generally well spelt, much better than in many similar publications; yet we find—in unquoted lines—Milo*sch* (p. 410), Res*ch*id (p. 433), "Drago*sch*" (p. 472), side by side with "Uro*sh*," "Du*sh*an"; "Skup*tsch*ina" and "Skup*sch*ina," neither of which is correct; "Ternovo" (p. 331) and "Ternova" (p. 458); "Ochrida" (p. 124) and "Achrida" (p. 329); and "Scutari, or Skadar," "Scutari (Scodra)," and "Skodra," all in the text and notes of one page (170).

All these defects, however, are very slight in comparison with the manifold merits of the book. We cannot but warmly recommend it to our readers.

THE FINAL PHILOSOPHY.*

HERE is a volume to excite attention indeed. Harmony is really to be effected between Science and Religion at last. And not only is the venerable dispute to be settled, but it is to be settled by methods exclusively American, we are told:

"The American geography, genealogy, politics, and religion are simply unparalleled, either in ancient or modern civilization, and together form an aggregate of all that is peculiar to the civilizations of Europe, Asia, and Africa. Such a medley of climates, of races, of institutions, of creeds and theories, fusing under one political system, affords materials for a philosophy *which cannot but be final;* and by projecting on a grander scale, and with fuller conditions, all the time-worn issues of history, shows that here, if anywhere, the whole terrestrial problem is at length to be solved."

This solution was not to be expected from the effete Eastern hemisphere. Only in the "wide intellectual and social anarchy" of the West, in the "swift and intense passions" seething in the fiery but favored clime of New Jersey, could the grand Final Philosophy be evolved "to educe order from this chaos, and mould the ideal reign of truth and virtue." A whole academic curriculum is to be devoted to moulding this reign, to developing this new philosophy. The whole realm of knowledge is to be reviewed, and "science is to be expurgated" thoroughly. "The salt of truth is to be cast into the living fountains, and the stream of intellectual and moral corruption will be cleansed; the evils of the

* 'The Final Philosophy, or System of Perfectible Knowledge, issuing from the Harmony of Science and Religion. By Charles Woodruff Shields, Professor in Princeton College, etc.' New York: Charles Scribner & Co. 8vo, pp. 609.

church, the state, and the life will be cured, and a current of new and vitalizing ideas poured through the whole social body."

It was too much, perhaps, to hope that so magnificent and complete a system should be made clear in six hundred large pages, even to an American audience; but the author leads us on with continually growing curiosity to the last, when he suddenly decides to disappoint it altogether. Evidently one must go through the whole Princeton course in order fully to imbibe the salt current, and cure all the evils of life in its rule of "order, law, and love." The disappointment is a painful one, it must be confessed; for five hundred and eighty-five long pages one climbs with the author his "difficult ascent of thought," his imagination fixed and his energy fired by the "inconceivable glory" that he is told to expect, but he wins no glimpse of the promised land as a reward. And if he is too old to attempt the Princeton curriculum, or his physique is unsuited to the peculiar requirements of Princeton college life, he will lay aside the volume in profound grief at his loss. But is this decision as final as its author's philosophy? Might not an urgently-expressed public desire spur the author to another six hundred pages—nay, to whole series of six hundred pages, which should bear the whole world forward on its mighty current? The first essay has been cordially received, if it has not been much read. May we not have some hope for the future? Almost a score of years have been devoted to it by its author, he tells us, and a collegiate chair secured expressly for its support. What a loss it would be if it were to perish unwritten!

Even if this hope is to be ungratified—though we would not too hastily resign it—those who have not had the opportunity to try the Princeton system will seek with avidity so much of its "order, law, and love" as this volume can furnish. They will delightedly rehearse with Professor Shields the long struggle of positivism and idealism (or absolutism, as he prefers to call it), even if they cannot be in at the death. And there is much to learn in this work. Not only are there seven or eight hundred authors comprehensively compressed into its covers, but the novel and ingenious criticism with which it is attended is most striking. If the reader examines the "present state of the sciences," for example, he will learn that Darwin has no claim to the discovery of the theory of natural selection by the survival of the fittest, but merely deserves mention for collecting proofs that man may thus have fought his way upwards from the inferior races (p. 445); that not only Spencer, but Bacon, D'Alembert, Comte, and Mill held that the final goal of the sciences was either "sheer nescience or the recognition of an unknowable reality as the ground of all knowable phenomena" (p. 450); that the nebular hypothesis and the development theory, amongst others, "are not purely scientific." "There is not even any spontaneous concurrence of scientific men respecting them, such as that which attends all observed facts, ascertained laws, and approved theories" (p. 451). Hamilton and Spencer are both positivists, he says; but that need not trouble the absolute thinker, for positivism, he shows, may be overthrown with an ease hitherto unsuspected. We have but to observe that all men do not pass through the three stages of Comte—that all nations have not been first fetishistic, then metaphysical, and lastly positive—and we see how baseless and unsubstantial the whole structure of positivism is, and how little weight we need give to the arguments of Lewes or Mill. The ease with which the thing is done is delightful; one can only wonder that the flimsy affair has held together so long.

Although the final harmony of religion and science is not rehearsed to us here, there are a few hints of the key in which it will be pitched, a few glimpses of the method of the movement. The two combatants have fought hard and well, but the final peace is not to be reached by the complete triumph of either. The gashed and bleeding knights are not to be allowed to fight it out. The new philosophy borrows an idea or two from the political sphere, and the dispute is to be submitted to a foreign tribunal. A compromise is to be effected, and an umpire is to be chosen. Princetonian philosophy is to decide the matter once for all, and inaugurate the "ideal reign of truth and virtue." Each party is to concede a little, of course. The religionist is to recognize established scientific facts. The scientist is to cease to ignore the other's "vast body of truths, doctrines, dogmas, backed by evidences which have been accumulating for eighteen centuries." That is all, and what could be fairer? The one is to admit that the process of creation is not set out in the Holy Scripture, or, in other words, to abandon the Mosaic account of creation. The other admits pretty much every thing else. The facts are to be conceded, but no inferences drawn from them. When these concessions have been frankly made the umpire is to step in, and the Final Philosophy be declared once for all; and as her decision is to be based on natural theology and the Christian evidences, including the miracles and the invariable divine response to genuine prayer, neither side can object, of course, and all will be sweetly harmonious. On such a prospect one can look with hope, even if he has not been through Professor Shields's "expurgated sciences," or learned exactly what the final philosophy is to be. And notwithstanding a few minor errors in the volume, such as the numerous misspellings of proper names, we join with pleasure in the appreciative conclusion of one of our "esteemed contemporaries" as to the volume, "that, whether for wealth of erudition, clearness of apprehension, or perspicuity of statement, no recent publication of the American press is more conspicuous than this volume."

Red Eagle, and the Wars with the Creek Indians of Alabama. By George Cary Eggleston. (New York: Dodd, Mead & Co. 1878.)—This is one of the series of "Famous American Indians," and meets a want in so far as it is the only book yet published devoted exclusively to the history of the Creek war ended by the battle of Tohopeka, or the Horse-Shoe, March 27, 1814, and to the character and achievements of Red Eagle, *alias* William Weatherford, the principal Creek warrior. The work has very properly rescued from oblivion the name and fame of an aboriginal military genius. Details about Tecumseh, Pushmatahaw, and Generals Jackson, Clairborne, Coffee, and other actors in an important struggle, as well as of the operations of the British and Spanish allies of the insurgent Indians, are also collated from numerous sources to the general advantage of historic truth. It is, however, to be regretted that the literary execution will not render the volume attractive to the public. The romantic incidents of the war were quite equal to those of the Siege of Detroit, but we miss the vivid descriptions by which Parkman gave to his 'History of the Conspiracy of Pontiac' such absorbing interest. The origin and peculiar constitution of the Muskoki Confederacy merited the same philosophic treatment that made Morgan's 'League of the Iroquois' a text book for ethnologists, but this production is a meagre contribution to knowledge in that direction.

Only one serious error need be noted. The author gives with some approval a story of the migration, during a considerable time, of the Muskoki to their seats along the Alabama, Coosa, and Tombigbee rivers, after they had fought with the Aztecs against Cortez; that is to say, they took up their march northward only when the Spaniards had succeeded in their Mexican conquest. This legend does not agree with others much better authenticated, and is liable to the criticism that De Soto in 1540 found the same tribes in apparently long-established towns substantially where they remained until the present century, whereas the conquest of the City of Mexico was in 1521, only nineteen years before De Soto's visit. At that time not only the grand divisions of the Muskoki, such as the Chahta and the Chicasa, but the several smaller bodies, showed such dialectic disagreements, as well as sociological distinctions, as to render it certain that their permanent separation, subsequent to any common migration of the linguistic family, had commenced many years, and probably several centuries, before the Columbian discovery.

THOMAS HARDY'S NEW NOVEL.

The Return of the Native.

16mo (Leisure-Hour Series), $1.

"It takes high rank among the good romantic work of the generation. I know of nothing in later English so striking and on the whole so sound as the several pictures of Egdon Heath, or the introductory analysis of 'Eustacia Vega.' . . . The novel is so clever and so strong that it excites both interest and admiration, and takes a first place among the novels of the season."—*London Academy.*

"It is a wonderfully interesting story."—*Boston Transcript.*

Eclectic Magazine

OF

Foreign Literature, Science, and Art.

THIRTY-FIFTH YEAR.

The ECLECTIC MAGAZINE reproduces from foreign periodicals all those articles which are valuable to American readers. Its field of selection embraces all the leading foreign Reviews, Magazines, and Journals; and, while the tastes of all classes of readers are consulted, nothing trivial in character or of merely transient interest is admitted to its pages. Its plan includes ESSAYS, REVIEWS, BIOGRAPHICAL SKETCHES, HISTORICAL PAPERS, TRAVELS, POETRY, NOVELS, and SHORT STORIES; and in the case of SCIENCE (to which much space and attention are given) no special prominence is allowed to any particular phase of opinion, but place is given impartially to the most valuable articles on both sides of the great themes of scientific discussion.

Among the writers of recent articles may be named the following:

RT. HON. W. E. GLADSTONE,
ALFRED TENNYSON,
PROFESSOR HUXLEY,
PROFESSOR TYNDALL,
R. A. PROCTOR, B.A.,
J. NORMAN LOCKYER, F.R.S.,
DR. W. B. CARPENTER,
E. B. TYLOR,
MATTHEW ARNOLD.

☞ It is frequently remarked that in England the best literary talent of the time is being diverted from the writing of books to contributing to the periodicals. The ECLECTIC garners the choicest sheaves from this rich harvest.

STEEL ENGRAVINGS.—Each number contains a fine Steel Engraving—usually a portrait—executed in the best manner.

Terms: Single copies, 45 cents; one copy, one year, $5; Trial subscription for three months, $1; the ECLECTIC and any $4 magazine to one address, $8. Postage free to all subscribers.

HENRY C. MEYER & CO., 46 and 48 Cliff Street, invite all persons having Water-Closets insufficiently supplied with water to call and examine their "Waste-Preventing, Sure-Supply Cistern." It can be applied to any water-closet now in use at slight expense. No closet basin can remain foul where it is used. Like all other appliances made by them and bearing their stamp, they are kept in repair three years in this city without charge. They have numerous other specialties and designs showing proper arrangement of drain-pipes in dwellings, to which they invite examination by architects, householders, and all other interested persons.

Fragrant Vanity Fair.

A NEW CIGARETTE,

Gotten up in honor of the Paris Award. Each Cigarette bears cut of the Paris Medal and brand, Parisian style. Our Tobacco and Cigarettes are better than ever, and unsurpassed for Purity, Delicacy, and Excellence. Special size Cigarettes, with any NAME, MONOGRAM, CREST, or DESIGN, to order, at $5 for 500. Samples on receipt of postage stamp. Samples of our Asthmatic and Catarrh Cigarettes, each, 25 cents by mail.

WM. S. KIMBALL & CO., Rochester, N. Y.
Peerless Tobacco Works.

Atlantic Mutual

INSURANCE CO.

NEW YORK, January 23, 1878.

The Trustees, in conformity to the Charter of the Company, submit the following Statement of its affairs on the 31st December, 1877.

Premiums received on Marine Risks from 1st January, 1877, to 31st December, 1877	$4,710,665 83
Premiums on Policies not marked off 1st January, 1877.	2,040,362 61
Total amount of Marine Premiums	$6,751 028 44
No Policies have been issued upon Life Risks, nor upon Fire disconnected with Marine Risks.	
Premiums marked off from 1st January, 1877, to 31st December, 1877	$4,902,331 08
Losses paid during the same period	$2,565,890 27
Returns of Premiums and Expenses	$947,923 86

The Company has the following Assets, viz.:

United States and State of New York Stock, City, Bank, and other Stocks	$10,565 958 00
Loans, secured by Stocks and otherwise	1,163,200 00
Real Estate and Claims due the Company, estimated at	617,436 01
Premium Notes and Bills receivable	1,764,353 63
Cash in Bank	255,364 02
Total Amount of Assets	$14,366,351 66

Six per cent. interest on the outstanding certificates of profits will be paid to the holders thereof, or their legal representatives, on and after Tuesday, the Fifth of February, next.

The outstanding certificates of the issue of 1874 will be redeemed and paid to the holders thereof, or their legal representatives, on and after Tuesday, the Fifth of February, next, from which date all interest thereon will cease. The certificates to be produced at the time of payment and cancelled. Upon certificates which were issued for gold premiums the payment of interest and redemption will be in gold.

A dividend of forty per cent. is declared on the net earned premiums of the Company, for the year ending 31st December, 1877, for which certificates will be issued on and after Tuesday, the Seventh of May, next.

By order of the Board, J. H. CHAPMAN, Secretary.

The Nation.

NEW YORK, THURSDAY, JANUARY 9, 1879.

The Week.

THE opening of the new year is justly regarded by enterprising publishers and editors as an important epoch both from a moral and pecuniary point of view. It is the period when an account of the profits and losses of the twelvemonth is taken, and when, with the expenditure of much intellectual labor, the judicial retrospect of the past editorial course of the paper, coupled with its programme and unwavering fidelity to the cause of truth and of right for the ensuing year, is prepared, and when there also appears the annual list of Webster's Unabridged Dictionaries and other premiums to stimulate the good work of subscription. It is not only with his own future that the journalist busies himself at the opening of the new year, but with that of his readers as well, and it is seldom that he omits on New Year's day the publication of a few appropriate remarks suggested by the recurrence of the day. It is creditable to human nature (to say nothing of the profession of journalism) that these New-Year reflections should invariably have a moral tendency. No cynicism or levity is tolerated, and we notice that the *World*, which has developed of recent years a marked tendency toward a flippant treatment of subjects always treated seriously by its contemporaries, pays at least a silent tribute to the cause of morals by refraining from making any studied reflections upon the new year. The other papers devoted on the first of the month a considerable amount of space to the subject, and we are glad to see that on the whole they take a bright view of the future. The *Herald* thinks that we are "at the beginning of a better era," and even sees hope for the holders of "stagnant real estate." The *Times* discusses the subject in beautiful language, and though admitting that "it needs all the warmth of "feeling that we can get from anniversaries like that of to-day to sustain us in the belief that selfishness and cruelty and greed are not after all the strongest impulses in human nature, and the most powerful forces in moulding the future of manhood," still expresses the opinion that "it is only those who have ceased to regard the past with tenderness or the future with hope (obviously a small class) that the salutation of the day will be regarded as impertinent or meaningless," and that no matter what illusions the stern teaching of experience robs us of, "it is long before it can strip from the future the possibility of having something in store for us which we have missed in the past." The *Tribune* is apparently not only satisfied with the prospect for 1879, but extracts more satisfaction than we fear most persons will be able to share from a retrospect of 1878. "No poet," the *Tribune* justly remarks, "has painted purgatory as a place of rejoicing," and "penalty, expiation, purification by fire and by suffering, have made 1878 the purgatorial year, especially to the Anglo-Saxon nations, whose pride is to assume the responsibility of leadership in the world's civilization." Nevertheless this glorious race has, according to the *Tribune*, come up to the mark and met the trials to which it has been subjected "in a manner worthy of itself." It finds resumption a hopeful sign, as also the Republican victory in the fall elections, and particularly dwells upon the exposure of an "attempt by bribery to deprive a free people of self-government," though it does not say by whom the exposure was made or who attempted such a dastardly act.

The most important financial event of the week was the beginning of specie payments by the United States Treasury on the morning of the 2d inst. There was no rush of holders of legal-tender notes for gold payment, nor did public interest in the event rise to the point of excitement. Whatever shock there was to be should have been on the first day, and on that day the Treasury paid out for legal-tender notes $130,000 gold, and took in $400,000 gold in exchange for legal-tender notes. Since then the receipts of gold for legal-tender notes have been from four to five times larger than the payments of gold for the notes, which shows that when every one knows that the notes are the equivalent of gold the former are preferred for convenience. As soon as the Treasury had demonstrated its ability and willingness to pay its demand-debts, which is what the legal-tender notes are, a renewed demand for its time-debts, or bonds, was developed, and during the first week of resumption something over $35,000,000 of 4 per cents. were subscribed for. Already $30,000,000 of the 6 per cent. bonds have been called in for redemption on account of the sales of 4 per cents., and at the close of the week there is no abatement in the activity of refunding. To the banks is due the credit for a good part of the subscriptions, and they are moved by the tempting profits to their interest accounts. The January interest and dividend payments this year are not far from $60,000,000. A part of this is going into United States bonds, but a larger share than usual is going into securities which in no event can be paid with silver dollars. An illustration of this is furnished by the sale of $1,600,000 gold bonds of one of the city Elevated Railroads in less than two hours, and before the bonds had been publicly offered through the advertising columns of the newspapers. For the first week in seventeen years there was no gold market, and the Gold Room was given up to transactions in United States bonds. The money market was easy throughout the week. In London there was a decline in the discount rate; nevertheless, sterling bills here advanced to $4 88 for demand and $4 83½ for sixty days, because the cold weather and the snow blockade had interfered with the export movement. Silver remains at 49½*d.* to 49⅝*d.* per oz. in London. Here the bullion value of the 412½-grain dollar is $0.8391.

There ought to be a certain modesty and reserve in the rejoicings of some persons over the ease with which the resumption of specie payments has taken place. The Cincinnati *Commercial* and the Cincinnati *Gazette*, for instance, broke down utterly in their support of resumption in the summer of 1877 at a most critical period, and began clamoring for a "modification" of the Act (which would undoubtedly have operated as an indefinite postponement) by adopting the Democratic plan of not saying when we were going to resume, but preparing for it, as the St. Louis platform said, "by a judicious system of preparation by public economies, by official retrenchments, and by wise finance." Of course nobody knew what this talk meant, but the two papers we have mentioned, and the Chicago *Tribune*, next to the *Commercial* the great silver prophet of the Western country, pretended they knew, and began throwing cold water on the prospect of resuming in 1879. The editor of the *Gazette*, indeed, delivered an address to the Cincinnati Chamber of Commerce showing that the Act could not and ought not to be executed. It strikes us, therefore, as unbecoming in this gentleman (who in this instance cannot be allowed the benefit of the "wicked-partner" defence) to point out now in his paper, after explaining the support which irredeemable paper gave to the various forms of money mania, that "the arrival of resumption without a jar and the revival of confidence which this will effect, and the beneficial effect of this on industry and commerce, will take away the occupation of all these shallow inventors."

Mr. Thurman has replied to the request of the Teller Committee that he would furnish them with specifications as to the "outrages" which he wishes to be investigated; and it turns out that he, like Mr. Blaine, knows nothing about the matter except what he has seen in the newspapers; but he is more ingenuous than Mr. Blaine, for he frankly confesses the fact. So he declares that he will send in from time to time any indications which come to his knowledge.

"Instalment No. 1," as he calls it, consists of an editorial article cut from the Washington *Post;* a copy of a petition of sixty-odd citizens of New York; a copy of an opinion of Judge Freedman touching the rights of naturalized citizens in New York; a speech of Senator Wallace; a letter of the Hon. William D. Kelley; an editorial article from the Vermont *Argus and Patriot;* a copy of the President's civil-service order, and one of the circulars sent out previous to the last election by Mr. Geo. C. Gorham, the Secretary of the Republican Committee, to Government employees and contractors. We suspect that this last "specification" is the only one that will open up a profitable line of enquiry. The Committee has begun taking testimony at New Orleans.

"A Young Men's Progressive Association" has been formed by the leading colored men of Louisiana for the protection of the Freedmen in the exercise of the franchise, which is a very good move. But we are sorry to see that they have begun operations by the publication of a highly rhetorical address on "outrages," the language of which, like that of most documents of this kind, is so extravagant as to defeat its object. It gives a list of numerous murders in a highly poetic vein—alleging that in certain parishes "victims of local self-government were left hanging by scores to the trees," and in others the bodies of the murdered persons were left "to feed the vultures and prowling beasts of the forest." As a general rule hitherto, when murders at the South have been described in this way, the murdered persons have subsequently been found, like the Methodist minister in South Carolina last year, sitting by their own firesides in happy ignorance of their fate. Is it not possible for the colored voters at the South to get up a sober-minded and sober-tongued organization of some kind which can tell a quiet and circumstantial tale without passion or vituperation about their political doings and sufferings? Stuff like the address of the Louisiana association, though received with a certain mock reverence in the Stalwart newspaper offices, makes no impression on public opinion.

General Sheridan in his last annual report gave a sorry account of "the Indian situation" on the frontier. The Indian Department, he said, owing either to "insufficient appropriations or wretched mismanagement," had given "the settlements in the Western country constant anxiety during the past year," besides causing murders and loss of property. There had been "an insufficiency of food at the agencies," which made the Indians desperate, except in the case of the Red Cloud and Spotted Tail bands of Sioux, who had been so well supplied and "humored" that their "increasing insolence constantly threatened to bring about a breach of the peace." These statements Secretary Schurz, we think with perfect accuracy, described, in a letter to General Sherman, as "sweeping charges against all the agencies in the military division of the Missouri, except the Red Cloud and Spotted Tail Sioux agencies," and asked for the facts on which General Sheridan based them; but he asked it in terms which clearly enough indicated his belief that they would not be forthcoming.

This irritated General Sheridan, who now makes a "supplemental report" in reply, in which he says "he made no charges against the Honorable Secretary of the Interior, and made no charges against any one," and that "his object was to show" that Indian wars resulted "from the bad management in Indian affairs," and that the Secretary of the Interior was "disingenuous" in saying that he had made charges "as to corruptions at every agency in the limits of this military division." General Sheridan is a good soldier but evidently a very poor dialectician, or he would see that he did make against every agency in his division but two the charge of starving the Indians, in as plain language as a writer not used to the pen could be expected to make it. What evidently deceives him as to the nature of his language is that he did not intend his statements to be regarded as formal accusations against anybody, but as information for his superior officer; and what he meant by saying that the Secretary has been "disingenuous" in calling on him for proof, is that he (the Secretary) is taking an unwarrantable liberty in trying to convert him into a prosecutor. He then goes on, though in a somewhat rambling way and with very unseemly violence of language, to call attention to the reports of fraud and mismanagement from army officers at half a dozen agencies, fortified with extracts from reports to the Board of Indian Commissioners, but fails to say when these abuses occurred, or whether it was not, as we believe it was, before Secretary Schurz's day. He also charges, and with considerable force, that the Red Cloud and Spotted Tail Indians were removed from the Missouri River under the influence of traders and contractors, who desired more business in hauling and selling supplies from the Union Pacific Railroad, which is now the base instead of the river. He annexes a report from Lieutenant Lee, of the Ninth Infantry, with regard to fraud and mismanagement at the Spotted Tail Agency, of which it is useless to give the details; it is the same old story.

The evil in the Indian service is the one which afflicts all departments of the public service, though more easily combated by supervision in some places than others—the small attraction of the public service for the requisite grade of men, and the small provision made by the conditions of the service for the promotion of honesty, and for fortification against temptation. Secretary Schurz is simply wrestling with the problem with which all the other Secretaries are wrestling, but under vastly greater disadvantages, because he has to use at remote points on the plains, out of reach of public observation, to carry on business with savages, persons who could only be kept to their duty by a rigid oversight in Washington or New York. General Grant's plan of handing the job of taking care of the Indians over to the religious denominations was simply a confession that the Government was unable to discharge one of its most important functions through its own agents. He might almost as well have handed over the management of the Treasury to the Bible Society, and called on the Board of Foreign Missions to conduct the Post-office. The great question now is, How long shall we wriggle and dodge and put up with fraud that cries to Heaven, in order to avoid a "thorough, radical, and complete reform" of the civil service, which should be officered by self-respecting men who could be trusted out of sight, and to whom their good name and their office would have more value than even "four years' good stealing"?

The Government Directors of the Union Pacific Railroad have made their annual report, which is, on the whole, unfavorable. They say that, considering that it was built mainly with Government money and designed to be "a great national thoroughfare," and that it has proved a great pecuniary success, its net earnings last year reaching fifty-eight per cent., they have felt bound to judge its condition not by the standard of the new roads west of the Mississippi, but by "the highest standard known in the railroad system of the country." Judged by this standard the deficiencies are many and apparent. There is no sign of first-class, uniform management. No uniform system is followed in filling the subordinate places, and the officers, coming from all sections of the country, bring with them varying methods and theories. Only 29 out of 1,026 miles of the iron rails have been replaced by steel; and the stations are in a bad condition, showing that the percentage of operating expenses has been too low. The policy of the company, too, has not been "public-spirited," or far-sighted or liberal in the matter of building up business along the line, although the rates cannot be considered extortionate. The report criticises the Senate Judiciary Committee, in reporting the Pacific Railroad Funding Bill of last session, for holding out the prospect of large net earnings as something probable and very desirable. The repayment of its own debt ought not, however, to be the sole concern of the Government in supervising the management of the road. It should, the Directors think, throw its influence on the side of a liberal policy towards the

public rather than on that of high immediate profits. Mr. Charles Francis Adams, jr., one of the Directors, has resigned, on the ground that no person can give the time required for a proper and thorough inspection of the road for the compensation now paid, and that the compensation, such as it is, comes, with divers civilities, not from the Government whose agent he is, but from the corporation whose doings he is to overhaul, which places him in an embarrassing position. The Government Auditor created by the late Act of Congress is, he thinks, competent to take care of the interests of the Government as the creditor of the company, but the work of supervising the working of the road itself cannot be done by persons appointed and paid as the present Directors are, and he pronounces them useless and withdraws from their number.

The charges brought by the Bar Association Committee against the Sheriff, the Register, and the County Clerk must almost necessarily result in the removal of the officers by the Governor. There is practically no denial of the facts by them; and Mr. Gumbleton's refusal to produce his books for the inspection of the Investigating Committee is, under the circumstances, not very different from a confession that he has no books to produce. The investigation may be regarded either as an honest attempt to prevent illegal extortion on the part of officials whose position gives them peculiar opportunities for imposition, or as a political movement. As a matter of reform in the public business, there can be no doubt that the Sheriff's office has richly deserved attack for a long time. It is, under our system, a position which is given from time to time to favorites of the "Boss" in order to make a fortune. The business of the office is so large that the legal fees would probably remunerate a Sheriff liberally, but little regard has been paid to the statutes. It is obviously very difficult for the public or members of the bar individually to protect themselves against this; it is for the interest of all lawyers having dealings with the Sheriff or his representatives to be on good terms with him, and lawyers who are not on good terms with him are apt to suffer for it in one way or another. This is true to a certain degree of the Register and the County Clerk as well. For lawyers who stand upon their rights and refuse to pay the regular charges of these officials, whether they are legal or not, searches of title are made more slowly and legal documents drawn up less willingly than for those who pay without complaint; and there is no easy way of either proving or punishing this sort of discrimination. There could not, therefore, be a more legitimate or praiseworthy channel for the moral energy of the Bar Association than an investigation of this kind, and if it should result in a reformation of the system it would confer a lasting benefit upon the community.

Mr. Goldwin Smith has written a letter to the Manchester (England) *Examiner*, in which he describes the regulations of "the court circle" in Canada, including the doctor's certificate for the ladies with the high-necked dresses, and points out the demoralizing effect the court is likely to have on Canadian manners, taking substantially the same view as that presented in our own columns. It will set a simple democratic society aping customs which are essentially foreign, and which have no real significance for them and do not grow out of their own thoughts or feelings, and it will plunge hundreds of poor people into ruinous expense. But when he says that it is likely to embroil the Canadians with this country he is decidedly mistaken. Those Americans who pay much attention to the doings of the Canadian court are not only not troubled by them, but would like to be on the spot and mingle in them themselves, and would gladly either wear the low-necked dress or the high-necked one with the doctor's certificate annexed. They are not persons of a philosophical turn of mind, either, and would not be in the least concerned by the probable effect of their performances on Canadian society. Indeed, if the "A. D. C. in waiting" at Ottawa is overworked, we could reinforce him with a "Brigadier-General in attendance."

Another bank—the Cornish Bank—has gone down in England, with liabilities estimated at $5,000,000. A large amount (about half a million) is said to be due to it from the mines of West Cornwall, the calling-in of which will suspend work and cause great distress in that region. The cause seems to be much the same as in the case of the Glasgow Bank and the West of England Bank—poor investments or loans, shrinkage, loss of confidence, and finally a run. The rapid succession of these catastrophes, and the revelation they are making of the worthlessness as security of the unlimited liability of the shareholders, is raising the question whether some legislative provision should not be made to keep down the size of the business undertaken by any one bank. The power of judicious investment possessed by any one man or set of men is limited, and so is the pecuniary responsibility of the stockholders; but the public apparently does not think so, and pours deposits in enormous amounts into concerns which can only manage them in the very best times. In the meantime the distress at all the great centres of industry is increasing, and there is no sign whatever of improvement in business; but the distress is not as yet anything like what it was in the cotton districts in 1862.

The vote of the Bishops in the House of Lords on the late amendment to the address approving of the conduct of the Ministry in the Afghan War is causing apparently a good deal of pain and scandal, among churchmen of the Liberal party at least. The war is an aggressive war, and the best that can be said of it is that it is offensive-defensive, that is, that it is an attack on a man who may at some period or other, if let alone, join in an attack on England—a consideration which might be excusably dominant in the mind of a mere soldier or mere politician. But people expect moral considerations to have more weight with Bishops than political or military ones; and when eight out of the nine Bishops present in the House of Lords voted with the Jingoes for the Afghan War, even the Jingoes were a little ashamed. The Bishop of Manchester, Dr. Fraser, who was unavoidably absent, has written to say that had he been present he would have voted with the Ministry; but the Bishop of Gloucester has written a letter explaining his vote, which makes matters a little worse. He says he voted as "a minister of the Gospel" as well as a politician to keep up British influence in India, "for be it remembered," he says, "the decline of English influence means also a decline in the advance of the Gospel." The plan of promoting "the advance of the Gospel" in India by carrying fire and sword into another country at the bidding of a Jew who secretly laughs over the Gospel, is probably odder, considering the quarter from which it comes, than any of the many odd things produced in England by the outburst of "Imperialism."

The French Republicans have achieved an extraordinary and unlooked-for triumph at the senatorial elections on the 5th instant. The best result that even Gambetta expected from them was a Republican majority of 20 to 25. It will probably reach 57. Of 47 retiring Conservative senators only 13 have been re-elected, while all the retiring Republicans have been elected, and the ruin seems to have overtaken all shades of Conservatism indiscriminately—the Bonapartists and Legitimists have gone down together. One of the curious incidents in the conflict has been the total defeat of M. Renan. He ran in the Bouches du Rhône, but did not receive a single vote, which is probably his punishment for being too gloomy about the condition of French society ever since 1870. Several Departments hitherto held by the Conservatives have been completely cleared of them. This great victory may be said to determine definitively the form of the French government, and to put a complete stopper on all monarchical expectations. The Republic now established has come in a way which promises durability—that is, it has not been set up in a burst of popular enthusiasm, but has slowly gained the popular confidence throughout the country, in the teeth of desperate opposition, by an actual exhibition of governing capacity in most difficult times. The Legitimists have lost the best chance they have had since 1815, and they probably now disappear finally from the political arena, to pass into poetry like the English Jacobins.

PREPARATIONS FOR THE PRESIDENTIAL CAMPAIGN.

SPECULATING about the next President a year and a half before his nomination would seem to be a sort of work which were best left to professional politicians, particularly in view of the notorious fact that the persons most talked about beforehand seldom obtain the nomination. But the whole country gets drawn into it, as well as the politicians, by the fact that both the party in power and the opposition begin at least two years before the nomination to regulate their policy and their utterances with strict reference to their probable effect on the Presidential contest. At this moment both Republicans and Democrats are considering the best mode of getting rid of all superfluous baggage and reaching the opening of the campaign with as little encumbrance and responsibility as possible, and will accordingly resist firmly all attempts to burden them with any measure or view the effect of which on the popular mind is at all doubtful or cannot be ascertained in time. The most trustworthy reports from Washington represent the Republicans as having virtually settled down into the belief that their true course is to advocate hard money and "wave the bloody shirt" up to the meeting of the Convention. The great advantage of this course is that it would not entail any responsibility of any kind. The restoration of specie payments is an accomplished fact, of which the Republicans are fairly entitled to the credit, and which will probably grow steadily in popular estimation between now and the meeting of the Convention, and to which they will be able to "point with pride" in the platform with considerable effect. It is a fact, too, which will need no nursing at their hands. The Democrats will between now and 1880 have a majority in both Houses, and will have to shoulder the responsibility of protecting the gold against any damage from silver in case of a turn in the balance of trade, while the Republicans will only need to look on and give wholesome advice. The public, too, and especially the commercial public, will grow more and more satisfied with the gold standard, and more and more averse to any further tinkering with or disturbance in the currency, so that the task of the Democrats whenever the silver problem and greenback problem come up for final solution, as they assuredly will before very long, will be very puzzling and delicate. They will have an opportunity, which will doubtless be anything but welcome, of showing what they meant by the mysterious talk of the St. Louis platform about "public economies," "official retrenchments," and "wise finance." We incline to the belief that they will before 1880 turn another financial somersault and come out as furious supporters of hard money of the Jackson school—a performance which will be much easier of execution than their last one of rising up in support of paper, but it will inevitably involve more or less scandal and discredit. No advantage would accrue to them from it but the increased "availability" of Mr. Bayard, in whom they have a candidate whom the Republicans cannot match in any particular; but it seems hardly possible that any revolution in Democratic opinions or policy could now go deep enough to give him the nomination.

The election troubles at the South, which are to furnish the Republicans with the remainder of their programme, have almost as many electioneering advantages as the defence of sound currency. In three States, South Carolina, Mississippi, and Louisiana, in which there are negro majorities and in which a free vote would almost certainly result in the restoration of governments of the carpet-bag type, there is sure to be violence and intimidation before every election until by some agency or other the negro vote is divided. This of itself will furnish the Stalwart wing of the Republican party with an excellent cry, because it will impose on the party no responsibility of any kind. It will furnish abundant materials for invective without calling for any attempt at legislation or other action, which is just what judicious managers preparing for a canvass like. There is, too, a way of looking at it which such Stalwart papers as the *Tribune* manage very dexterously, and which takes with a class of Republicans who are not Stalwart in the strict sense of the term. It consists in saying with an air of candor that the "bayonet rule" was all wrong and was rightly brought to an end, and that the discontent and turbulence of the Southern whites under it were perhaps excusable, but that, now that it is over, further interference with the negro vote is wholly inexcusable and unfair. The fact is, however, that "bayonet rule" has not existed at the South since the revolted States were reconstructed. The carpet-bag governments were regular governments of the majority, but it so happened that the majority did not possess the physical force of the community, and their rule was of a kind which the minority felt justified in overthrowing by armed force, and what the Federal troops did was to prevent this revolt from taking place. In the States we have mentioned a free and uninfluenced negro vote would probably still result in setting up other governments of the carpet-bag type, which would, if once set up, be again entitled to call for Federal aid. It is to prevent this that the whites exert all their moral and social influence, and, when these are exhausted, resort to violence—a view which is strongly supported by the fact that in the States in which there is a clear white majority there are no election troubles at all. Consequently, although the withdrawal of the troops has caused the overthrow of the negro governments, it has not effected a radical change in the situation. Nothing will do this but the disappearance of all danger of the ascendency of a colored party in State politics. Troubles capable of use for electioneering purposes at the North, though wholly unamenable to Federal treatment, may therefore be looked for for an indefinite period, and, if dexterously handled, will give more or less advantage to the Republican party.

The present Administration will, at the end of its term, have rendered the party three inestimable services in relieving it of responsibility for the condition of the South, in restoring specie payments and completing the refunding of the public debt, and in effacing the remembrance of the scandals of the Grant régime by four years of, on the whole, pure and orderly government. But the weakness of the President and his Cabinet in the matter of party allegiance has so exasperated the managers that probably no attempt to "point with pride" to all this will be made, and the party will thus be deprived of what has hitherto been a very useful weapon. For still stronger reasons it will probably not raise again the banner of civil-service reform. The greatest misfortune, as we have often maintained in these columns, that could befall this reform was to have it taken up in theory with ardor by a President of unquestioned sincerity and tenacity, and then either abandoned or disregarded without explanation when the time came for practice. This misfortune has befallen it. A large number of Mr. Hayes's appointments have been made on the worst principles of the worst times, and have given office to many bad characters; and yet it has all been done with an air of simplicity and fidelity which of course warrants the unregenerate politicians in concluding, and saying, that when he used the famous phrase of his letter of acceptance he was talking about an abstraction, and had no definite idea in his mind any more than the "theorists" who were egging him on. The result of this has been, of course, to discredit the agitation on this subject, and to encourage the upholders of the old system in declaring that it is the one best suited to American habits and traditions, and that, anyhow, there is no getting rid of it.

Another result of it is undoubtedly to revive the talk of General Grant as a candidate, and to rouse the activity of his old friends and companions. The abuse of his appointing and removing power did more than anything else to disgust the country with his administration, and to procure the insertion of the civil-service plank in the Republican platform. Mr. Hayes's failure on this point has, therefore, acted somewhat as an apology or justification for him, and in the eyes of his followers removed the most serious obstacle to his reappearance in the political arena. Their hopes, too, are still further stimulated by the dissolution of the small but active band of malcontents who were known as Independents before Mr. Hayes's nomination. One of General Grant's supporters, in fact, the other day enumerated with gusto, among the obstacles removed from his path, the entrance of Mr. Schurz into the present

Cabinet; the change in the management of the Chicago *Tribune;* the loss of influence of the Cincinnati *Commercial* through its maniacal treatment of the currency question; the death of Mr. Bowles, of the Springfield *Republican;* and, though last not least, the desertion of the New York *Tribune.* We do not think these things are great gains for General Grant, for we do not believe he will be nominated, but they undoubtedly are gains for the school of politics he represented, and which will probably have great—let us hope not fatal—weight in the Republican Convention. It is possible for the party by a great mistake this time to lose all chance of a return to power in twenty years; for assuredly, if the Democrats get hold of "the machine" in the condition in which the Republicans are now disposed to leave it, they will work it in a fashion which will give even Mr. Conkling new light as to its capacity.

THE EXTRADITION OF CRIMINALS.

THE State Department has published the Report of the British Royal Commission on Extradition, forwarded by Mr. Welsh last summer. The Commission consisted of some of the most eminent lawyers of England, including Lord Chief Justice Cockburn, Sir James Stephen, and Alfred Henry Thesiger, and the conclusions at which they arrive must command assent not only in England but in this country, where the questions at issue are almost precisely the same. They report that the practice of extradition rests both on what may be considered an international motive, *i.e.*, the common interest of mankind that offences against person and property shall be punished, and on the local interest of the state into which the criminal has fled in having him removed from its borders; that on the first ground it is reasonable to claim a union among civilized nations in a system for the common benefit of all—in other words, reciprocity; on the second that even if any state should fail to concede full reciprocity, there is no principle which should make England unwilling to get rid of fugitive criminals of other states. They therefore suggest that the treaty system be given up, and that statutory power be given to the proper authorities to deliver up fugitive criminals whose surrender is asked for, irrespective of the existence of any treaty on the subject. Inasmuch, however, "as treaties may sometimes be necessary by the laws or constitutions of foreign states to enable effect to be given to conditions" on which the English Government may properly insist, and for other reasons, it is suggested that this statutory power shall extend only to the cases of those foreign countries to which the crown may, from time to time, declare it to apply. In most of the existing English treaties a stipulation is contained prohibiting the surrender of a fugitive criminal if a subject of the state in which he is found, in respect of a crime committed in the other state. This the Commission think unnecessary and inexpedient, for the reason that extradition is based on mutual confidence, and there is no more cause for distrust of the fair administration of justice in such a case than in any other. It is further recommended that extradition should embrace "all those offences which it is the common interest of all nations to suppress; that is to say, offences against person and property, including in the latter category cases of fraud the purpose of which is to obtain property or money, offences against the bankrupt laws, "forgery and offences relating to the coinage" (making no distinction between felonies and misdemeanors), but excluding entirely "offences of a political *or local* character," such as "laws relating to military or naval service, laws relating to religion, laws relating to the duties of public officers, police regulations, and the like."

Mr. Welsh remarks in his letter that this report takes the view favored by the State Department, and we have no doubt that this is true, now that Mr. Evarts is at its head. That it favors what was known as the American view of the subject during Mr. Fish's *régime* it is a total mistake to suppose. That view was that, under an extradition treaty, you could extradite a criminal for one offence and try him for a totally different one. We pointed out at the time in these columns that this view was incorrect, because it involved the danger that a man might be tried not only for a political but for a local offence, and that this was a substantial injustice, inasmuch as many countries pass laws of a local character, laws on the subject of religion, etc., which provide for the severe punishment of offences not recognized by other countries to be serious offences, or perhaps offences at all. An instance of this would be our own revenue laws, which impose serious penalties for offences in Great Britain regarded as trifling. Now, the British Commission propose to provide against this question arising by excluding these cases from extradition altogether. Further than this, they express the opinion that if "some offence unknown to . . . what may figuratively be called the common law of nations should be created by the laws of a particular people, such an offence would not come within the category of crimes which it is the purpose of extradition to repress." They add that, to find out whether an offence is extraditable, resort must be had to English law, that "being abundantly comprehensive." Finally, on the question whether a person surrendered for one offence can be tried for another, the Commission see no reason why, "political and local offences being excepted," he should not. This exception, of course, removes every possible objection; and we presume that, if these recommendations are carried out, the practical result would be that in such a case as that of Winslow, if it clearly came within the exception and we persisted in trying it, an order in council would be made, bringing extradition between Great Britain and the United States to an end. If this is the American view, we are very glad of it, for it is undoubtedly as sound and sensible as anything American can be desired to be.

As between the United States and foreign nations there never has been really any reason for a dispute, as the perfect satisfaction expressed at the conclusions of this report shows. A great deal of the controversy which was carried on between this Government and that of Great Britain two years ago was based upon a confusion caused by the use of the term "right of asylum." These words in the popular mind, no doubt, signify a supposed "right" of a fugitive from *political* persecution to be sheltered from pursuit, and in this view political offences would seem to be the only ones out of which the right could grow. It would follow from this that so long as no attempt was made to infringe this right the fugitive could raise no objection to being tried for an offence different from that for which he had been surrendered. But the fact is that there is no such "right" as the "right of asylum." In law a *right* cannot exist without what lawyers call a *sanction* to enforce it, and a corresponding duty in some one else to recognize it. Now, no fugitive can enforce the right of asylum anywhere. If the British Government, or our own, undertook to abrogate it, and were to make it suddenly a practice to surrender fugitives charged with political offences, although it would be rightly considered an outrage, no one would have any redress. As an individual the fugitive could not establish his right. The Government which demanded his surrender would certainly not undertake to establish it for him, and no other country would have any ground of interference on the general principles of international law. The fact is that the "right of asylum" is a privilege accorded by the nations which recognize it, and though it is generally granted only in cases of political offences, the reason on which it is founded—the recognition of the justice of protecting fugitives from persecutions for acts *not regarded as criminal* in the country of refuge, or generally by mankind—applies, precisely as the English Commission declare, to all cases of a *local* character. It follows from this necessarily that if a fugitive is surrendered for one offence and tried for another, although it may be perfectly true that the court of his own country in which he is brought up for trial may not be at liberty to enquire into the question, the surrendering Government may have a good cause of complaint on the grounds just suggested.

On the whole, the discussion over extradition as between sovereign governments would seem to have left the matter in a very satisfactory state. We wish that as much could be said with regard to extradition within the limits of the United States—we mean between the States of the Union. It is a remarkable fact, brought to

light in a startling manner in the hearing before Governor Rice, of Massachusetts, on the application for the extradition of Kimpton by Governor Hampton, of South Carolina, that, although the Constitution expressly provides for the extradition of all criminals in the most general terms, a State governor may if he pleases set the provision entirely at naught, and by a judicious exercise of executive discretion convert his State into a regular felons' asylum. In the Kimpton case the real legal ground of the refusal to surrender was concealed from view by the reasons advanced for the refusal. In fact, Mr. Rice obtained a good deal of sympathy and approval in some quarters because he was shrewd enough to insist that his examination of the case had satisfied him that the demand for surrender was not made in good faith, and that the motive of the demand was to further a political persecution. But the *ground* on which he was advised that he could take that position was that he had absolute, unlimited, and arbitrary power to surrender or not surrender as he pleased. And this is unquestionably true. The Constitution (Article iv., sec. 2) does, indeed, provide in the most positive language that a fugitive from justice in any State, charged with "treason, felony, or other crime," and found in another State, "shall, on demand of the executive authority of the State from which he fled, be delivered up to be removed to the State having jurisdiction of the crime"; and the laws of the United States provide ('Revised Statutes,' sec. 5,278) that in case of a demand from one State executive upon another under this clause, and the production of a copy of the indictment or a proper affidavit duly certified, "it shall be the duty of" the executive upon whom the demand is made to cause the fugitive "to be arrested and secured," to cause notice of the arrest to be given to the other executive or his agent, "and to cause the fugitive to be delivered to such agent when he shall appear." Not a word is said as to reasons for not delivering. He is to be delivered in any case. Further than this, it has been decided by the Supreme Court of the United States, in the case of a suit brought by the State of Kentucky against the governor of Ohio (24 Howard, 66), that the "duty" imposed by this statute was an absolute ministerial duty; that the governor upon whom the demand was made had no discretion whatever to examine into the merits of the case; but that, on a proper demand being made, he must surrender the fugitive, just as any sheriff or marshal must arrest a man against whom he has a warrant.

Nevertheless, owing to the peculiar condition of the law on this subject, there is no punishment provided for a refusal to surrender; and so, in the case just referred to, when the governor of Ohio refused to surrender the fugitives, the court held, against its inclination, that it could not compel the performance of his duty. And this was precisely the foundation of Governor Rice's refusal in the Kimpton case—a knowledge that he could not be punished. This is what he terms the "discretion" vested in him. It is precisely the same sort of discretion that any criminal has to commit an offence to which the laws have annexed no penalty.

And this brings us to the important question whether there is any means by which this abnormal and scandalous state of things can be brought to an end. As the Supreme Court said in the case just referred to, "It would seem that when the Constitution was framed, and when this law was passed, it was confidently believed that a sense of justice and of mutual interest would ensure a faithful execution of this Constitutional provision by the executive of every State, for every State has an equal interest in the execution of a compact absolutely essential to their peace and well-being in their internal concerns, as well as members of the Union." But if governors can exercise a "discretion" of this sort, and there is no way of preventing it, it will certainly not be very long before the exercise of it ripens into a common practice, and we shall present to the world the grotesque spectacle of a country which in its dealings with foreign nations limits the "right of asylum" to the fewest possible cases, and in its internal concerns recognizes the right of some forty local politicians, most of them too undistinguished to make their love of reputation a guarantee of any value, turning their States into asylums for any criminal who can bring sufficient "pressure" to bear to get a hearing. It must not be forgotten, either, that the connection between crime and politics is in the United States closer than it would be in an ideal community, and it is no uncommon thing for gentlemen of considerable prominence to be engaged in both pursuits at once. It does not require any great stretch of fancy to imagine a state of things, say in Tweed's time, when executive "discretion" in cases of this kind would play very much the same part in encouraging crime that executive "clemency" is believed to have done in States whose governors have refused to issue death-warrants because they were opposed to hanging.

A curious case has just occurred in Illinois, in which Governor Cullom has refused to surrender two Pennsylvania criminals who removed to Illinois some years ago. These fugitives, who appear to have a strong sense of humor, say in their petition that immediately after the "affair" to which "the indictment refers," which is alleged to have been a brutal murder in a bar-room, but which they describe as one of "a mere private and personal character," they removed to Illinois, where they have since been living as peaceable citizens and have been forming "a large circle of acquaintances." On this the governor refused to surrender the two petitioners. It is obvious that this is practically the exercise of a pardoning power by the governor of one State for offences committed in another, and that, too, on an *ex-parte* statement of the criminals themselves.

The provision of some efficacious means of securing inter-State extradition has never been seriously considered by Congress, and the opinion has been expressed by the Supreme Court that it is not within the power of Congress to force a State officer to perform the duty. But there is one way of getting over the difficulty to which there seems no objection, and that is by referring the whole matter to the courts. There is nothing in the Constitutional provision quoted above requiring the demand to be made upon the governor of the State, and the only reason why the law refers to the governor at all is that this was the practice under the Confederation, when extradition was almost what it is now between sovereign governments, and the governor stood in the place of the ruler of a foreign country. But this is not the case now, and the United States exercise authority for many purposes within the limits of the several States. There seems no reason why in extradition cases, whenever there is a controversy as to the right to demand the surrender, this question should not be heard and decided by courts of the United States. Such a controversy is certainly one which seems to come within two or three classes mentioned in the Constitution as embraced under the judicial power of the general Government—*i.e.*, cases "arising under" the Constitution itself, under "the laws of the United States," and "controversies between two or more States."

GENESIS AND HISTORY OF "A STORY."

[*Letter of Z. L. W., dated Orangeburg, S. C., Nov. 23, in Tribune, Nov. 29, 1878.*]

"I HAVE heard many interesting incidents of the late election in this county *illustrative of the means to which the Democrats resorted to win their so-called victory. I shall give only one or two of them.* The Rev. Dr. Cooke, of Massachusetts, is the president of the Claflin University for colored people. I was informed by a Democrat before I had been an hour in town that the Doctor voted the Democratic ticket openly, and that he was a very popular man among the people here. *Upon enquiry I learned* that in 1876, at the time of Governor Hampton's inauguration, Dr. Cooke came from Columbia to Orangeburg one night on a train with a gang of roughs who had been to the capital to take part in the 'fun at the fair.' Recognizing him as a Northern man, a Republican, and the president of an institution for colored people, these chivalrous young men gathered around him, insulted him in the most outrageous manner, called him all sorts of vile names, hustled him about, and kept him in mortal terror for three hours. The fright actually made him sick, and I have been told that he subsequently wrote an account of the affair to a Northern religious newspaper, in which he declared that he believed his life to have been in danger. This year he rode to the polls in the wagon provided by the Democrats to bring in aged and infirm voters, and openly cast a Democratic ballot. *The Republicans here would be glad to know if he was converted by the Bulldozers in* 1876."

In reply to the foregoing, in which the italics are our own, Dr. Cooke wrote in the *Tribune* of Dec. 21, 1878:

"In your paper of November 29 your able correspondent from this State introduces my name in connection with the political excitements of

the day. I cannot conceive how a paragraph of the same length could possibly be written containing more misstatements and false coloring than the one in question. I do not hold the writer responsible so much as his informant, who evidently wished to hold me up in as ridiculous a light as possible before the Northern people. Not one true or fair statement is contained in the paragraph which relates to myself.

"I have been a Republican at the North ever since the party was organized, and am so still. But I can't say I am willing to claim political fraternity with the most claiming to be such whom I have met in South Carolina. True, I voted for Wade Hampton at the late election, without waiting to ride to the polls 'in a wagon provided by the Democrats to bring in aged and infirm voters.' *I have never been bulldozed into any change of political opinion. My action was based upon good and satisfactory reasons:*

"1. *I believe in home government everywhere, if a good government can be secured.*

"2. *There was no opposing candidate to Governor Hampton.*

"3. After watching his course carefully for two years, I fully believe he is a true friend of the colored man, and is doing vastly more for his elevation in this Commonwealth than any Northern man could under a bayonet rule. I need only point to the improved common schools and increased facilities for his intellectual training in proof of this assertion.

"Your correspondent would, it seems to me, do well to get at the true facts rather than become the organ of private grievances."

Z. L. W. replied to this (*Tribune*, Nov. 29) that he had the story about the wagon from "four different persons," "gentlemen of high character," but "whose names" (as usual in these cases) "he does not feel at liberty to publish." He "still believed, after reading Dr. Cooke's letter, that he was carried to the polls on election day by some of his Democratic friends." The other story, about the popularity, he had from "the hotel-keeper in the village," and "the story about the insults and abuse" he had from "an eye-witness" and from "another South Carolina gentleman who happened to be on the same train." He has no evidence whatever, however, on the essential point in his first "story" —*i.e.*, the relation of cause and effect between Dr. Cooke's being insulted in a train in 1876 and his voting the Democratic ticket in 1878, and which Dr. Cooke denies.

On the matter in this stage the *Nation* thus commented (January 2, 1878):

"The newspapers which have been giving publicity to the grievances that respectable Republicans at the South have suffered at the hands of the Democracy seem to have performed an ungrateful task. Some of the persecuted ones disclaim the crown of martyrdom which is thrust upon them, and flatly deny the accounts of terrorism which correspondents have been at such pains to collect. Among those who decline to be the objects of what they consider a misplaced sympathy is the Rev. Dr. Cooke, the president of Claflin University for colored people, of South Carolina. The *Tribune* of November 29 contained an account of intimidation at the South in which it was asserted that Dr. Cooke had been carried to the polls this year in a wagon used by the Democrats to bring in aged and infirm voters, and that he had openly voted the Democratic ticket. The writer said that this painful sight was the result of dreadful ill-treatment which Dr. Cooke had received at the hands of roughs on a railway train at the time of Governor Hampton's election in 1876, which treatment had frightened him into complete submission to Democratic wishes. Dr. Cooke writes to the *Tribune* that 'not one true or fair statement is contained in the paragraph relating to himself.' He denies explicitly that his political action has ever been influenced by intimidation, and adds that, although a Republican himself, he claims no political fraternity with many Republicans in the South. His vote was cast on good and satisfactory grounds, especially because, after watching Governor Hampton's course for two years, he believes that he is a 'true friend of the colored man, and is doing vastly more for his elevation in this commonwealth [South Carolina] than any Northern man could under bayonet rule.' Dr. Cooke adds that he 'need only point to the improved common schools and the increased facilities for the negro's intellectual training in proof of this assertion.'

"The *Tribune* correspondent replies by a reference to the 'high character' of his informants, but, apparently feeling shaken in regard to the grievances of Dr. Cooke, he puts his best talent into corroborating the story about the Democratic wagon for the aged and infirm. *This incident is supported by the testimony of one Democrat and three Republicans, whose names he sends the editor privately, but does not feel at liberty to publish.* And so the wretched fight is kept up."

The *Tribune*, in its issue of January 3, then spoke as below (the italics again are ours, and they refer to other italics in the foregoing extracts). The allusion to "disingenuousness" is not bad, after the suppression of the fact that the correspondent gave Dr. Cooke's case, as described by himself, as "an illustration of the means to which the Democrats resorted to win their so-called victory":

"The Rev. Dr. E. Cooke, President of Claflin University, in South Carolina, seems to be a swift witness. The *Tribune's* correspondent, 'Z. L. W.,' in his letter published November 29, mentioned the fact that he voted the Democratic ticket openly at the late election, and in connection with that circumstance, after relating a story, which was certainly current in South Carolina at the time, concerning the treatment the reverend gentleman received at the hands of the chivalry in 1876, said: 'The Republicans here would be glad to know if he was converted by the Bulldozers in 1876.' Our contemporary, the *Nation, will no doubt be glad to correct its statement* that 'the writer said that this painful sight was the result of dreadful ill-treatment which Dr. Cooke had received at the hands of roughs on a railway train at the time of Governor Hampton's election in 1876, which treatment had frightened him into complete submission to Democratic wishes.' We have great admiration for the candor and independence of our contemporary, but in this case its desire to divest itself of all prejudice against our Southern brethren *has tinged its gentle sarcasm with exaggeration.* The *Tribune's* correspondent simply related what was currently reported, and made the comment above quoted. The reverend gentleman subsequently, in a letter to the *Tribune, denied the truth of the report*, and our contemporary, in its zeal for truth, hastens to inform its readers that he 'denies explicitly that his political action has ever been influenced by intimidation, and adds that, although a Republican himself, he claims no political fraternity with many Republicans in the South.' *It was an oversight, perhaps, that our contemporary neglected to mention that our correspondent gave his authority for the report*, and referred to the testimony of an eye-witness of the occurrences described in corroboration of their truth. *In any other than an independent newspaper the classing of the Rev. Dr. Cooke, upon the strength of what the Tribune's correspondent said of him*, among 'the persecuted ones' 'who disclaim the crown of martyrdom which is thrust upon them, and flatly deny the accounts of terrorism which correspondents have been at such pains to collect,' might *be considered disingenuous.* The facts hardly warrant the inference that the *Tribune* awarded him 'the crown of martyrdom,' or made him an 'object of misplaced sympathy.'"

We again repeat that this exposure does not prove that there was no violence or fraud at the late election in South Carolina, but it does illustrate the recklessness and unscrupulousness with which Southern troubles are distorted, colored, and exaggerated to make party capital at the North. It is a miserable business, and the *Tribune* ought to be ashamed of it and drop it. The contention with Dr. Cooke as to whether the hustling he got from some rowdies in 1876 did not make him change his vote two years later, is as comic as anything in recent political literature. What caused the correspondent to take the trouble to prepare "the story" undoubtedly was the firm possession of his mind by the theory, which lay at the bottom of Mr. Blaine's speech in the Senate, that not only every negro, but every white man engaged in the instruction of negro youth, must, in the absence of duress, desire to vote the Republican ticket even in South Carolina; and that when he says he does not desire to vote it, he is not to be believed even on oath, and his person ought to be examined for welts and bruises.

THE PROPOSED REFORM IN OUR LAND AND SCIENTIFIC SURVEYS.

DURING the last ten years four distinct autonomous geographical and geological surveys, besides the Coast and Geodetic Survey and the sixteen virtually independent surveys now connected with the Land Office, have been conducted simultaneously. This is obviously illogical, unscientific, and clumsy. Naturally the results in detail are found to be of limited value for the more important national purposes. The original determinations by these several surveys have been without agreement, their objects diverse, their mode of operation discordant; their productions are sometimes contradictory, and often have occasioned needless cost by duplication or overlapping, and also by undue, or at least premature, attention to particular localities. The operations of the special surveys under the War and Interior Departments have not generally been and were not designed to be useful for the parcelling of land; the work of the Coast and Geodetic Survey in the interior neither includes that object nor topography; and the land surveys proper, while of the slightest topographical and geographical, and of no geological, value, have been conducted in an antiquated and costly method shown by experience to be inadequate to the very purpose of their establishment.

This disgraceful and senseless confusion has been occasioned by the stinted range given to the several organizations, as Congress was at various times persuaded of their propriety. The land surveys were devised nearly a century ago to meet the simplest needs of sale and settlement, and have not been modified to conform with improvements in mensuration and wholly changed conditions. The Coast and Geodetic Survey was instituted merely for the wants of commerce, to which the systematic triangulation it now conducts at several points in the interior is but incidental. The special geographical and geological surveys owe their origin to the laudable ambition of several gentlemen who from time to time pressed the claims of those branches of science, and exhibited such real or (in some cases) specious results in certain directions of their yearly labors as to receive continuance of temporary appropriations. Of late

years, however, the vicious terms of their separate existence on mere annual sufferance have produced an unhealthy competition for public favor, taking sometimes the ignoble form of contention in the presentation of photographs to members of Congress, and a show of multiplied thick volumes more or less irrelevant to the duties imposed, but seeming to legislators regardless of that criterion, or who never opened them, proof of vast energy and erudition. Instead of original contributions to knowledge there has appeared reliance on membership in many learned societies, easily obtained in exchange for cart-loads of publications not written by the owner of the name on their title-pages and in the diplomas. Vanity, greed, and malice were also developed in the struggle, resulting in schemes for individual supremacy in and monopoly of all scientific work connected with, or by any stretch of implication to be included in, the broad field of territorial exploration. This necessarily induced resistance, recrimination, and mutual exposure.

Near the close of the last Congress the Appropriation Committee of the House of Representatives, not only wearied by complaints and assumptions, but recognizing the impossibility of obtaining conscientious work with the minimum of expense from internecine rivals without permanent status, who could misapply public funds for self-advertisement and factitious reputation, announced that no more appropriations would be reported for any of the surveys in question, until some judicious system of consolidation under proper direction should be adopted. At the last session further examination was made by the same committee with the result that its members, not being able from their own information to decide upon the conflicting claims, while reiterating their decision to make no future appropriations, took a second and most judicious step. By a clause in the act making appropriations for the sundry civil expenses they enlarged the scope of enquiry to include the surveys of the Land Office, together with those of a scientific character under the War and Interior Departments, and referred the whole subject of surveying and mapping the territories of the United States to the highest scientific authority in the country—the National Academy of Sciences—for report upon a general system to secure the best results at the least possible cost.

The report of the Academy, just published, touches upon several of the points above mentioned, but lays special stress upon the dominant necessity for the present and near future—viz., the proper survey and classification of what remains of the public domain, so as to meet the wants of settlers and the requirements of Government. And here it seems proper to examine into the present mode of survey under the Land Office. The objects of that organization were primarily to parcel the lands so that titles to definite portions might be conveyed from the United States to individuals, and, secondarily, that the value and characteristics of the land might be ascertained. Neither of these ends has been well attained, from the fact that there was never a proper scientific supervision. Instead of having a single, responsible head, the surveys have been managed by a multiplicity of local surveyors-general, now sixteen, practically autonomous, who do not themselves conduct the actual surveys, and are not even selected as experts to supervise them, but are appointed, when not solely for political influence, for legal and administrative ability. They are law officers intermediate between the General Land Office and the deputy surveyors who do the work. That is done by contract and often sub-let, so that a large number of persons are annually employed, each one adopting his own mode of operations, only conforming to certain general regulations. Latitudes, longitudes, altitudes, and topographical positions have been neither absolutely nor relatively established with any accuracy, the personal interests of the surveyors under the contracts being opposed to accurate and scientific detail. The cartographic methods have been so diverse and imperfect that no general map of value can be constructed from the immense number of township maps filed in the Land Office. The surveys have proceeded by north and south and east and west lines, without scientific checks for their extension, from a number of initial points the geographical co-ordinates of which were not determined. When the surveys met it was found that no two systems could be made to agree, and connections were forced by irregular fractional subdivisions. Corners were marked by wooden stakes, when such were easily found, to decay as easily, or by small heaps of raked-up earth, to wash away in rains. In timber districts the lines were further marked by blazing adjacent trees, which often were destroyed. All such expedients are unavailing when no thorough topographic system is adopted, and the charts became practically valueless. These charts furnish a monumental example of ill-directed work. The Land Office is encumbered with more than thirty-five thousand manuscript maps of elaborate construction, costing more than twenty-three millions of dollars, and supposed to represent the topographic features of more than one million one hundred thousand square miles of territory. They are of little worth for economic considerations, of absolutely none for scientific uses, and are so imperfect for parcelling that endless litigation relating to boundary lines has grown out of them and must increase with the value of land. In the mineral districts now worked this already appears as a great evil, and the futile records are supplied when possible by parole evidence, to the proverbial encouragement of perjury.

All useful purposes can be attained by a triangulation extended from a system of base-lines accurately measured, with positions determined; from points in these all the lines of the parcelling surveys can be checked. Such a system of primary triangulation would not only remedy the chief defects in the survey of the public lands, but would secure economy, rendering much of the present work unnecessary and distributing the cost of the remainder over years in a manner the least burdensome. The land remaining to be surveyed and sold amounts to 1,101,107,183 acres, but the small proportion of it now attractive to settlement has tended to plant population in scattered districts where water can be found, and those districts are separated by mountains and expanses of barren plains. To survey the desirable districts by present methods it is necessary to run lines from standard meridians and parallels or from established township corners; and those lines must be marked and measured before the contractor can receive his pay. To connect isolated districts through a series of township corners is a needless expense; to mark the corners by perishable devices wherever they may chance to fall in the mountains is futile, and the inaccuracy in a difficult country is apparent. A proper triangulation would dispense with much unnecessary work which the contractor now finds it in his interest to perform. Having great discretion in the selection of districts to be surveyed, he chooses those requiring least cost to himself without regard to their speedy or probable occupation. Thus millions of worthless acres have been parcelled to no advantage. The difficulty and cost of the present mode of survey in the Far West will be much greater than where heretofore employed, while on the other hand geographical work can be more readily performed there from the absence of timber, the abundant salient points for triangulation, and the numerous elevations commanding intervening valleys. The work of the geologist can also be there conducted with unusual speed and economy on account of the general aridity and consequent destitution of vegetation and soil. From these considerations it is probable that all necessary surveys can, under a proper method, be completed for the cost that would be incurred for the land-parcelling surveys alone.

It will be admitted that for any intelligent administration of the public domain a thorough knowledge of its geologic structure, natural resources and products, is indispensable. Existing laws require also classification in the interest of the Government. The statutes designate for disposal in different modes and at several prices the classes of—1st, Agricultural; 2d, Swamp; 3d, Desert, or lands only valuable for agriculture through irrigation; 4th, Timber; 5th, Live-Oak and Cedar; 6th, Mineral Vein; 7th, Placer; and 8th, Coal Lands. While all these classes are supposed to be determined, no adequate provision is made therefor, and the laws are inoperative or readily evaded. Coal lands, for instance, salable at ten or twenty dollars per acre, are usually obtained by purchase at $1 25 per acre, or by homestead and pre-emption entry. The hypsometric methods now employed by the several surveys are inadequate to meet the practical wants of the arid region, embracing more than four-tenths of the whole area of the United States, where agriculture, when possible, is dependent upon irrigation. In all of this region the relative levels of the land to the adjacent streams by which they are to be fertilized must be determined before parcelling and sale. The necessity for this work, with new farm units and an improved mode of distribution, to render available the remaining portions of our public lands, has been before explained in these columns (*Nation*, No. 670).

The Academy recommends the discontinuance, first, of the present geographical survey west of the 100th Meridian under the War Department, except surveys necessary for military purposes and local internal improvements; second, of the geographical and geological surveys under the Department of the Interior; and third, of the present surveys under the Land Office. In place of these conflicting and imperfect organizations, it urges, first, that the Coast and Geodetic Survey, retaining its original field of operations, should assume also the entire mensuration of the public domain, and comprise, together with land-parcelling surveys, detailed topographic work and rapid reconnoissances; and that this survey, hitherto without controlling reason connected with the Treasury Department, should, in view of the paramount importance of the public

lands, the disposition of which is necessarily in the Department of the Interior, be placed under the latter with the designation of Coast and Interior Survey; second, that an independent organization, to be known as the Geological Survey, should be charged with the study of the geologic structure and economic resources of the public domain, to be placed under a director appointed by the President and reporting directly to the Secretary of the Interior. The Land Office remains in the same department, controlling the disposition and sale of land, including all questions of title and record, calling upon the Coast and Interior Survey for all surveys and measurements required, and upon the Geological Survey for all information as to classification.

No opposition prompted by good motives or supported by solid reasons can be offered to these admirable recommendations. Any objections from the Engineer Corps of the Army will, we are persuaded, give way on reflection to considerations of the public good. No chief of the civilian surveys will be likely to declare himself indispensable, and his pet plan the embodiment by patent right of all science. Delay in the remedial legislation is more to be apprehended from the sixteen surveyors-general, their deputies, and sub-contractors, whose business and perhaps "jobs" will be interfered with. These officers, being political appointees, all have friends or relatives in Congress, and will doubtless organize a lobby to defeat reform, but it is not probable that their interested efforts will prevail against obvious economy and common sense.

'LES MIRABEAU.'—I.

PARIS, December 13, 1878.

M. DE LOMÉNIE is well known in the literary world by his 'Beaumarchais et son temps.' He had chosen the eighteenth century as his special department, and he only studied its curious literature; he tried to find the causes of the terrible Revolution which ended it. M. de Loménie was a man of the world; he took a deep interest in politics; he had, in his youth, enjoyed the friendship of Madame Récamier at the Abbaye aux Bois; he had known Chateaubriand; he had become the most intimate friend of Ampère and of Tocqueville. He felt at times inclined to enter into political life, but he had none of the vices which assure the success of a man, if I may borrow this expression, which was sometimes used by the late Lord Clarendon. He belonged to an old, aristocratic family, but he had very little fortune, and he was obliged to accept two professorships—one at the Polytechnic School, the other at the Collège de France—in order to educate his family. As he was very conscientious, these functions deprived him almost of all liberty, and it was under great difficulties that he published his studies upon the family of Mirabeau.

Mirabeau was the great figure of the French Revolution; he belonged to the past, and he hurled France into the abyss of revolution. M. de Loménie had met, when he was still young, the adopted son of Mirabeau, M. Lucas de Montigny, whom he describes as a most kindly and excellent man. M. Lucas de Montigny had an immense amount of documents concerning Mirabeau and his family. He himself had used some of these documents, and published a work which he entitled 'Memoirs of Mirabeau,' though the great orator did not write these Memoirs. M. de Loménie, who was a real critic, soon perceived that M. Lucas de Montigny had neglected many important parts in the family papers of Mirabeau. He undertook to bring back to life not only the great Mirabeau, but all the members of his family, especially his father, the Marquis, and his mother, the Marquise, and his uncle, the Bailli. Mirabeau once said that the Mirabeaus were the "family of Atreus and Thyestes." All is now forgotten of the terrible quarrels of the Marquis of Mirabeau with his son, his wife, and even his daughter; the scandals of his son's life are forgotten also, and have died in the halo of his Revolutionary glory. Donoso Cortés, the great Spanish orator, once spoke of the Revolution as of a woman walking, like the ancient furies, with her head covered with serpents; the Revolution would be better compared to a magician who can turn everything into gold, and every servant into a saint or a hero. But "scripta manent," and M. de Loménie was determined to show to the world the real Mirabeau.

The two volumes which have now been published represent only half the work of M. de Loménie. He could not finish his task; he has left even the two volumes which are given to the public in an unfinished state, and Madame de Loménie has been obliged to fill some parts with the notes left by her husband. Such as they are, they show us all the members of the family of Mirabeau, but Mirabeau himself does not yet appear—at least he does not yet fill the stage. It is "Hamlet" without *Hamlet;* but the reader will not be disappointed if, looking only for a study of the manners of the end of the eighteenth century, he wishes to live in imagination at the eve of the great Revolution. He will, besides, have all the pleasures of a drama, for the Mirabeaus are a dramatic family; they seem to be the remnants of the feudal ages; they have a turbulence, a violence, a degree of passion which is not often found among the contemporaries of Voltaire. There is some harmony between nature and man. The Mirabeaus belong to the higher districts of Provence. If you go from Pertuis to Manosque you see before you, behind the black mountains of the Luberon, the chain of the Alps. Not far from Pertuis, on a rock between two narrow gorges, stands the château of Mirabeau, with its four high towers. Before the Revolution it had two towers more; after that terrible period it was deserted, became the refuge of wild beasts, and was used by all the peasants of Manosque as a quarry, till it was sold to a peasant for a ridiculous price. In 1815 it was bought back from this peasant for the sum of five hundred francs, by a gentleman who had been educated by the great Mirabeau till he was nine years old, and to whom Mirabeau had made a legacy in these terms: "I leave to the son of Lucas de Montigny, sculptor, known under the name of the *petit Coco*, the sum of 24,000 livres, which will be invested to his profit by the care of my friend La Marck." The little Coco had become an administrator under the Empire, and remained some time at Marseilles; he had the curiosity to see the ancestral seat of the Mirabeaus, and, as I said, he bought it for five hundred francs. The castle is now inhabited by his son, who has restored it as much as possible. The Marquis de Mirabeau, the father of the orator, describes the higher Provence in these terms: "Burning sun, excessive climate, savage aspect, rocks, birds of prey, devouring rivers, torrents either dry or overflowing; the men hard, strong, outspoken, and uneasy." This word "excessive," which he applies to the climate of Provence, well describes all the Mirabeaus.

The Mirabeaus were first known under the name of Riqueti; they only bought the castle of Mirabeau in 1570. M. de Loménie proves conclusively that the Riqueti were not a noble Florentine family, as is often alleged; they were merchants, who established manufactures at Marseilles. When they were rich enough to buy Mirabeau they received it from the family of Barras, which had for its device: "Li Barras viei coumo li roucas" (The Barras as old as the rocks). The real name of the Riqueti was probably Riquet, but it was the fashion in Provence to give names an Italian termination: it was less *roturier* to be Riqueti than Riquet. I cannot even analyze all that M. de Loménie has to say of the eldest Mirabeau, and come at once to his grandmother, Françoise de Castellane, whom he describes as one of the handsomest persons of her time. She lost her husband early and had the care of three sons—the Marquis (the father of the orator), the Bailiff, and the Count. She had a strong will and she inspired her sons with as much deference as affection. She was austere, pious, and very methodical. The Marquis probably learned from her those theories of parental authority which he vainly tried to enforce upon the great Mirabeau. Poor woman! she was passionately fond of the Marquis, her son; he was also very devoted to her. She was sixty years old when he decided her to leave her château in Provence; he married in Paris while she was still in Provence. This very unfortunate marriage became a source of trouble for the whole family. Françoise de Castellane had not only the sorrow of seeing her son ill-married; she saw him afterwards admit into his house a mistress, Madame de Pailly. She was very devout, but she finally lost her reason and she lived in a state of madness till the age of eighty-six years. (You may find all the details of this painful case in the 'Memoirs' of Baron Gleichen, ambassador of Denmark in Paris.) She lost her mind in 1766 and died in 1769.

The Count, who was the youngest of the three sons of Françoise de Castellane, died at the age of thirty-six, and has left no name. The Chevalier, who was the second son, and who afterwards took the name of Bailiff when he became grand-cross of the Order of Malta, is a very interesting character. The orator, when he wrote his Letters in the prison of Vincennes, said of him: "I love and revere my uncle: my uncle has the soul and the virtues of a hero." Mirabeau wrote these lines when he was at war with all his family—with his father, his sister, and even with his mother. The Bailiff has not the celebrity of his brother, who was called *L'Ami des hommes;* he has not the reputation of his nephew, but he is evidently the favorite of M. de Loménie:

"He is," he says, "the finest moral product of this impetuous and often unbridled race. But as if excess, even in good, was inherent to it, the best of all was excessive in his passion for truth and for justice. The Bailli de Mirabeau was an Alceste [*Alceste* is the misanthrope of

Molière], and a feudal Alceste ; his physiognomy comes out in strong features amidst the frivolous faces of the eighteenth century ; but he had nothing in common with the hero of Molière except this exaggeration of frankness and of rigorism. He was not accessible to the domination of a *Célimène ;* he did not content himself with declamations against the vices of humanity ; he fulfilled all the duties of a laborious career and was more occupied in doing good than in criticising evil."

He was for many years a sailor, and at one time there was a question of making him Minister of the Navy ; but in the eighteenth century, and perhaps at other times, a little more diplomacy than the Bailiff possessed was required for this post. He was for a time Governor of Guadeloupe. He wrote a number of memoirs on technical subjects, which are now quite forgotten. His early education had been somewhat neglected ; at nineteen this young man who afterwards became so austere was as wild as only a Mirabeau could be.

"I have seen," writes his brother the Marquis in 1770, "the youth of the Bailli, who, during three or four years, was not for more than a week at a time out of prison, and as soon as he saw the light of the day lost himself in brandy, and then fell on anybody whom he met, till he was borne to prison. With all that, he was full of honor, and his superiors always promised my mother that he would become an excellent officer. However, nobody could stop him till he suddenly stopped himself."

This period of folly was short. The young Chevalier was then at Malta, and Malta is perhaps not a very intellectual place. It was then full of young men of good family who had not much to do. After his service at Malta he entered the navy, but I will not give an account of his long journeys and of his campaigns. On the high seas or in distant lands he preserved always in his heart two noble sentiments : he was passionately attached to his mother and to his brother the Marquis, whom he considered a great man. He was the cadet, and the Marquis had all the privileges ; but the Chevalier had but one thought—the glory of the name of Mirabeau—and he was absolutely disinterested in all money transactions and arrangements. He was very economical, while the Marquis was very disorderly ; he always considered his economies as a little family treasure. He leaves them in the hands of his brother, and when he has some need of money he seems almost ashamed to ask him for a small part of what is his own. On the other side, it must be said that the Marquis is ever ready to help his brother in his career, and is incessant in his praise. He consults him in every case ; he looks upon him as the best, almost the only real, friend he has in the world. He is very ambitious for his brother, and he forces him to accept the very expensive post of General of the Galleys of Malta. He incurs debts himself in order to procure this post for him ; he procures for him afterwards the richest *commanderie ;* in short, he finally makes his brother rich, and, by a strange turn of events, we shall see that he subsists in the end, when he is lost in his lawsuits with all his family, only on the little fortune which he has, so to speak, forced upon the Bailiff. The relations of these two brothers form perhaps one of the most curious chapters in the history of the right of primogeniture in France.

But it is time that I should arrive at the principal figure of the work of M. de Loménie, the Marquis, commonly called *L'Ami des hommes.*

Correspondence.

A NEW VOLUME OF THE 'FINAL PHILOSOPHY.'

To the Editor of The Nation :

Sir : The critic who noticed my treatise on the 'Final Philosophy' in your last number has expressed a solicitude in regard to the work which the author alone can relieve.

"The first essay," he says, "has been cordially received, if it has not been much read. May we not have some hope for the future ? Almost a score of years have been devoted to it by the author, he tells us, and a collegiate chair secured expressly for its support. What a loss it would be if it were to perish unwritten !"

Permit me to reply that the revised sheets of the second edition of the work have this morning been sent to the printer, and that the materials for another volume have long been accumulating, having in fact formed part of the college course to which the critic refers. When his desires for that volume are to be met, I could not now promise ; nor would it be easy to afford him even a foretaste so long as he holds his present estimate of "the Princeton curriculum," and, apparently, of "the productions of the American press."

Trusting that this brief note will not take up too much of your space, I am, very truly yours, Charles W. Shields.

Princeton, Jan. 2, 1879.

THE ABUSE OF THE PARDONING POWER.

To the Editor of The Nation :

Sir : The President has recently granted a pardon to one Heywood, who was convicted in Massachusetts for sending obscene matter through the United States mails, thus reducing his sentence from two years to seven months, and making himself morally responsible for all the mischief that this man will do during the interval for which the President has given him the opportunity.

The abuse of the pardoning power is an evil of constantly-increasing magnitude. It would be interesting to make a list of all the counterfeiters, liquor-swindlers, and defaulters who, after careful trials, difficult convictions, and moderate sentences, have been almost immediately let loose by Mr. Hayes, to recommence their preying upon society. There are many who think that in view of these enormous abuses, which extend to State as well as national executives, it would be far better to do away with the pardoning power altogether. At the very least, a pardon without the recommendation of the judge who conducted the trial should be made impossible, even for the President. M. C. L.

SHELLEY'S RELIGION.

To the Editor of The Nation:

Sir: In your paper for Dec. 26, in an article relative to Percy Bysshe Shelley, after stating that "Shelley rejected all that is properly known as Christianity, and that it is impossible to deny Shelley's atheism, and that he began life with a theory which imposed no restrictions except those of his own honor and self-respect, which acknowledged no command not proceeding from his own reason," you remark that "the most that can be contended for is that in all that constituted a religious mind, in natural piety, in purity of life and motive, Shelley was exceptionally conspicuous."

May I take the liberty of asking, in view of the fact that the *Nation* is probably read by many young men whose practical sentiments it doubtless does much in shaping, that you would explain how a mind in which the essential underlying principle of all religion, the being of God, is entirely disowned, and in which no obligation of obedience to any authority outside of itself was entertained, could yet be exceptionally conspicuous in all that constitutes a *religious* mind ? Are we justified in inferring from the article in question that Christianity, and even natural religion, may everywhere be entirely dispensed with, and yet every man's character and conduct be all which they ought to be? Nisus.

[The article in question attributes Shelley's sense of "freedom from obligation of obedience to any authority outside of himself" only to the earlier part of his short career. It says that he "began life with a theory which left every desire and impulse free course, etc.," but that "by intense thought and bitterest experience he came at last to find the laws of life and to obey them," so that he did not end his life as a lawless person. We admit, however, that it is perhaps a straining of the term "religious" to apply it to the mind of a person who does not believe in a personal Deity, but that it is not an unprecedented or wholly unwarranted use of it is shown by the language of Mr. F. W. Robertson about Shelley which we have quoted, and it may be still further justified and explained by the following from Hunt's account of the poet's death :

"His aspect had a certain seraphical character which would have suited a portrait of John the Baptist, or the angel whom Milton describes as holding a reed 'tipped with fire.' Nor would the most religious mind, had it known him, have objected to the comparison, for with all his scepticism Shelley's disposition was truly said to have been anything but irreligious. A person of much eminence for piety in our times has well observed that the greatest want of religious feeling is not to be found among the greatest infidels, but among those who never think of religion except as a matter of course. The leading feature of Shelley's character may be said to have been a natural piety. He was pious towards nature, towards his friends, towards the whole human race, towards the meanest insect of the forest. He did himself injustice with the public in using the popular name of the Supreme Being inconsiderately. He identified it solely with the most vulgar and tyrannical notions of a god made after the worst human fashion, and did not sufficiently reflect that it was often used by a juster devotion to express a sense of the great Mover of the universe. An impatience in contradicting worldly and pernicious notions of a supernatural power led his own aspirations to be mis-

construed; for though in the severity of his dialectics, and particularly in moments of despondency, he sometimes appeared most hopeless of what he most desired, and though he justly thought that a Divine Being would prefer the incense of benevolence and good before any praise or even recognition of himself (a reflection worth thinking of by the intolerant), yet there was in reality no belief to which he clung with more fondness than that of some great pervading 'Spirit of Intellectual Beauty,' as may be seen in his aspirations on the subject. He assented warmly to my opinion which I expressed in the cathedral at Pisa while the organ was playing, that a truly divine religion might yet be established if charity were really made the principle of it instead of faith."—Ed. Nation.]

HOW TO CIVILIZE THE INDIANS.

To the Editor of The Nation:

Sir: The *Nation*, No. 700, contains a letter from Mr. Lewis H. Morgan on the Indian question. It is very apparent that Mr. Morgan has given this subject a good deal of study. The conclusions which he has arrived at, as regards the present condition of the Indians and the natural stages by which they might be made to ascend in the scale of civilization, are correct. How any careful and candid student of the subject can arrive at any other conclusions is a mystery. The Indian is intelligent, and amenable to reason; but he has not the capacity, in his present barbarous condition, of retaining long a clear remembrance of the difference between right and wrong, nor has he the moral stamina to act, as he has been convinced it is right that he should, in opposition to his passions and the time-honored customs of his ancestors. Hence acting alone, unsupported by the actual presence of physical power, moral suasion utterly fails to effect any permanent elevation of the condition of the Indian. Talk to him like "a man and a brother," and he will readily admit the justness of your strictures upon his conduct: "My friend, you have shown me the straight road. I will henceforth follow it"; and straightway he goes meandering along the crooked paths his ancestors have made memorable.

What can be done? The answer is not difficult. Treat him as you would a child, justly and firmly, placing in the hand which furnishes food and protection actual, living, ever-present power to punish transgression. Take away from him his surplus ponies and firearms, forbid the sale or issue to him of paints and many-colored blankets; these serve only to stir up in his barbarous heart longings to emulate the bloody deeds of his barbarous ancestors. Issue to him domestic cattle and white man's clothing, assist him in caring for and *protecting* his stock. Invest the branch of the Government called upon to perform this duty with the necessary, tangible, and effective power to enforce obedience to moral suasion.

Under the moral-suasion policy four hundred domestic cows were given to the Indians at this agency, and the Indians ate them up, although every effort was made by the agent to persuade them not to do so. In October, 1877, four hundred and forty-nine cows and four bulls were given to the Indians at this agency by order of General Sheridan. They were purchased by military authorities from the proceeds of the sale of surrendered Indian ponies. By direction of the post-commander at Cheyenne Agency, D. T., these cows were turned over to the heads of families, who signed an agreement to care for and protect the said cows and their increase for the benefit of themselves and their families; further, they agreed that they would not kill, sell, trade, or otherwise dispose of them, and that they would submit to a retention of their rations for such time as the post-commander should deem just in the event of their violating any of the foregoing agreements; and, finally, that they would report to the said authority any violation of this agreement that might come to their knowledge. All this was read over to each Indian before he was required to sign the same. The post-commander then directed the officer in command of Indian scouts to keep a general supervision over the cows. Last July this officer made a careful and thorough inspection of all the cows, bulls, and calves, and found four hundred and forty-four cows, five bulls, and three hundred and fifty calves in the possession of the Indians, showing a loss of five cows and a gain of three hundred and fifty calves.

In September of this year two hundred cows and four bulls were turned over to the Indians at this agency, in the same manner as the previous lot. This stock was also purchased by the military authorities upon the proceeds of the sale of Indian ponies surrendered to said authorities last winter and spring. The Indians are taking excellent care of this stock; each family caring for them and protecting them, and intensely interested in their cows and calves. They have built warm, substantial stables, put up hay for the winter, and in every way shown an appreciation of the value of their stock. They have been assisted by the advice of the officers in charge, but have been required to do all the work. During the last summer nearly all the Indians at the agency made actual attempts to cultivate the ground and raise crops, and built about one hundred log-houses. Little-No-Heart, chief of the Minneconjou tribe, and "The Charger," chief of the Sans-Arc tribe, put in the hay required for the use of the agency during the present winter, and charged the Government four dollars less a ton than the white man did last year. Since April of the present year, when an army officer took charge of this agency, six full-blooded Indians have been permanently employed about the same as laborers, the Government paying them ten dollars a month for doing the same work it pays a white man forty dollars a month for doing. Two years ago the writer was frequently told by the agency officials then in charge that it would be impossible to get an Indian to work for any price, and that he would consider a proposition to do so as a mortal affront.

Is it difficult to understand why the Indians at this agency have made so much progress in the last two years, while their uncles, cousins, and other relations at Spotted-Tail and Red-Cloud Agency have made very little or none at all? It is due to actual and active support of moral suasion by physical force, combined with just and equitable treatment, and this I believe to be the only policy that will ever satisfactorily solve the Indian question.

I remain, sir, very respectfully your obedient servant,

Geo. Le R. Brown,
Second Lieutenant, Eleventh Infantry.

Cheyenne Agency, D. T., Dec 8, 1878.

OUR SOUTH AMERICAN TRADE.

To the Editor of The Nation:

Sir: In his recent memorandum concerning our South American trade Mr. Evarts says that our manufactured goods are now reaching South America *via* Europe, and he asserts that "no stronger demonstration of the tendency of commerce to follow in the train of postal communication can be conceived." We have no direct postal communication with South American ports, but have to send our letters by way of Europe. Mr. Evarts suggests, therefore, the subsidizing of mail steamers to run between the United States and South America.

Believing that trade is, in reality, but a barter of merchandise against merchandise, and that our tariff laws practically prohibit the importation of South American products into the United States, I fail to understand how the postal communication between Europe and South America is any explanation of the unimportance of our South American trade, or how a subsidized steamship company is going to help matters. It would not be denied by protectionists (see a letter signed "Merchant" in *Nation* of Sept. 27, 1877) that our tariff laws keep South American produce out of the United States, for this is plainly the purpose of such laws. It is also a fact that the protectionist party in the United States is of great political importance, and I am sure Mr. Hayes's Government would not dare to antagonize that party. Mr. Evarts is careful not to do so, or he would not suggest a subsidized mail service; for Mr. Evarts must see clearly enough that the modification of our tariff laws (and our navigation laws, also, would need revision) is the straight road to an enormous trade with South America, and to direct postal communication, without Government aid. Under these circumstances, Mr. Evarts's suggestion can only mean that our Government should assist our manufacturers to get their goods to South American markets direct. But in what can our manufacturers be paid? Referring again to the *Nation* of Sept. 27, 1877, we find your protectionist correspondent answering this very question thus: In bills of exchange drawn against South American produce shipped to Europe. But could such a trade as this gain any proportions? Could it warrant the subsidizing of a steamship company? Could it, in short, make possible the introduction of any large amount of our manufactured goods into South American markets? Now, every bill of exchange drawn on Europe, given in return for our manufactured goods, must be paid by the importation into this country of European merchandise. Have we any reason to believe that our imports from Europe can be so far increased over our exports to Europe as a large trade with South America implies? Are not the United States rich enough in resources to pay directly for all the European merchandise our people want? South America has products which the people of the United States want and cannot get. Can the wants of our people for European merchandise

be increased to accommodate a South American trade, working after the fashion described? These are questions which I think demand answers before we legislate to establish a steamship company.

But it may be said that we now have a South American trade *via* Europe; that the goods thus sent are paid for with European merchandise; that the subsidizing scheme only contemplates a simple change, in our favor, by which our manufactures will be sent to South American markets direct. But is the trade with South America, *via* Europe, of any great importance? If it appears to be so at present (I have seen no statistics on the subject) this can be accounted for by these two facts: first, that the stimulus of paper money has bequeathed to us an over-production of manufactured goods, which must be sold at ruinously low prices; second, that owing to the withdrawal of foreign capital from the United States, and the accumulation of gold in the United States (though this is of minor importance), our exports have latterly largely exceeded our imports. These facts would make it possible for Europeans greatly to increase their exports of our manufactured goods, but they imply a state of things which is abnormal and transitory.

Mr. David A. Wells, some two years since, in the *North American Review*, and afterwards in the pages of the *Nation*, discussed very thoroughly this question of South American trade. He argued its importance as an outlet for our over-production, as a means of giving employment to thousands of workingmen; but he also argued, and, as it seemed to many of us, very conclusively, that no trade with South America was possible which was not based on a direct exchange of merchandise. If Mr. Wells be right, Mr. Evarts's subsidy scheme is an absurdity, and can do no good. B.

Boston, Dec. 20, 1878.

Notes.

APPLETON & CO.'S announcements for the New Year comprise 'Selected Speeches and Reports on Finance and Taxation, from 1859 to 1878,' by Secretary John Sherman; 'Destruction and Reconstruction: Personal Reminiscences of the Late War,' by General Dick Taylor; 'Health, and How to Promote It,' by Prof. Richard McSherry, of the University of Maryland; 'Modern Fishers of Men among the Various Sexes, Sects, and Sets of Chartville Church and Community'; 'The Fairyland of Science,' by Arabella B. Buckley; 'Ocean Wonders,' by Wm. E. Damon, and 'Commercial Products of the Seas,' by P. L. Simmons, both illustrated; 'The English Reformation,' by the Rev. Cunningham Geikie; 'Bibelots and Curios: a Manual for Collectors,' by Frédéric Vors; Maudsley's 'Pathology of the Mind'; Élisé Reclus's 'Earth and its Inhabitants' (by subscription); a series of Health Primers, and numerous additions to their International Scientific, Experimental Science, School Science Primer, and Handy-Volume Series.——Charles Scribner's Sons have ready in pamphlet and also in book form Mr. Geo. William Curtis's recent oration at the Academy of Music, before the New York Historical Society, 'On the Life, Character, and Writings of William Cullen Bryant.' They have in press a fifth revised edition of President Woolsey's 'International Law,' printed from wholly new plates; 'Gleanings of Past Years,' being Mr. Gladstone's chief contributions to periodical literature from 1843 to 1878, in five small volumes; Jules Simon's 'Government of M. Thiers'; Max Müller's 'Hibbert Lectures on the Origin and Growth of Religion as Illustrated by the Religions of India'; 'St. Paul at Athens,' by the Rev. Charles Shakespeare; and Prof. Boyesen's study of Goethe and Schiller.——A fourth revised edition of 'An Essay contributing to a Philosophy of Literature,' by Brother Azarias, Professor of English Literature in Rock Hill College, Md., is soon to be published by Claxton, Remsen & Haffelfinger, Philadelphia.——John Wiley & Sons have issued the third edition of Prof. J. D. Dana's 'Manual of Mineralogy and Lithology,' rewritten and brought up to the mineralogical standard of the present day. The few pages devoted to lithology bear the stamp of the author's somewhat peculiar views upon this subject. He quite ignores the classifications adopted by the German geologists, and omits entirely one of our most wide-spread volcanic rocks, as such, which, in a work of this kind, should at least receive some mention.——A most admirable little work of a somewhat novel kind, viz., 'An Elementary Geology,' which treats only of a limited area, the Mississippi basin, has just been published in Cincinnati by Van Antwerp, Bragg & Co. Instead of using the stereotyped illustrations found in the majority of geological text-books, the author has drawn upon the ample material furnished by the publications of the various State Surveys, thus impressing more vividly upon the mind of the learner, by the familiarity of the natural phenomena cited, the general truths he desires to teach, and at the same time affording to the general reader a great deal of otherwise practically inaccessible geological information. The book is written in language which, while clear and concise, is simple without being childish, and the woodcuts with which it is profusely illustrated are not only new but well designed and admirably executed.——B. Westermann & Co. send us the *Almanach de Gotha* for 1879, in which the greatest changes have arisen from the Treaty of Berlin. Montenegro, Servia, and Rumania take their place in it for the first time as independent states and as reigning families. Two of the portraits have exceptional interest—Mercedes and the Pope, the latter showing a face of much shrewdness and an intellectual forehead.——The Roman papers announce the intended publication, in March next, of a newspaper by the Papal authorities in the Vatican. It is to be printed in five different languages, Italian, French, Spanish, English, and German, and possibly (considering the interest in the Eastern question) in Greek. It will publish the Papal briefs, allocutions, and other official documents of the Government. The form will probably be an eight-page folio, and an edition of at least 50,000 copies is expected to be printed. The editor-in-chief is to be Monsignore Pecci, brother of the Pope, whilst the managing editor is the strongly ultramontane Count Connestabile, of Perugia.——An Executive Committee of the Alumni Association of Harvard College is engaged in raising funds for a likeness, in bust or medallion, of the late Gen. W. F. Bartlett, to be placed with a suitable tablet in Memorial Hall. Any surplus will be devoted to the benefit of his children. The Treasurer is Gen. Charles L. Peirson, 44 Kilby Street, Boston.——The Brooklyn Historical Society will listen on the 14th inst. to a lecture by the Rev. Henry G. Spaulding on "Some Recent Advances in Classical Archæology," with views of excavations and explorations. Mr. Spaulding will deliver in that city and in New York this winter a second course of his excellent illustrated lectures on Roman Life and Antiquities.

—The following sentence in our article last week on page 4, column 2, near the top, "There is more doubt now than there has ever been that such men [*i.e.*, such statesmen as American society needs] exist," should have read, "There is *no* more doubt," etc. The succeeding sentence, "but there is a great and wide-spread disbelief, etc.," implied the antithesis the types failed to express.

—We have received from the chairman of the special committee of the Chamber of Commerce to which was committed the question of concurrence with the York-Antwerp rules of General Average, a reply to the censure on his course in opposing concurrence which we printed last week in a letter from a correspondent. The reply will appear in our next issue, being unavoidably deferred for want of space.

—The necrology of 1878 embraces many ex-sovereigns, of whom only Pius IX. need be named. Cut off in the midst of their rule were Victor Emanuel, the unfortunate Queen Mercedes, and the Princess Alice. It was a bad year for bosses: Tweed and Morrissey in this country, and J. J. Fazy in Switzerland, going the way of all flesh. Italy lost the patriots Pallavicino and Lamarmora; Greece, her revolutionary statesman, Demetrius Bulgaris; Hungary, Michael Horváth, Kossuth's Minister of Education; France, the imperialist Pierre Magne and Montauban, and the Republican Garnier-Pagès; England, the veteran Earl Russell. Our own loss has not been great: both Benjamin F. Wade and Gideon Welles could well be spared. No military or naval name of the first rank has been extinguished. Marshal Baraguay d'Hilliers died at eighty-three, fuller of years, perhaps, than of martial honors. The heroic defender of Belfort, Col. Denfert-Rochereau, did more for his country than for his Protestantism by saving that fortress to France. A not low type of the soldier of fortune passed away in the person of Col. F. W. Rüstow. Our civil war has been recalled by the deaths of Gens. August Willich and Geo. F. Shepley and Rear-Admiral Hiram Paulding, on the Union side; of Gideon J. Pillow and Commodore Geo. N. Hollins, on the Confederate.

—The roll of scientists is somewhat more brilliant, mustering a Claude Bernard in physiology; an Antoine-César Becquerel and a Robert von Meyer in physics, the one strong in electricity and magnetism, the other an independent discoverer with Joule of the dynamic theory of heat; a Karl Rokitansky in pathological anatomy; an Ernst Heinrich Weber in optics and acoustics; and the Nestor of botanists, Elias Magnus Fries, of Upsal. Somewhat below these, but still of high rank, are Victor Regnault, physicist and chemist; Father Angelo Secchi, the Papal astronomer, whose attention to solar physics grew out of the share he took while in this country in Prof. Henry's experiments

in this direction; A. L. Mörch, the Danish conchologist; P. Bleeker, the Dutch ichthyologist; and Thomas Vernon Wollaston, the indefatigable English entomologist. Mention should also be made of A. Lamy, who discovered simultaneously with Crookes the metal thallium; and of Gustav Wallis, whose botanical explorations in South America and elsewhere enlarged the horticulture of Europe by a thousand new varieties. Worthy to rank with the first of the foregoing was our own Joseph Henry, and we have lost also Wm. M. Gabb, geologist and palæontologist, Charles Fred. Hartt, geologist, and Dr. Charles Pickering, the naturalist of the Wilkes Expedition. Here also may appropriately be remembered Thomas Belt, the delightful "Naturalist in Nicaragua"; Sir Charles Buck, the Arctic explorer; and the travellers J. G. Kohl, Baron Ernst von Bibra, and J. J. Monteiro, together with that ardent promoter of geographical science, August Heinrich Petermann.

—In pure literature we may say that there have been no irreparable losses. England enumerates George Henry Lewes, the historians Sir Edward Creasy and Sir Wm. Stirling Maxwell, the novelist Whyte-Melville, Mrs. Fanny Bury Palisser (Marryat's daughter and a friend to china-maniacs), Mrs. Favel Lee Mortimer, author of 'Reading without Tears' and of other juvenile works which have had an enormous vogue, and Henry S. King, both author and publisher. Another publisher, Basil Montagu Pickering, is familiar to the lovers of good books, and M. A. Poulet-Malassis deserves mention as among the first to revive fine and decorative printing in France. Russia misses her great poet, Nekrasoff, and antiquary, George Tolstoi; Spain, the historian and archæologist, Don José Amador de los Rios, and Escosura, the poet-dramatist; Italy, the popular poet, Aleardo Aleardi; Poland, an admirable translator of Homer, Siemienski; Germany, Karl Gutzkow, the novelist, a relic of the "Young Germany" of fifty years ago. In this country, Bryant and Bayard Taylor and Mrs. Sarah Helen Whitman, among the poets, and Evert A. Duyckinck, the literary cyclopædist, complete the tale.

—Among the men of learning we mention J. J. Hoffmann, of Leyden, the first Japanese scholar of the time; Niels Ludwig Westergaard, the Danish Orientalist; William F. Mayers, the promising Chinese scholar; Joseph Bonomi, the Egyptologist; James Whatman Bosanquet, an authority in Biblical chronology and Assyrian history, and a patron of research in these fields; Theodor Keim, the master of early Christian history; and Dr. Johann Alzog, the Roman Catholic ecclesiastical historian. In the domain of art Cruikshank's leads all other names. C. F. Daubigny and Émile Lambinet, the French landscape-painters; Domenico Induno, an Italian master of the brush; Giuseppe Mengoni, the leading Italian architect; the Austrian sculptor, Fernkorn; and Sir Gilbert Scott, architect, are the only other notable losses of the year. Adolph Braun, of Dornach, has secured a long remembrance and an honorable association by his carbon prints after the old masters. The late Richard Upjohn, architect of Trinity Church, has the distinction of having broken the way for "pure" architecture in the United States. Only two conspicuous inventors—Thomas Winans, of Baltimore, and Sir William Mitchell, to whom we owe the international marine signalling code—are among the dead of last year. Akin to them as pioneers were Edward K. Collins, founder of an ill-fated line of American steamships; Henry Wells, the leading spirit of "Wells-Fargo"; and William Orton, head of the Western Union Telegraph Company. The philanthropists include Mme. Marie Pape-Carpentier, *inspectrice générale des salles d'asile;* George Thompson, who helped powerfully to free the Anglo-Saxon race from the iniquity of slaveholding; his colaborer and countryman, the chartist, Henry Vincent; and among us, Charles C. Burleigh, William Goodell, Miss Catherine Beecher, and (unprofessionally) Theodore Roosevelt. Journalism suffered by the death of Samuel Bowles and John A. MacGahan; and the stage by that of the admirable Charles James Mathews.

—The name of Caleb Cushing, who died on the 2d inst., all but belongs in the foregoing list. Mr. Cushing was born in Salisbury, Mass., and had nearly completed his seventy-ninth year. His career was of almost unexampled variety and activity, and such were his native talents that neither his want of principle and frequent change of party and opinion, nor his advancing age, could keep him permanently "on the shelf." He entered Congress as a Clay-Whig Representative in 1835, worked vigorously to secure the election of Harrison, and before he left the House in 1843 had "Tylerized" and definitively cast in his lot with the Democratic Party. Tyler gave him a commissionership to China in the last-named year, and he there negotiated an important treaty. When the annexation of Texas had borne its legitimate fruit, and Massachusetts would not raise troops for the slaveholders' war with Mexico, he recruited a regiment at his own expense, became colonel of it, and after joining Taylor was made brigadier-general by President Polk. As a commander he was heartily detested by his own soldiers, and some of the traditions of his discipline in maintaining the hygiene of the camp show that his treatment of men could be brutal in the extreme. While still in the field he made that unsuccessful run for Governor of Massachusetts which Hosea Biglow has immortalized in his "John P. Robinson he." "Gineral C.," however, had the good fortune to be a great man in a little village, and when the State at large would not give him anything to do he was always sure of being made mayor of Newburyport, or its representative in the General Court. His then fellow-Democrat, Governor Boutwell, appointed him to the Massachusetts Supreme Court in 1852, but he shortly resigned this position in order to take the U. S. Attorney-Generalship under President Pierce (1853–57). In 1860 he presided over the divided Charleston Convention, and later over the rump which nominated Breckenridge at Baltimore; but after Sumter he offered his services in any capacity to Governor Andrew, to assist in the maintenance of the Union, and fairly put himself in harmony with the new order of things. In 1866 President Johnson appointed him with two others to revise and codify the U. S. statutes. In 1872 President Grant sent him to Geneva as one of the American counsel in the *Alabama* settlement, in 1874 nominated him Chief-Justice of the U. S. Supreme Court, and failing in that, in spite of Mr. Sumner's support, sent him to Spain, where as Minister he brought the *Virginius* affair to a satisfactory conclusion. In the late Massachusetts campaign the Butlerites attempted to put him on their ticket, so that up to the last moment he was kept in mind as a public character of unlimited capacity for service. Administrations of every shade had found him useful, he was considered by his opponents an ornament of the General Court, and he was a hard and faithful worker wherever employed; yet nobody ever trusted him except in a professional capacity, and neither his political nor his forensic addresses have given him a renown like that of Webster or of Choate. One familiar quotation we owe to his temporary despair of the Republic, when he foresaw anarchy and then the "man on horseback." Perhaps no better epitaph could be devised for him than the panegyric written thirty years ago by his successor at Madrid in these words—"a dreffle smart man."

—It is difficult to say whether Charles Reade's 'Double Marriage,' now being given at the Lyceum Theatre, is a melodrama or a tragedy; it is certainly what is now called an "emotional" play. The scene is laid at the time of the French Revolution, and the play opens with the sale, under the hammer, of the castle of Beaurepaire, belonging to one of the oldest families of France. The household consists of the Baroness (Mrs. E. L. Davenport) and her two daughters, *Josephine* and *Rose* (Miss Alice Lingard and Miss Kate Claxton). *Raynal*, a French officer, buys the château, and, finding that the sale is the cause of great distress and misery to the family, immediately proposes to settle the difficulty by marrying *Josephine*. *Josephine* is already betrothed to *Émile Dujardin*, another officer, a friend and comrade of *Raynal*, but supposed to be dead. For her mother's sake *Josephine* accepts the offer. *Rose* (who represents comedy and coquetry, as opposed to *Josephine*, who is to be the tragic character of the play) is interested in *Édouard Rivière*, whom she, however, torments most unmercifully. No sooner has the marriage taken place (*Raynal*, having no time to waste, insists on a civil ceremony), and the husband departed for Egypt, than in walks *Émile*, who has been through every sort of danger and privation, and comes home to find *Josephine* married to another man. However, being too ill to be moved, he remains at the castle, and in a long time news comes of the death of *Raynal*. A secret marriage (in accordance with the forms sanctified by the Church) follows, and *Émile* and *Josephine* are happy. The *Baroness* is not allowed to know the fact, and, so far as she is concerned, the rest of the play is pure mystery until it is rather abruptly cleared up in the fifth act. News now comes that *Raynal* is not dead at all, and this terrible blow is shortly followed by the appearance of the first husband in person, who finds, to his surprise, an unexpected addition to the family in the shape of an infant in arms. *Rose*, to save her sister, declares she is the mother and *Émile* the father of the child. The next scene is in the trenches before Phillipsburg, where, after further complications between *Raynal* and *Émile*, both of whom meet at the seat of war, *Raynal*, determined to sacrifice his life, draws the lot to lead a forlorn hope against an undermined bastion; *Émile*, however, anticipates him, leads it himself, the bastion is taken, the mine sprung, and the attacking party is

blown into the air. *Raynal* now returns home, learns all, explains to the assembled family that under the French law a civil marriage may be annulled by mutual consent, tears up his own marriage contract, thus making *Josephine* the wife, or rather the widow, of *Émile*. No sooner has this been done (it should be said, however, that previous to this, affairs had reached such a tragic pitch that *Josephine* had attempted to poison herself) than *Émile* turns up again, and there is a final reunion, the generous *Raynal*, however, being left completely in the lurch. Of course, *Rose* and *Rivière* make up their little difficulty. A *résumé* of the plot makes it seem like a tissue of absurdities, but the play, as is sure to be the case with anything in which Charles Reade has had a hand, has many strong points. The dialogue is very good, the action rapid, the alternations of tragedy and comedy well arranged, and the part of *Josephine* is capable of being made very interesting. Miss Claxton, who is herself a better manager than actress, has collected several very fair actors in her little company at the Lyceum, among the rest Messrs. Robinson and Stevenson, and Miss Lingard ; the two former taking the parts of the rival officers. Mr. Robinson always succeeds in making a part with anything in it interesting, and Mr. Stevenson, though too quiet an actor for *Émile*, displayed remarkable force in the forlorn-hope scene. Miss Lingard's acting was throughout good, and she showed at times such genuine tragic feeling as to inspire a regret that the play could not have ended at its real climax, where she attempts suicide. Never have we been more sorry to see a life saved.

—We trust that there is no mistake in the rumor that Mr. W. D. Howells's "Counterfeit Presentment" is to be brought out in New York this winter. Its success last year in Boston and other New England cities would certainly seem to warrant its production, though we do not know what manager thinks of putting it on the stage. We hear a great deal nowadays of "American" dramas and the necessity of encouraging toiling American dramatists, who mainly occupy themselves with conveying late French plays by the aid of an indifferent translator and the substitution of American for French names and places. After the process is completed these plays usually present a picture of life about as like that which usually goes on in America as it is like life in Hindustan. An intrigue with a married woman, and a duel, are among the common incidents of these plays, and a foreign count or two usually appears, associating intimately with representatives of "leading New York dry-goods houses" or Boston bankers. Mr. Howells has, on the other hand, written a genuine American play, in which the characters are real American men and women, and the incidents such as might naturally happen to American men and women. It is a genuine comedy of American life and manners, and we hope the public here will be given before long an opportunity of seeing it.

—The tenement-house question in New York has an important bearing on both public security and health. Overcrowding, bad ventilation and drainage sow seeds of disease which are liable to spread throughout the city, and the herding together of families without a proper separation of age and sex has a demoralizing effect which, more than almost any other cause, swells the ranks of crime. The Association for Improving the Condition of the Poor have taken the matter up in an enterprising spirit, and have already done much toward promoting the execution of existing laws, which are sufficient, if obeyed, to provide for the correction of present evils. Landlords, in the building and management of their houses, are often wholly careless of their tenants' welfare. To them the law should be vigorously applied ; but landlords are not always the only delinquents. The prevalence of filth and misery is often due entirely to the habits of the tenants themselves, and good drainage is not promoted by the stealing of lead pipe. The reforms most needed are good drainage, ventilation, and a complete isolation of the separate families living under one roof. These results can only be attained by a severe supervision over the construction of new buildings, for which full power is given the Board of Health by law. Model tenement-houses cannot now be built in New York on account of the excessive supply of tenement accommodation. In London, where the need has been felt to a far greater degree than in this city, many model dwellings have been built, some of which have satisfied the interests of both landlord and tenant. They have also been attended with great success in Brooklyn and in Boston, but New York is not yet ready for them. Rents are now so low, and there is so much unoccupied accommodation, that model tenements would not fulfil the necessary condition of paying a good return on the investment. When such buildings are erected, they will be found most satisfactory and profitable if built and managed by private persons rather than by a company in connection with a philanthropic society. Any business managed through agents is less profitable than when it has the personal supervision of interested parties. The success of the "White" tenements in Brooklyn may be largely ascribed to the fact that they have been managed in this way. Meanwhile, much good might be accomplished by the Association for Improving the Condition of the Poor by a publication of the plans which have had success in London and Brooklyn. It is reasonable to suppose that future buildings would be erected with due attention to these improvements if their details were easily attainable. The Association is doing an excellent work in this direction, and deserves the strongest support of all interested in the welfare of the city.

—Prof. Edward S. Morse has written an interesting paper on the "Traces of an Early Race in Japan," which throws light on a subject hitherto wholly obscure. A race of men called Ainos are believed to have come down from Kamtchatka and to have taken possession of Japan, which they held until displaced in their turn by the Japanese from the south. Of the two races, the Ainos and the Japanese, authentic records exist, but nothing has been known concerning the ancient people whose territory was appropriated by the Ainos. The only knowledge obtained of them has been ingeniously acquired by Mr. Morse by a careful study of "shell-heaps" in all respects similar to those found along the shores of Denmark, New England, and Florida. The deposit discovered by Mr. Morse near Tokio contained pottery and broken bones, many of which were human. It is generally admitted by ethnologists that a people that has once acquired the art of pottery will always retain it ; but as neither the Esquimaux, the Kamtchadales, nor the Ainos are essentially earthen-pot-makers, these remains naturally point to the former existence of a race in Japan who preceded the Ainos. Again, both the human and the deer bones found in this shell-heap were broken in a manner to facilitate the extraction of the marrow or to enable them to be placed in a cooking-pot, a circumstance which points to the existence of cannibalism among the people by whom the shell-heaps were made. On consulting Japanese scholars and archæologists Mr. Morse learned that the Ainos were not only not cannibals but were of an especially gentle disposition. The existence of an ancient race of cannibals in Japan, before the occupation of that country by the Ainos, is therefore made very probable. We hope to see another paper before long containing an account of Prof. Morse's later researches.

OUR BEST SOCIETY.*

"IN response to numerous and constant applications from all parts of the country for information regarding social forms and usages in New York" an anonymous writer has prepared and published a series of essays, under the title of 'Social Etiquette of New York.' "Special pains have been taken to make them represent faithfully and accurately existing customs in New York society, in distinction from the many manuals on the subject that have simply reproduced the codes of Paris and London." The manual is designed to furnish "a report or a description of our customs as taught and practised by the superior families of New York." We have examined this new code with care, and can cordially recommend it for study and adoption among superior families the world over. Etiquette, as those who have studied it most carefully well know, is an absorbing and inexhaustible subject of enquiry and analysis ; and perhaps no better time for the publication of a work on American etiquette could have been selected than the present, when an attempt is being made to introduce into Canada a distinctly foreign code. For the benefit of families which are trying to become superior we shall give a few extracts from the manual.

The first chapter, on "The Value of Etiquette," is, perhaps, hardly critical enough to suit a severe taste. The codes, the author observes, which different civilized nations "have provided for themselves," to suit "their peculiar sentiments and requirements," "serve as a music that is felt when not heard, and communities walk by it in beautiful harmony and ease" ; and, carrying out this musical similitude, she adds that "the slight and agreeable variations which are often made in the forms and usages of well-bred people in their intercourse with the world may be compared to the different parts of that same melody" (*i.e.*, one "that sings itself in one's thoughts without a sound being heard"). For those who do not believe in the value of etiquette, the author throws out the suggestion that "possibly those vagrants who scorn etiquette, and refuse to take the white high-road of a refined civilization, do not possess those

* 'Social Etiquette of New York.' New York : D. Appleton & Co. 1878.

necessary aptitudes for imitation which are requisite for the easy acquirement of customs and formalities which are by birth alien to them"; but adds, guardedly, that "if such undisciplined persons would only submit to custom, and use their best powers of adaptation, they would soon discover that formality is as easy as a tune," etc., etc., etc. This, however, is merely prefatory.

It is in chapter ii., on "Introductions," that we feel that we have really reached the serious part of the work, and the only fault that can be found with it is perhaps a tendency to a slight obscurity here and there. The statement that "ladies of social equality are introduced to each other," qualified or fortified by what follows, "so also are gentlemen," unquestionably correctly describes the better practice as prevailing in New York. But when the author says "it is probable that from the foreign custom of announcing guests from the thresholds of *salons* by a loud-voiced servant is acquired our habit of mentioning the name of the less important or the younger person first," we confess that we do not quite follow her. Is it the loud-voiced servant who on the threshold of these foreign *salons* announces the names of persons younger or less important than himself? It has often struck us that the visitor was at a great disadvantage when compared with the loud-voiced servant, and must feel himself very much less important after the ceremony than before it. But what is the connection between this foreign fashion and our New York custom? Again, the author tells us that "the forms of introductions and presentations must necessarily differ in a country where an equality of citizenship is established by constitutional law," and we feel that she is right, but should be glad of a little more explicit information as to how they differ, and what they differ from.

Chapter iii., on "Salutations," shows that the superior people of New York have carried the practice of etiquette to a high level. The author starts with the assumption that "if bowing to a lady expressed deference, then might any gentleman incline his head to every woman he met." This seems based on the belief that every woman you meet on the street is a lady, a fact which police statistics show to be untrue. But this is of comparatively little importance, because it is well settled that bowing to a lady does not express deference, but recognition. The first point to be determined is who ought to bow first; and it seems that in New York it is the lady's right to recognize an acquaintance first. The only exception to this rule is the case of a young man who has been invited to a house by a "matron with many social cares," who "cannot charge her memory with the features of her multitude of young acquaintances." If a young man who has been invited to such a matron's house meets her in the street he may bow first. We should be inclined to admit another exception—when a gentleman meets a lady whom he knows to be near-sighted without her glasses. In the case of meeting a totally blind lady it is difficult to know how to act. "A faint smile and a formal bow" is all that any gentleman must expect from a lady—that is, in public places. "Under all circumstances, upon the promenade, the street, or in other public places, her smiles are faint and her bows are reserved, but they are not discourteous," and it is pointedly and most properly added that "no gentleman possesses the right to criticise this dignified demeanor, no matter how cordially she may have received him at a recent ball, or when he last paid his respects to her at her home." In a private house we suppose she may smile less faintly, or even laugh outright.

On entering a parlor to pay a visit "a gentleman," the author informs us, "should always carry his hat, leaving his overshoes, overcoat, and umbrella in the hall, if it be winter time." But it must not be inferred from this that in summer it is necessary for him to wear his overshoes, overcoat, and umbrella in making a visit. To return to the street again, an awkward question which must have often suggested itself to students of etiquette is here neatly disposed of—What should be done by a gentleman who meets a lady in the street who is offended with him, but whom "he may respect and feel kindly toward"? Under these circumstances, "It is permitted to him to express his continued reverence by uncovering his head in her presence; but he has no right to look at her as she passes him. He must drop his eyes."

The chapter on "Parties, Balls, and Germans" raises some hard questions, among others one which, as the author says, "has long been in dispute," viz., "Which side of the stairway, the rail or the wall, should be accorded to a lady?" This question has, it seems, been discussed by gentlemen "as if it were for them to decide, which it is not by any means." Such ladies, she pointedly adds, "as have been given their choice" have invariably said: "Permit me to take your left arm with my right hand, and it does not matter whether it is wall or rail that I am nearest in going up or down stairs."

In chapter x. there are some directions with regard to "Dinner-giving and Dining-out" which will prove of value to the young and inexperienced. "If wine be provided and the guest does not approve of it, a private table is not a suitable place for expressing individual convictions." He is further directed to "receive or turn the wine in the different glasses sparingly, and make no comment." At a public dinner "the freedom of the occasion permits a noticeable rejection of wines," though according to our experience this is a freedom not much taken advantage of. We miss one direction in this chapter which we remember to have seen in an old English book of etiquette, a maxim observed by the superior families of New York, though of English origin—"Do not throw your bones under the table or put them upon your neighbor's plate."

It will be seen from the above extracts that there has been evolved in New York a delicate and refined social code which ought to answer all the purposes of the city, considering its present rate of growth, for some years to come. It would be interesting, did our space allow, to speculate upon the effect which the regular practice among the superior families of a city like New York of a code like this might have upon its political institutions. Tocqueville has an instructive chapter on the Influence of Democracy on Manners, and our author appears to think that an "influencing sentiment of common sympathy was born and nourished by republicanism." The influence of Manners on Democracy would be an interesting subject of investigation, and might lead to useful practical results. Are good manners truly democratic, or are they vestiges of an extinct state of society, which have come down to us by a process of "survival," and which are destined finally to disappear for ever, or are they really based on a vital principle and destined in their development to sap the foundations of our liberties? Those whose tendency it is to despair of the Republic might bring forward some strong arguments in favor of an inherent antagonism between good manners and Republicanism. The machinery of society, they would say, is founded on the idea of an acknowledged inequality, which it is our mission as a people to abolish and extinguish throughout the world. For it is to be observed that, though *after* admission to that part of the public which occupies itself with carrying on "society," strict equality is presumed and even insisted on where it does not in reality exist, the principle of *exclusion* is one of inequality and to a certain extent aristocratic, as those know very well who have tried to secure admission, and found that the absence of a certain inherited aptitude, the lack of a bent in the direction of correct grammar, or spelling, or dressing, was a serious stumbling-block. With many of our leading statesmen a habit of saying "them" for "those," and using "be" where grammarians insist on "am" or "are," or appearing in a dress-coat in the early morning, or a frock-coat at a ball, has been found in politics not only not to retard but even perhaps to accelerate their advancement; but socially such solecisms form, even in a republic, a serious obstacle, which it requires a great amount of reserve force in the shape of money to overcome. But then, money does not, as is sometimes said, make society democratic. A society founded simply on distinctions of wealth would probably be the most undemocratic in the world, because money is the most coarse and vulgar test which can be applied. The fact is that no hard-and-fast line can be drawn which will indicate the limits of "society." Money, success, and distinction in any of the callings or professions (including, in the United States, dry-goods), birth and beauty, will all at different times and places be regarded as qualifications; but this is not democracy. If society were truly democratic, all would be admitted without regard to anything, as they say in Washington, but the simple fact of American citizenship. Again, society could not be kept going for a day without the institution of domestic service—or, in other words, without a large number of our fellow-citizens being trained to devote their time and attention to ministering to the pleasures of their employers. There can be nothing abstractly more undemocratic than the spectacle of a citizen, clothed with full civil and political rights, enjoying the privilege of *habeas corpus*, and the right of petition and of carrying arms, blacking the boots of another citizen, without any reciprocal right of having his boots blacked in turn by the latter. All these things show that the laws which govern us in the world known as "society," and those which operate upon us under the Constitution and laws of the United States, are not only different but opposed, and it is from a half-conscious perception of this fact that some of our greatest political leaders have shown at times a dislike and suspicion of the established social laws and observances. Thus, it is related in Randolph's 'Life of Jefferson' that one of his first acts on becoming President was to abolish the formal "levees" established by Washington, and introduce

the modern White-House reception, an institution which may be regarded as a standing National protest in the interest of Democracy against the evil tendencies of society, and so too he did away with all the ceremony with which Washington had surrounded the opening of Congress, the procession to the Capitol, and the reading of the message in person. Another protest was made when American diplomats were forbidden to wear uniform.

So, during the recent Butler campaign in Massachusetts—in which, as is well known, the hostility that raged between the people at large and the exclusive and disdainful "society" which governs and directs the venal press of the large cities was most furious—no more marked proof of the depth of feeling was given than in a widely-read speech of the General's, in which he announced his determination to break up the practice of amateur coach-driving in New York, in itself a harmless if unprofitable occupation affected by a class of young men who, as a rule, it must be confessed, neglect their full duties as American citizens, and who at the same time are, to a certain extent, representatives of "society." Indeed, it might be said in a negative way that our best society is, to a large extent, made up of citizens who do not perform their political duties, and deride those who do—a fact strongly tending to corroborate the pessimistic view of the relation between Manners and Democracy. Eternal vigilance is the price of liberty; and if it is the spread of Good Manners which is sapping the foundation on which the primary and the convention and other safeguards of our rights rest—if it is impossible, as some persons maintain, to be at once a good citizen and a well-bred man, the fact ought to be made plain, so that the public may understand what the superior families of New York are about.

RECENT POETRY. *

'THE Masque of the Poets' represents fairly the strength and variety of contemporary verse, especially of that chorus of singers who sing because the sun rises and it is May. The friends of these lesser poets will see it well illustrated in this volume that the activity of their favorites is determined by common intellectual and moral influences of the time upon more than ordinarily sensitive organizations, and that there is but little original and distinctive character in their works; indeed, beside the entertainment of these verses, they have considerable value as an index to the common qualities of American poetry and a reflection of American life in what is presumably its most sensitively organized and cultivated phase. There is nothing positively dull here except the "Ballad of the Wicked Nephew," and there is nothing really of the first order. The narrative poems seem to us the best. "From Herzegovina," despite some uncouth phrases of rough realism, "The Rebel Flower," "Jasper Oakes," and others, are stories told with clearness, directness, and simplicity; "Red Tape" and "Question and No Answer" are very excellently done; "Amy Margaret," "Provençal Lovers," and "Theocritus" are graceful; "The Medallion Heads" are creditable, and the limited charity and italicized words in "La Fornarina," the second of them, point to a woman's hand. Others are worth mention for excellent work in parts, but Guy Vernon's story, as has been remarked elsewhere, is hardly so light that it needed to be told in such a tripping metre—in a less degree as if Browning had written "Pippa Passes" in the measure of "Beppo." The book has won a deserved success, and already reached a third edition.

'Drift-Weed' is a fitting title for the volume in which Celia Thaxter has collected her late verses; as is her custom, the sea, which, through her early years by the shore and her home at Appledore, has most deeply affected her imagination and guides the suggestions of her thought, is the subject of her best poems, and her work is much inferior when she writes of other things. Yet it seems to us that even here she deals with the cruder colors in sea-scenery and the violent contrasts of the thought and sentiment it suggests; we should prefer more of the imaginative work shown in the description of the leviathan in the storm, and less of the merely red sunset. Perhaps it is through his cousinship to Mrs. Thaxter that Mr. Laighton has come with cousinly admiration to be her disciple. His little volume is less vivid and less expert in structure than hers, but is of the same aim and character; it has more of womanly than manly feeling. Mr. Gilder also is a writer of imitative verse; his previous volume, 'The New Life,' bore in its title the confession of this, and his new work is as distinctively the product of the pagan school, as it is called, but under the influence of Rossetti rather than Swinburne, who contributes only mannerisms of style and versification. It is refined and exquisite in many respects, but both its refinement and finish are echoes, which is only another way of saying that it says what has been already said, and says it more weakly. One little poem illustrates the single tenet of this school, and suggests its fatal defects in attempting to ground conduct on one principle:

"On the wild rosetree
Many buds there be,
Yet each sunny hour
Hath but one perfect flower.

"Thou who wouldst be wise
Open wide thine eyes,—
In each sunny hour
Pluck the one perfect flower."

Even from this stand-point how much better co-ordinated with the facts of life is Blake's single stanza of like import:

"He who bends to himself a joy
Does the winged life destroy;
But he who kisses the joy as it flies
Lives in eternity's sunrise."

Mr. Gilder, too, shows defective taste occasionally; not to multiply instances, to speak of Christ as "*enticed*, by those he came to save, to the damned tree," is wholly incongruous with the dignity and value of the Saviour's sacrifice, nor should Mr. Gilder plead the necessity of rhyme, familiar as he must be with Dante's great words in regard to that. The poet, it is only just to say, seems to us to possess a finer native gift than he has yet revealed, and it is a pity that he should allow himself to do such imitative and ineffective work. It was with regret, too, that we read Mr. Leighton's "Change"; he had shown considerable promise in his two previous dramas, but this is a didactic scientific poem of one hundred and forty-three pages, and is a burden to the reader.

In 'Echoes of Song' we have a transcript of one aspect of Western social life. There are hymns, Sunday-school songs, poems for children, for patriotism, for temperance, and for kindred, "The Court of the Muses" for a school-girls' entertainment, and miscellaneous poems. All phases of common domestic life are represented, and the national or local enthusiasms have been duly chronicled. We were interested in a lawyers' dinner where, among other things,

"There were salads, and jellies, and russes,
And often on toast there occurred
A savory, mute protestation,
Against the hushed song of a bird."

There were two tables, a "Wine" and a "Red Ribbon"; we are not told which was most favored, but we are instructed at the conclusion of the poem in the plain prose opinion of Judges Garvey, Alderson, and Coleridge on the liquor-traffic. Perhaps the children's poems are, on the whole, most entertaining; from these, however, we have room to extract only one bright saying of a child who was framing hypotheses to explain the thunder by referring it to God:

"She said, 'I suppose, then, dear Ma-ma,
He's striking the Moon with his hand.'"

We have heard of a "spanking breeze," but we did not know that the simile had made any further invasion of natural phenomena.

The story of Francesca of Rimini had better have been left, where Dante left it, to the imagination, sympathy, and forgiveness of the unassisted heart; but it has been told in the small volume to which it furnishes the title with sensitive feeling, and the poem is executed carefully and with creditable success. There is much mannerism in it, and the suffix "-wise" appears in the most wonderful profusion, while the influence of Swinburne on the author is overpowering, of which the following may stand as a sufficient witness:

"O Love! the sea is deep whence thou wast born,
And in thine eyes betimes such sweet light hides
As of dim depths where night and noon are morn;
Beneath the bosom of its fitful tides
Men say indissoluble peace abides,—
And yet so swift thy shifting lights, ah me!
Who knows, who knows, if so or no it be?"

A similar story is 'Genevieve of Brabant,' but less known, and here one of the most delightful versions of it is told with taste and feeling. It is an excellent story for children, although possibly the author did not in-

tend it for them, both from its subject and simple treatment. Similar in its appearance, as a holiday work, is 'Iris: The Romance of an Opal Ring,' a novelette in verse, which describes how a poor boy fell in love with a wealthy Southern girl, went to the city, put his love into a book, won money and fame, and happily married her in consequence. Told in prose it would not have been a strong or touching story, and it loses in verse and by the accompanying illustrations.

TWO SHORT HISTORIES OF MUSIC.*

MR. HUNT'S 'History of Music' is constructed on a somewhat novel plan. The first sixty pages are devoted to a description of leading musical events and epochs, with biographical sketches of important—and not a few unimportant—musicians. Then comes a series of chronometrical tables of rather doubtful value, covering about twenty pages; while in the remaining eighty pages an attempt is made to trace the development of the modern scales, counterpoint and harmony, of vocal and instrumental music, the opera, oratorio, symphony, etc., and to describe in succession the various musical instruments, both orchestral and otherwise. Such an arrangement of topics, it is evident, is better suited to a work of reference than a history, and if, nevertheless, we are willing to recommend the work to those who wish to get a vague bird's-eye view of the subject, it is only because no work exists in our language that could even remotely be compared with the manuals of Dommer and Brendel, which, although by no means free from faults and imperfections, both deserve to appear in an English version.

When an attempt is made to compress into 150 pages such a very complex and comprehensive subject as the history of music, the first aim of the writer should be to avoid all waste of space. This Mr. Hunt has by no means done. The twelve pages devoted to examination questions could have been saved for some of the very important facts and criticisms which Mr. Hunt has left unnoticed. The same is true of the space occupied by the chronometrical tables, which few will take the trouble to understand. Moreover, the whole of page nineteen and portions of other pages have no business whatever in a book which endeavors to give the whole personal history of music in sixty pages. It is simply absurd in such a work to give biographical data relating to every insignificant doctor of music who has composed an anthem or two for the Church of England. The natural result of such a method is that no space is left for composers of ten times greater importance. A young student must surely get very erroneous ideas of the relative importance of composers when he finds almost a page given to Rossini, while Bellini, a man of more genius, is disposed of in two lines, and Donizetti in three. As "one of the more prominent among the composers of our own day" Sir John Goss, "without whose name no history of modern music can be complete," also gets half a page, while Rubinstein, Gounod, Brahms, and Raff *together* get no more space! Of Rubinstein we are simply told that he is a pianist of the first rank, and has composed concertos and other orchestral pieces. We had an idea that Rubinstein's operas, his beautiful songs, and his chamber music also deserved mention. Perhaps, on second thought, Mr. Hunt would also be willing to admit that Rubinstein, Liszt, and Saint-Saëns deserve to be enumerated among recent oratorio-composers just as much as Sullivan, Ouseley, Benedict, and Costa. It is only fair to add that the third part of the book is much more satisfactory than the first.

Dr. W. Langhaus, of Berlin, has published a series of twelve lectures on musical history which would make an admirable little text-book for those conservatories where it is not found practicable to give much time to historical studies. Dr. Langhaus mercilessly excludes all names which did not have an appreciable influence on the development of the art, and he thus saves space for criticism and for instructive comparisons of music at different epochs with the other arts, and with contemporaneous thought and manners. The lectures treat in succession of (1) the music of ancient peoples; (2) the music of early Christian times; (3) the beginnings of polyphonic music; (4) the musical supremacy of the Netherlands; (5) Luther's Reformation and the Renaissance; (6–8) Italian, French, and German opera; (9) the oratorio; (10) instrumental work; (11) the romanticists of the nineteenth century; and (12) Richard Wagner. This is a reasonable division of subjects, and enables students to remember facts in their proper connection. We could have wished, however, that the author had given a little more prominence to the three leading divisions of musical development, so admirably formulated by Helmholtz—the first period being that in which melody alone prevails; the second, the polyphonic or contrapuntal period, that in which several distinct melodies are united, the object, however, being here the avoidance of discords rather than the attainment of stirring harmonies; and the third period, that of modern music, in which harmony is the characteristic and predominant element, being here aimed at for its own sake, in order to arouse the deeper emotions.

The second of these periods is the one with which in our days we find it most difficult to sympathize. The crude endeavors formerly made to dove-tail together two or more distinct melodies are, however, very instructive, for they show us to how great an extent music is an experimental art, and how by slow degrees the complicated harmonies and rhythms of a modern symphony or music-drama were developed from the simple melodies and dance-rhythms of primitive music. But it is a very curious psychological fact that this progress from the simple to the complex should have been so energetically resisted at all times by people whose descendants derived so much pleasure from it. Our Thirty Years' War on musical territory, which may now be regarded as practically at an end, has frequently been repeated in the history of music, not only in Europe, but also in other quarters of the globe. Thus, in China, where a scale is used consisting only of five notes, an attempt was at one time made by Prince Tsay-Yu to introduce the two missing semi-tones; but he met with such angry opposition that the attempt had to be given up. His enemies asserted that to add these notes to the scale would be as absurd as adding two new fingers to the hand. Another curious fact, which may not be generally known, is that up to Luther's time it took two persons to produce a musical composition; one, the *phonascus*, who originated the melody, and a second, the *symphonetes*, who worked it up contrapuntally. Glareanus, writing in 1547, asserts that it might be possible to find a person uniting in himself these two gifts, but only very rarely. In view of this fact Dr. Langhaus thinks it probable that future generations may be as much astonished that we in the nineteenth century require two persons, one to write the libretto, and another to compose the music of an opera, as we are at this mediæval practice.

The Nation.

NEW YORK, THURSDAY, JANUARY 16, 1879.

The Week.

As the Southern question, thanks to Mr. Blaine, was the first that occupied the Senate at the opening of the present session, so Mr. Edmunds made it first in order on the reassembling after the recess on Tuesday week. He introduced resolutions prefaced by carefully-stated truisms in regard to the validity of the Constitutional Amendments, and the interest of the whole country in having them enforced, and leading up to the concluding declaration of the duty of Congress to provide by law for the protection of citizens qualified to vote for members of Congress, and directing the Judiciary Committee to report a bill for this purpose. Mr. Edmunds proposed this as a New Year's measure of harmony, and asked that consideration of it might be postponed a week. The next day he introduced a joint rule of unquestionable value, which was referred to the proper committee, prohibiting any bill passed by either house from being sent to the other after 12 P.M. of March 1, and any bill or resolution passed by both houses from being sent to the President after 12 P.M. of March 2. The repeal of this rule is made dependent on a vote of three-fourths of the members present in each house after one day's notice. On Friday the Senate passed the Indian Appropriation Bill, with amendments, and on Monday a bill appropriating $250,000 for a fire-proof National Museum adjoining the Smithsonian Institution.

The House has done little except to give the finishing blow (127 to 87) to the bill to reimburse William and Mary College for its losses in the war. Only three or four Republicans voted in the affirmative, and many Democrats in the negative. The work of the House has been interrupted by extraordinary mortality among its members, not less than four having passed away in the course of as many weeks, under circumstances which cause grave suspicion of the unhealthiness of the Capitol or of the city of Washington. Three of these were from the South, and all happened to be Democrats. The ablest of them by far was Gustav Schleicher, of Texas, a native of Germany, who had resided here since 1847; a man of training, independence, and industry, who set a shining example of the qualities desirable in a legislator, and whose removal from Congress is therefore a real calamity. His voluminous report on the Mexican border troubles is a monument of his zeal and research. Both houses paid him something more than a formal tribute on Monday, when the funeral services were ceremoniously but feelingly conducted at the Capitol.

The suggestion we made in our issue of August 8, 1878, that Congress should make no more appropriations of the public money for the benefit of communities guilty of fraud in refusing to pay interest on their loans, is, we are pleased to see, beginning to bear some fruit. Jackson County and Kaw township, Kansas, in which Kansas City is situated, are both shameless defaulters. The county in 1871 issued and sold bonds through its own agents to the amount of $350,000; the town did the same thing to the amount of $250,000, and put the money into a railroad, which is now in operation, and of which they are both reaping the benefit. Both, however, impudently refuse, without a particle of excuse, to pay either interest or principal of the bonds. At the last session of Congress they got an appropriation from the National Treasury for the erection of a new custom-house in Kansas City. We are glad to say that this has roused the indignation of the unfortunate bondholders, and they have petitioned the Secretary to refuse to build the custom-house until the county provides for the payment of its lawful debts, or, if he has no discretion in the matter, to delay the work until an effort can be made to induce Congress to reconsider its action. The building has not been begun, and the bondholders are now going before Congress with the very strong argument that they ought not to be taxed for the benefit of corporations which have already swindled them.

The Supreme Court has before it a somewhat similar attempt at fraud in the case of Huidekoper against Macon Co., Missouri. This county issued bonds in 1867 to enable it to purchase stock in a railroad, and it paid the interest until 1874. The bonds were issued under the authority of the charter of the railroad, which provided that the county might "levy a tax to pay the same not to exceed one-twentieth of one per cent. on all the assessed property in any one year." In 1874 the county stopped payment and the State Supreme Court held that the county need only levy a tax of one-twentieth of one per cent. for all purposes, and that the bondholders must take whatever they could get out of that, which was of course nothing. This decision was overruled by the United States Supreme Court in a case raised by the holders of similar bonds issued by Clark County, but the State court disregarded the decision, and now the point has been carried up again to the Federal court on the bonds of Macon County. A great many of these defaulting counties feel that "centralization" has gone far enough, and that there is too much meddling at Washington with local concerns.

The United States Supreme Court has decided on appeal in the case of a Mormon named George Reynolds, convicted of bigamy by the District Court in Utah, that the United States statute of 1862, prohibiting bigamy in the Territories, is constitutional. The only difficulty now in the way of putting down polygamy is that of supplying proof of marriage, and getting monogamous jurors; but this, the Mormons having been put on their guard, may be great. They may provide a mode of marriage which it would be all but impossible to prove in a Gentile court; and it is only by attacking the rights of children born of such marriages that they could be seriously discouraged—we will not say prevented. The great support of monogamy, even among Gentiles, is, after all, not so much the law as social opinion. If a man's neighbors and friends in New York thought he might fairly have two wives, the law would prove but a feeble restraint. It is to be observed, also, that legal prohibitions owe their efficacy in a large degree to the fact that as a general rule they create a right which some aggrieved person is interested in enforcing. For instance, among us a bigamous man is almost always pursued by an angry monogamous wife, who spares no pains to bring him to justice. Our statute would be of little account, however, if the first wife held bigamous views herself, and was willing to enter into a matrimonial partnership with the second. It is not at all as easy as it seems to suppress practices which have a religious source, and which do not create victims who feel themselves to be victims.

Mr. Schurz has replied to General Sheridan's "Supplemental Report," and after some slightly sarcastic observations on the General's use of the word "disingenuous," he goes on to say that many of the charges refer to the administration of his (the Secretary's) predecessors; that more of them relate to agents who have been dismissed and abuses that have been remedied, showing that the General had not brought his knowledge up to the latest dates. Reforms are still going on in accordance with the recommendations of the report of the Commission of 1877, and had the General had time to look into the actual state of affairs, the Supplemental Report would have been a complete vindication of the Indian Bureau, instead of an attack on it. To the Secretary's letter is added a report of

Commissioner Hayt's, dealing *seriatim* with the charges of starvation at the various agencies, which he says have been continuously coming in from the military posts ever since 1875. He brings forward facts and figures to show that, in several cases at least, these accusations were unfounded; but that men of the standing and character of the Army officers should make them, if they were absolutely without foundation, certainly requires some explanation. What is quite certain is, that Secretary Schurz is a formidable controversialist. There is hardly a politician in the Republican party who has not felt called upon, during the past six years, "to take a whack at Schurz," and not one has done so without considerable subsequent mental suffering.

The Cleveland *Leader* recently called attention with much force to the fact that, in spite of all that has been said of the unsoundness of the West on financial questions, resumption has been largely due to the efforts of Western men—*e.g.*, Sherman, Grant, McCulloch, Garfield—and thinks this is an answer to various reproaches which have been cast on the West in this matter by the *Nation*. But no paper has more strongly acknowledged the services of Western financiers to the cause of sound currency than the *Nation* has done. We have never, for instance, allowed a year to elapse since 1866 without testifying to Mr. McCulloch's claims on popular gratitude and confidence, especially in the midst of the crazy period before the panic, when it was the fashion to talk of him as a man who had tried to ruin his country by robbing it of its "battle-born" greenbacks. The Detroit *Post and Tribune* points out accurately the difference in the position of the Eastern and Western press and politicians on the currency question. The Eastern hard-money papers were all along expressing the sentiments of their readers, while the Western papers which fought on the same side were running in the teeth of popular opinion, and the Western politicians like General Garfield were risking their seats. Let us hope that the well-earned credit which he and others are now enjoying will infuse a little courage and honesty into the dodging, shirking, equivocating statesmen of both parties.

The Cincinnati *Commercial* repels our imputations with regard to its failing, in common with the Cincinnati *Gazette* and Chicago *Tribune*, to support the Resumption Act in 1877, and demands to be "taken out of that crowd." What happened was that the *Commercial* "weakened," as the politicians say, in July, 1877, and declared on the 8th of that month that the Resumption Act "was not originally a wise measure," and that what ought to have been done was to

> "organize such a state of things in the monetary system or machinery of the country as would have established a drift towards specie resumption, and let business solve the problem. . . . Having got the declared intent of the country to resume, it would have been, perhaps, wiser legislation to foster the sentiment in that direction by adhering to the excellent suggestions of Mr. Rowland's whereas, and omitting the designation of a day for the consummation of the Act."

It is true it admitted that, having been passed, the Act ought to stand, but the effect of such criticism, especially when accompanied with a paraphrase of the St. Louis platform, was undoubtedly to encourage those who were actively working for its repeal, and wanted to "drift" into the payment of their debts without naming any day when the creditors would get the money. In fact, the *Commercial's* plan of resumption ("to establish a drift towards resumption, and let business solve the problem") would have delighted Wilkins Micawber. He always wanted to meet his obligations by "drift," and to have "business," or the course of events, or the general progress of society, solve the various financial puzzles which vexed his life.

After considerable discussion the Lower House of the Virginia Legislature has passed resolutions inviting the State creditors, both foreign and American, to a conference at Richmond, on January 22, to settle the debt question. The project to hold the conference has been much opposed by some delegates on account of a belief that the burden of the debt was more than the State could bear, and that no settlement could be brought about with the creditors which would be sufficiently advantageous to make it worth while to keep up the credit of the Commonwealth. The auditor, however, makes a statement which disposes of this difficulty. The present rate of taxation is capable of yielding a revenue sufficient to pay four per centum on the public debt proper, if the present assessment on property can be maintained. No diminution is expected in the value of personal property, but in 1880 a general reassessment of real estate will take place, when a falling off in value of from twenty to twenty-five per centum is possible. In that case another source must be found for the required revenue. The Moffett Liquor Law, if properly enforced, would yield over $300,000 more than it has yet done, and the deficiency would thus be amply made up. As the principal creditors have shown a disposition to be satisfied with an interest of four per centum, everything now points to an amicable settlement, unless the "readjusters," who are opposed to paying more than three per centum, have strength enough to interfere.

The annual message of Governor Robinson is always refreshing reading, because it has two qualities not too common in political papers: it is marked by a spirit of truthfulness and it is very outspoken. He gives an encouraging picture of the State finances; shows that the State tax has been reduced since 1874 from over $15,000,000 to less than $8,000,000, that there is no longer any General Fund debt, any bounty debt, or any floating debt, and that there is good reason to hope, now that resumption is accomplished, for a period of general prosperity. With regard to the canals and the prisons, the facts presented by his message are a striking proof (though he says little on this point) of the success in the reformed system of managing the public works introduced by Mr. Tilden's constitutional amendments. There is a decrease in the expenses of operating the canals since last year of over $300,000 and an increase of about $250,000 in the net income. The total payments on account of canals (excluding the principal and interest of the canal debt) were in 1874 $3,842,892 35, in 1878, $903,347 02. The State prisons are advancing on the same road, the annual deficiency having been reduced from $704,379 85 in 1876 to $229,971 83 in 1878, and the prison at Sing Sing, which, when the Superintendent took charge of it, was in the worst condition of all, being now more than self-supporting. Some of the other public institutions of the State, it seems, might with advantage be brought under the same management, particularly the Inebriate Asylum, which the Governor says is a "complete failure." There being no compulsory confinement there, and consequently no patients who go there except voluntarily, the asylum has become "a hotel for the entertainment of wealthy inebriates," who "remain there so long as they find it pleasant and agreeable," and no longer. With regard to education, the Governor is opposed to the taxation of the public at large for the support of high-schools and colleges, as he is also opposed to the new Code and to the new Capitol, which he says will cost $20,000,000. He denounces the refusal of the Legislature to reapportion the State, and the interference of the Federal Government in the guise of "Johnny Davenport" in elections. With regard to the influence of the new Capitol upon the Legislature, he expresses the hope that the beauty of the architecture may improve its moral tone, and declares that if no such effects appear, and the vices of bribery and corruption shall "soil the new chambers," as he intimates they "too often marked the legislation of the old building," the people will have cause to regret its erection, and "to wish that the earth might open and swallow it up."

The proceedings against the County officers have made further progress during the past week. One of Mr. Gumbleton's objections to showing his books to the Committee of the Bar Association

was that they did not make the request simply as citizens wishing to see books, but as members of a self-constituted investigating body. It is difficult to know exactly what the distinction is, but to remove all pretext for this ground being taken, one of the members of the Committee has now, as a citizen, called upon Mr. Gumbleton to show his books, and Mr. Gumbleton has refused. His refusal, it is supposed, may lay the foundation for new proceedings. The scandalous character of the County Clerk's behavior is heightened by the fact that he was, before his accession to his present office, for a long time Deputy County Clerk, and has been throughout thoroughly familiar with the duties of the position. The Register, Mr. Loew, has replied to the charges preferred against him, and the Governor now has the case under consideration. His defence is generally that on taking office he was unfamiliar with the legal scale of charges, that he consequently directed his deputy to make the "proper" charges; that he always supposed the scale fixed was legal, that he never heard any complaints until September, 1878, when, before any investigation was begun, he immediately examined the law, and directed that no other than strictly legal fees be charged.

The second week of specie payments by the U. S. Treasury passed even more quietly than the first, and the Treasury continues to be the gainer rather than the loser of gold by resumption. Now that the Treasury is paying such of its demand debt, made legal tender, as is presented for payment, there is a great rush for its long-time debts, and the sales of 4 per cent. bonds continue enormous. One bank, the First National, has subscribed for $25,000,000 since the new year came in, and another New York bank, the Continental National, has taken $15,000,000. Altogether the banks have taken between $70,000,000 and $80,000,000 of these bonds, and the Treasury in less than two weeks has been able to notify the holders of $70,000,000 of 5-20 6 per cent. bonds that it will redeem them out of the proceeds of sales of 4 per cents. This extraordinary rapidity of refunding was unexpected even by the most sanguine, and the holders of bonds as remote in the order of redemption as the 10-40s have been selling them on the theory that they will be redeemed within two years. It is something gained that the annual interest charge should be reduced one-third on so important a part of the public debt. Nevertheless, the rapidity of refunding is regarded as not altogether assuring in another respect, which is the effect on the foreign exchanges. It is estimated that of the 5-20 6 per cents there still remain in Europe not far from $50,000,000, and these must, of course, be returned here if notified for redemption. None of the 4 per cents. are sold in Europe, and, accordingly, the demand for bills on London is largely increased. This demand, accompanied with a scarcity of commercial drafts in the market, has advanced the rates of sterling during the week to within one point of that which draws gold from here. Although the Treasury could stand a considerable drain of gold, all concede that in the early months of specie payments such a drain would be most unfortunate. At the New York Stock Exchange it has been a week of activity in railroad investments and of buoyancy in railroad stocks subject to speculation, and the money market was easier than for many years. Silver in London advanced from 49½*d.* to 49⅝*d.* and 49¾*d.* per ounce. At the close of the week the bullion value of the 412½-grain silver dollar, which had been $0.8353, was $0.8391.

The news from England is still a dismal story of decreasing trade, of unsuccessful strikes, of severe and increasing distress, and of terrible storms, with an inevitable decline of interest in the "imperial policy" and in all foreign questions. The omission of all mention of the suffering at home in the royal speech at the opening of Parliament, followed by the astounding proposal to vote money for the relief of the Turkish refugees in the Rhodope district, has infused fresh bitterness into the growing hostility to the Jingo Cabinet. It makes people feel as if they were as crazy about the Turks as they have shown themselves to be about the Russians. We were mistaken a fortnight ago in saying that a Liberal had succeeded a Tory at Bristol. What happened was the election of a Liberal by a much increased majority, with a corresponding decline in the Conservative vote. In Afghanistan the invaders are having it all their own way, barring some trouble with the mountain tribes, who do not like being invaded and are severely chastised for their discontent. A charge of Punjab cavalry killed three hundred of them the other day, the Bishop of Gloucester will be glad to hear, as, according to him, it will help "the advance of the gospel" in India. Candahar has been occupied without resistance, and Yakub Khan is in full possession of what there is left of Afghan government. The *Herald* reports that his father has been invited to Tashkend by General Kaufmann.

The news from Germany seems to show that Prince Bismarck is losing his head a little and drifting back into the condition of Junkerism and hostility to middle-class sentiment which he occupied before 1866. He has spread consternation among the German Liberals by publishing the outlines of a bill which he proposes to introduce at the coming session of the Parliament, making words spoken in debate triable and punishable by a Commission composed of two vice-presidents and ten members of the Reichstag, who would meet at the order of the President or on motion of twenty members. A member convicted by this tribunal of using improper language would be liable to public reproof or to be called on for a public apology or to be suspended, and if the suspension were for an entire term, to be made ineligible for re-election, and these penalties would not preclude prosecution before the ordinary courts. The object of it is to prevent the Socialists using speeches in Parliament, as they did last session, for the dissemination of sentiments which they did not dare to utter out of doors, but in practice it would, of course, make all freedom of debate dependent on the President and the Commission. Strange to say, the prevailing opinion seems to be that the bill will pass, so great is the Socialist panic and so thoroughly is Bismarck still master of the situation, in spite of the strong condemnation of the Liberal press. The police are enforcing the Anti-Socialist Act with great rigor, and especially that most terrible feature of it—the power of arbitrary banishment.

The Federal Council of the German Empire has appointed a special commission to revise the tariff, and Prince Bismarck has seized the opportunity to express his own views on the course which should be pursued. In his letter to the Commission he insists strongly on the advantages of indirect over direct taxes. Throughout a great part of Germany the direct taxes almost amount to confiscation, and the middle classes, composed chiefly of persons living on small and fixed incomes, are assessed, he says, beyond their strength. Direct taxes, too, are always the most disagreeable to the payer. A fixed amount paid by each individual, and collected if necessary by force, is far harder to bear than an indirect tax which depends in amount on the economy of the individual, and which is contained in the price of articles consumed. In considering the revision of the tariff, the Chancellor urges a return to the principles of protection. He wishes all articles brought into Germany to be liable to duties, except raw material required for home manufactures. He does not consider the question whether a system of free-trade, if universal, would redound to the advantage of Germany; but seeing that other nations have not adopted that system, and still surround themselves with a barrier of tariff laws, he thinks that Germany will best consult her interests by doing the same. The Chancellor's protectionist opinions are not new, though they seem to have gained much strength since his failure to induce Russia to modify her tariff in favor of Germany. Nor does he shine as a political economist; he probably cares little about either free-trade or protection, but he wants more money for the Federal treasury, and, since his defeat on the tobacco monopoly, despairs of getting it through direct taxes.

THE BURNSIDE ARMY BILL.

THE bill to reduce and reorganize the Army, lately introduced by the Joint Committee constituted last session to harmonize the conflicting views of the Senate and House of Representatives, is alarming in size as well as in some of its contents. It contains 724 sections, some of them with many numbered clauses, and fills 294 pages of royal octavo, being, as printed, about the bulk of an average volume of Statutes-at-large, comprising the whole national legislation for a long session. The concluding paragraph expressly repeals over two hundred sections of the Revised Statutes relating to a great branch of administration, the growth of a century. What the Committee offers in place of them will disappoint the ultra-economists who clamor for a material reduction of the Army, as its effect is by no means so marked in that direction as in its radical change of authority, division, and arrangement.

The two comprehensive reductions, each of them professedly final, that have been made in the regular Army since the civil war have fallen chiefly upon the line, leaving the staff comparatively intact, and it is contended that the latter has become disproportionately large. While there is some truth in the argument, so far as it applies to a common share of the personal hardship rendered necessary by economy, it must be remembered that the more important staff corps are not employed for the administration of the Army alone, but for the military establishment of the whole country, as well as for some of its most material interests. The legitimate work of the Engineer Corps would be about the same if the enlisted force of the Army were one-tenth or ten times its present number. The Ordnance Corps provides for the general national defence, only about one-sixth of its duty being in reference to the Army proper, the remainder concerning fortifications, State militia, and the preparation and care of the best material of war to meet the emergencies in which Government would otherwise be unarmed or at the mercy of swindling contractors. Constant efficiency in the Quartermaster and Commissary Departments also requires experienced officers to permit the sudden expansion of an army beyond the peace establishment; and their minimum strength, as well as that of the Medical Corps, even in the most profound peace, should be calculated not by the number, but the distribution, of the troops. A very large army stationed compactly in a small territory needs few staff officers compared with a small army scattered in multiplied subdivisions over an immense area.

The object of a military organization, however, is not simply defence or attack, but also the cultivation of military science. If there were absolutely no enlisted men, it would still be desirable to train officers, as in the German *Kriegspiel*, with wooden puppets and tin cannon; but live men and real arms are more useful. Nor is the discipline of troops by any means the whole lesson to be learned, their supply and maintenance being of at least equal consequence; and a trained staff, with judicious differentiation, is as important as are commanders versed in tactics and strategy. These facts are not wholly disregarded in the bill, which indeed but slightly reduces the numerical strength of the staff as a whole, but it does not preserve the essential feature of scientific selection and specialization. When civil-service reform is advocated through the success of the prevailing military principle by which faithful and trained officers are retained for life in their several specialties, it is surprising that the model itself should be so imperfect that, for one instance only, thirty-nine ordnance officers are to be cut off for no apparent reason except that thirty artillery officers should take their places, thus injuring both those branches of the service, while inflicting needless hardship upon the more scientific one.

The fundamental idea of the reorganizing sections of the bill is that every major, captain, and lieutenant who may be in favor is as fit for every kind of duty as any other officer of the same grade, and that staff duty is simply a privilege to be enjoyed in rotation, much as the other customary privilege of leaves-of-absence. The better results of the German system of inter-convertibility of line and staff are not secured, though it is provided that details from the line are to act as staff officers for certain periods, while many of the trained and experienced staff are turned out of the Army altogether or mixed in the line, where the special talents for which they were selected, and their experience gained, would be lost. In the actual working of the proposed inter-convertibility it will probably be found that the whole personnel of the officers of the Army will be shuffled together as if for "a new deal"; and even if there be not already a pre-arrangement of desirable offices by an army ring, to which the activity of the military lobby at this moment gives an air of probability, yet in the scramble there will be opportunities for both favoritism and malice on a great scale, never contemplated when the present definite commissions were accepted under the contract of law and established custom.

If it is determined to reduce the number of officers, the staff should bear its proportion of hardship, but no more, and not be disorganized to the injury of the service for the benefit of the line. If Congress decide upon any percentage of reduction, let it be impartially applied to all grades of all departments, corps, and arms. The true plan, which will not inflict injustice, is to open the retired list for officers of extreme age and those physically disabled, to offer a fair gratuity for voluntary resignation, and to stop all appointments and promotions to all grades until the established maximum in each shall be reached by casualty. This simple process will accomplish the object in two or three years, with easy adjustment and only such suffering as, being common to all in commission, would be cheerfully endured.

Turning to the features of the bill which have a public rather than a professional interest, we find the most important to be those affecting the relative powers of the constitutional Commander-in-Chief and his proper representative, the Secretary of War. In all well-organized free governments the military power and resources of the state are, as a rule, held in strict control by civil authority, in the shape of a ministry of war. The chief magistrate, under the restrictions of or in union with a co-ordinate branch of the government, appoints and commissions officers, and through his war-minister assigns them to proper duties. The military forces are commanded by officers assigned to and relieved from duty by the Administration at its discretion, and act under instructions from the War Office, being empowered by articles of war adopted by the legislature to enforce obedience and discipline among their subordinates. This system is maintained not only in time of peace, but in all wars in which disasters do not compel a resort to desperate courses, such as the establishment of a dictatorship.

The bill we are discussing, however, greatly increases the power of an office now unknown to law, styled "the Commanding General," and diminishes the control of the Administration not only over the military forces but over the national military establishment and resources. It vests originally in this General powers now simply delegated to the General of the Army (or the general who may be in command) by the President under his proper authority, and which might under the same authority be resumed; the only check left to the executive being in a new assignment as Commanding General out of the small number of general officers in order to find, if possible, one to execute his orders. Even if the serious and unusual experiment should be tried of placing a junior officer in command, it might well be that the President would gain nothing by the change, as all the eleven (to be reduced to six) generals in commission might hold the same views of policy or politics. The possibility of such a combination is foreshadowed by the concerted action of several of those officers in regard to the pending bill. The section (75) which defines the functions of the Secretary of War is carefully drawn so as to present the show of retaining legal authority in his office, by the words "shall exercise supervision and control," etc. The succeeding section, however, gives the General of the Army "*command* of the entire army, line and staff"; and by numerous other sections the nebulous "supervision and control" in the one declaratory section are both in spirit and in terms essentially modified by the specific provisions for "command" by the General.

Some of these may be mentioned. Section 82 requires all orders

relating to military operations, stations, movements of troops, etc., whether originating with the Commanding General or directed by the President or Secretary of War, to be issued from the headquarters of the army. There is an historic example of the operation of a similar law at the time when Johnson was President and Grant General of the Army. The latter was expected by the majority in Congress that passed the law for that purpose to defy, and did defy, the constitutional power of the Commander-in-Chief, as did the local military commander at Washington, and they were both sheltered by the act of Congress, the President being powerless. The constitutionality of that act has always been questioned, and, the party occasion having passed by, it was repealed. Though some politicians may have justified the temporary expedient to restrict the power of President Johnson at a particular crisis, few will knowingly advocate a permanent statutory permission to all Commanding Generals to disobey all Presidents. Section 83 is the complement of its predecessor, providing in effect that all correspondence from subordinates shall pass through the hands of the Commanding General before reaching the President and Secretary of War, thus enabling him by suppression or misrepresentation to leave them in any degree of desired ignorance as to the true situation of affairs, and so securing the permanence of the power before gained.

Section 120 requires that all details for duty in the staff shall be made by the President from nominations submitted by the Commanding General. The Secretary of War is ignored, and the Commander-in-Chief is confined by law to the choice of such officers as may be selected by his subordinate. When it is observed that all disbursements are made and all the civil functions of the War Department performed by the staff, some idea may be formed of the power over civil and administrative affairs placed in the military commander through the selection of his favorites in the first instance, and the "command" of them ever afterward.

Section 129 allows the Commanding General to assign "temporarily" commanders to the geographical divisions and departments in the absence or disability of those designated by the President. He can order any commander to Washington or elsewhere on some pretext and then assign a successor of his own choice "temporarily," and extend the absence of the former commander indefinitely, so as to obtain direct power over all departments and divisions—that is, the whole territory of the United States. These commands have political significance and aid the civil policy of the Administration, which hitherto has designated such officers to them as would cooperate with its wishes, whether concerning hostile Indians, bordering nationalities, or other sources of disturbance. If the General and President should differ in their views of public policy, as has happened, the former could thwart the views of the latter at an important crisis. This section should be collated with Section 84, which makes the geographical departments and divisions embrace all officers and troops, regular, volunteer, and militia, within their respective bounds, thus giving absolute control of all fortifications, arsenals, depots, and material of national defence and offence, including vast amounts of money and property, to the General and his possible selections.

Section 206 entrusts the Commanding General with the direction of the recruiting service; he should command the army, but not raise it. When there is a large amount of recruiting—raising questions of State rights, drafts, bounties, quotas of militia and volunteers, and other grave matters of administration—the subject is surely in the exclusive province of the political officer, and the anomaly, if not danger, of entrusting it to a soldier perhaps inflamed by the passions of party conflict, is obvious.

A centralization of all powers in the Commanding General, less specific but similar to that now proposed, was once brought about only a few days after the present General of the Army attained that rank vacated by President Grant's election. Then, a general officer being Secretary of War, the same who is credited with drafting most of the present bill, a general order was issued embracing some of the prominent features of the bill; but when General Rawlins, who was then a civilian, though thoroughly versed in military affairs, became Secretary the order was promptly revoked, the uncontradicted report at the time being that he informed the President that he would resign rather than be a mere clerk to the General of the Army, and that General Grant at once saw the vital errors in the order he had before inconsiderately sanctioned. Since that revocation some of the general officers have been astutely and persistently working for the acquisition of arbitrary command, and have to a large extent been checked in their attempts to impose upon the several Secretaries by the judicious and intelligent advice of the successive Judges Advocate-General. There seems to be a significant preparation for a struggle between "control" and "command" when Section 715 prohibits the Judge Advocate-General, or any other officer doing duty in the Bureau of Military Justice, from giving to the Secretary any legal advice touching his rights and duties. If the civilian Secretary should, in his temporary incumbency, attempt to defend the integrity of his office, he would, indeed, depending wholly upon the advice of the Attorney-General—another civilian, to whom military details are meaningless—fight a losing battle with the military chieftain whose subordinates alone would be allowed to surround the War Department.

THE REPUBLICAN BURDEN IN FRANCE.

THE Senatorial election in France, which has put the Government at last firmly in possession of the Republicans, has created great anxiety to know what they will do with their victory, and a speech delivered by M. Gambetta at a dinner given him by the Commercial Travellers in Paris has been eagerly perused with the view of discovering what the policy of the Government is to be. In this very speech, however, he reiterated his firm determination not to take office, and it is considered so important that he should not that it may be said without exaggeration that one of the most important points in the Republican programme is that Gambetta is not to have an office. The reason of this is that he has not quite outlived the reputation acquired during his dictatorship in the war for recklessness and impassioned partisanship. M. Thiers, in styling him in one of his speeches after the peace a "raging madman," probably expressed the feeling of seven-tenths of the French people about him. But there have been few cases in history of more rapid recovery from a certain kind of discredit. For the last seven years he has been steadily gaining in influence through the remarkable power of adaptation to circumstances, and of education through circumstances, which he has shown himself to possess. He occupies a position in French politics at this moment for which it would probably be difficult to recall any parallel, except (though *longo intervallo*) that of O'Connell in his best days in Ireland, and which is full of inconvenience. Indeed it may be said to constitute one of the difficulties of the Republic. He has obtained complete control of his party, and yet his party, though strong enough to take and carry on the Government, dare not give him office, so surely would the vast body of timid Conservatives whom the Republic has still to reassure regard his accession with a certain vague alarm. The first thing it has to say, therefore, on coming into power is, that Gambetta is not to be a member of the Government, and Gambetta has himself to repeat this; but in the next breath he gives what the whole country regards as an authoritative exposition of what the policy of the Government is to be. He is himself completely reconciled to his position by his youth—for he is only forty—and by the fact, to put the matter on the lowest ground, that to the career he undoubtedly expects to make the firm establishment of the Republic is essential.

The inconveniences of having the power lodged in hands which are not subjected to formal or regular responsibility are obvious enough. It, in the first place, in a greater or less degree discredits the Ministry. They wear in the public eye the air of being Gambetta's subordinates, or at all events of holding office by his permission, which of itself has a somewhat paralyzing effect. In the second place,

it destroys or weakens the public control over party policy in the Legislature, inasmuch as it surrounds every measure of importance with doubt as to the real authorship. Before the late election the Ministry derived a certain weight and authority from the fact that they seemed to form a sort of buffer between the Assembly and the Senate, or, at all events, an instrument by which the Senate could be induced to work harmoniously with the Assembly; but these the late election has destroyed. There is no longer any need of conciliating the Senate. It has come to pass that, to use our well-known phrase, Gambetta will now "run" the Senate as well as the Assembly; he does not any longer need the ministerial stamp to guarantee the safety of his plans. He, therefore, now talks with more authority than ever.

The speech at the Commercial Travellers' dinner, however, really announced nothing new except what may be considered a formal repudiation on behalf of the Republic of the old Rousseau idea of which the first Republic, and, indeed, that of 1848, was enamored, that it was possible to construct *à priori* a government which any nation could live under. An original French Republican scorned to construct a constitution for a particular nation; he made it for the human family, and the Chinaman and the Red Indian would be just as comfortable under it and could work it just as well as the Frenchman or Englishman. The desire to give other nations the advantage of it by force was a not unnatural consequence of the fanatical belief in its universal efficacy, and has hitherto shown itself prominently in all French Republican movements, in the form of a solemn recognition of what was called the "solidarity of the peoples." A spirit of propagandism was thus created which even the downfall of the Republic by no means extinguished. It survived in the various monarchical régimes, though expending itself on various objects. It imbued French politicians of all schools with the notion that France was responsible in a marked degree for the political condition of all the countries around her, and gave the conceit of "making war for an idea" an air of splendor, though the "idea" which was considered worth war varied greatly from decade to decade. M. Gambetta repudiates this propagandism with much earnestness. He says the business of Frenchmen is to found and maintain a government that will suit themselves; that they are not responsible for other people's governments, and will do well not to trouble their heads about them. But he acknowledges, in his happy, epigrammatic way, that though the period of "danger" for the Republic has passed away—that is, the period in which there was reason to fear that some other régime might be set up by force—the period of "difficulty" has come. By this he means that expectations will now be entertained about the Republic which have not been entertained previously because it was not in full possession of power, and that attempts will be made to realize these expectations by forcing the Government on new and dangerous paths. In other words, the Republicans will now be called on in a way they have never been called on before for a display of their conservative or resisting power.

The extreme Left already shows a disposition to bolt from the control of Gambetta and form an independent section. At a late meeting of the Republican Deputies in Paris M. Floquet called for a reorganization of the Cabinet, and M. Louis Blanc is said to be preparing an address on behalf of this wing of the party calling for a Government programme of a very extreme character. The danger of these schemes, and of all schemes concocted under these auspices, is that if they took effect on the Cabinet they might force or frighten Marshal MacMahon into resigning, and there would be considerable difficulty in finding a substitute for him. He is docile enough since his late defeat, up to a certain point, and commands the respect of the army and of the country for his military services, and furnishes what has been very useful to the Republic during the first year, a good figurehead for state ceremonies. It would be very hard to fill his place with any civilian in a manner satisfactory to the mass of the population. The tradition that the chief of the state must be a soldier, at least technically, as all kings are, is still very strong in France, and if an exception were made it would have to be in favor of a civilian as distinguished and with as many holds on popular confidence as M. Thiers, and civilians of this kind are not easy to find; so that it is clearly the part of wisdom for the Republicans to keep the Marshal as long as they can. But they will doubtless be obliged to carry out the reforms among the judges and the higher military commanders which M. Dufaure has already half accepted, and of which the recently-announced resignation of General Borel, the Minister of War, is probably the first sign. Even the moderate Republicans will never be satisfied until the corps at least, if not the divisions, are commanded by their own men, and the more advanced are just as eager for what they call the purification of the judicial bench. This last is, however, a hazardous task. It cannot yet be said with absolute confidence that "the era of revolutions" is closed, and it would be a tremendous misfortune if the victors in the next convulsion were to find a precedent for looking on the judiciary as "spoils."

THE LAST INVASION OF AFGHANISTAN.

I.

THERE is hardly a more romantic chapter in modern history than the conquest of British India, as all readers of Macaulay's Essays know, and yet the romance did not cease with the firm establishment of the Company's dominion. The work of extending and organizing and defending it during the last fifty years has been filled with episodes almost as brilliant as Plassey and Assaye, and the arena has never been without soldiers whose career and exploits seem to belong rather to the wars of Roland than to those of Moltke. The overthrow of the Beloochees, the campaign in Afghanistan, the fight with the Sikhs, and the great Mutiny are crowded with incidents in which Froissart would have delighted, and which illustrate the wonderful fertility of resource, the dauntless courage, and the unconquerable determination which are brought out in men of the Anglo-Saxon race by adverse fortune, under strange skies. No decorations are so full of meaning as those bestowed for Indian campaigns; they tell the "tales of many a glorious hour—

> "Of deeds in field or trench,
> Of crumbling fortress held
> When stoutest heart might blench
> And bravest hope be quell'd."

The Afghan war, begun in 1839, was one of the most striking of these episodes, and was, except in the tragic fate of the first army of invasion, an excellent illustration of Anglo-Indian political morality and capacity, and deserves far more attention than it has received for its remarkable resemblance, both in its origin and inception, to the contest now raging in that country. The whole story has filled many volumes of history and biography, but our present object is simply to sketch the two most striking incidents of the war, the retreat from Cabul and the defence of Jalalabad, so that we shall not attempt more than a mere outline of the situation which led to it.

In 1839 there was a sort of panic in India, not unlike the present one about the advance of the Russians in Central Asia, and the Persians were besieging Herat, the great fortress of Northern Afghanistan, it was believed under Russian instigation. The siege lasted some months and was watched with the keenest interest all over the East. The Persians were finally repulsed, after several desperate assaults, mainly owing to the exertions of a young Anglo-Indian officer, Eldred Pottinger, who had thrown himself into the place and superintended the Afghan resistance. The failure in no way quieted the fears of the Indian Government, however. Lord Auckland, a man of the Lord Lytton type, was then Governor-General, and during the siege he was up in the Himalayas at Simla, away from his older and steadier counsellors and under the influence of three comparatively young and very restless and ambitious members of the civil service, William MacNaghten, Henry Torrens, and John Colvin, who, to make a long story short, persuaded him that Dost Mohamed, the then Amir of Afghanistan and father of the present Shir Ali, was not to be depended on or controlled, and that the only way to make Afghanistan a barrier against Russian aggression was to put somebody on the throne of whose fidelity and subservience to British interests there could be no doubt. Such an instrument they found ready to their hands in the person of Shah Soojah, who had some years before been Amir, but had been expelled by a rising of the dominant faction of Afghan chiefs in the interest of Dost Mohamed, and was then living, old and feeble, as a refugee in British territory. They accordingly fished him out of his obscurity, acknowledged him as king,

made him enter into an alliance with the Sikhs, then ruling in the Punjab, and collected a force of about 15,000 men, 4,500 of them Europeans, to reinstate him at Cabul. Lord Auckland then issued a manifesto denouncing Dost Mohamed in much the same terms in which Lord Lytton now denounces Shir Ali, and declared that "so long as Cabul remained under his government we could never hope that the tranquillity of our neighborhood would be secured, or that the interests of our Indian Empire would be preserved inviolate." MacNaghten then was commissioned to accompany Shah Soojah as "envoy and minister on the part of the Government of India." The invasion began, to use the eloquent language of Kaye, the historian, "in defiance of every consideration of political and military expediency; and there were those who, arguing the matter on higher grounds than those of expediency, pronounced the certainty of its failure, because there was a canker of injustice at the core. It was indeed an experiment on the forbearance alike of God and of man; and therefore, though it might dawn in success and triumph, it was sure to set in failure and disgrace."

It did, indeed, like the present war "dawn in success and triumph." The march on Cabul was made not by the Khybar Pass, which was left to the Sikhs, but by Candahar, which was occupied without resistance, and on the 21st of July, 1839, the British force, under Sir John Keane, arrived before the fortress of Ghazni, ninety miles from Cabul, and met with the first serious opposition. The general had pushed on rapidly without waiting for his heavy artillery, and found the place so strong that it was useless to assail it with his six and nine pounders, and he resolved on carrying it by assault after blowing open one of the gates with gunpowder. This desperate enterprise was successfully carried out. The storming column rushed in at daybreak over the débris, and engaged at once in a hand-to-hand fight on the streets with the amazed Afghans. Dennie, one of the famous Indian officers who afterwards fell gloriously at Jalalabad, led the advance, supported by Sir Robert Sale, then a man of fifty-seven, who plunged into the mêlée with the eagerness of twenty-five. He had a narrow escape in a desperate encounter with a powerful Afghan, in which both combatants rolled over and over among the broken beams of the gate, before Sale, wounded as he was, got the upper hand and clove his enemy's skull. The struggle did not last long, however; the tulwar and the jezail, though backed by fierce fanaticism, were no match for the bayonets, the rolling fire, and the steady discipline of the British column, and the slaughter of the defenders was great. Five hundred were buried by the victors, who lost seventeen killed and one hundred and sixty-five wounded. Dost Mohamed, on hearing the news, marched out from Cabul for a last effort in the open field; but his levies were raw and treacherous and disheartened; they went to pieces, and deserted him before they saw the enemy. He was a gallant soldier, and it is recorded that he made a touching appeal to the remnant of his cavalry to stand by him in one charge on the infidels, in which he could die with honor, and then they could make what terms they pleased with the invader. But it was all in vain. They not only disbanded but plundered his tent before going, and he turned his horse's head sorrowfully and fled towards the Hindoo-Koosh, the great mountain range.

Cabul was then occupied without resistance, but the inhabitants looked on the entrance of the new monarch with cold indifference, and MacNaghten was satisfied, before he was a month in the place, that his protégé, Shah Soojah, had no hold on the people under any circumstances, and that coming back as he was doing, under the protection of infidel guns, he was looked on as a detestable usurper; that the British troops could not be withdrawn as had been originally intended, and that they must occupy the country, and carry on the government in the Shah Soojah's name, but nevertheless through his officials, who were as corrupt and degraded as oriental officials usually are. The invading force was therefore cantoned in various places, a strong garrison being retained in Cabul. The whole was then under the command of Sir Willoughby Cotton, who had succeeded Sir John Keane; but when the prolonged occupation was determined on he retired on the ground of ill-health, and was in turn succeeded by General Elphinstone, whose appointment by Lord Auckland was the extraordinary feature of the expedition. Elphinstone was already an old man in infirm health, of but little Indian experience and no military fame, well born, a good diner-out, and passionately fond of London society, which he had recently left, and was constantly recalling, with regret. He had apparently, until the last dreadful days, no sense whatever of the gravity of his situation. The troops settled down in their quarters, however, with considerable cheerfulness. The climate was bracing, and the country around beautiful and full of game. The officers brought on their wives and daughters from India, and took houses in the city. The Afghans seemed to like their money, and were entertained by the hunting, shooting, and skating. That great discontent was abroad in the country was plain enough, but nobody considered it formidable. The chiefs were constantly rising here and there, but were easily put down. Dost Mohamed had raised a force of the Uzbeck tribes up in the mountains, but had been defeated, and had in despair surrendered himself to the British envoy and been sent to India, where he lived on parole with a pension. The winter of 1840–41 was reasonably quiet, and General Elphinstone was enjoying his whist and telling his stories with such placidity that he took no precautions whatever for the safety of the force in Cabul. They were quartered in cantonments on low ground, with feeble or ruined defences, and were commanded on every side by hills, forts, and villages, and, to crown all, the supplies were stored in a small fort outside the lines, the communication with which could be easily swept by an enemy's fire. The occupation had reached the autumn of 1841 with things in this condition; but a cloud had arisen which, small as it seemed, had in the East a tempest in it. What had raised it we shall describe in Kaye's own words:

"I am not writing an apology. There are truths which must be spoken. The temptations which are most difficult to withstand were not withstood by our English officers. The attractions of the women of Cabul they did not know how to resist. The Afghans were very jealous of the honor of their women; and there were things done in Cabul which covered them with shame and roused them to revenge. The inmate of the Mohammedan zenana was not unwilling to visit the quarters of the Christian stranger. For two long years now this shame had been burning itself into the hearts of the Cabulees, and there were men of note and influence among them who knew themselves to be thus wronged. Complaints were made, but they were made in vain. The scandal was open, undisguised, and notorious. Redress was not to be obtained. . . . The injured began to see that the remedy was in their own hands."

On the night of the 1st of November, 1841, a conspiracy for a rising in Cabul, which had been long on foot among the Afghan chiefs, was brought to a head, and the next day fixed for the outbreak, and it took place accordingly. A furious mob murdered some of the British officers, plundered the royal treasury, and, reinforced by armed crowds from the country districts, occupied the most commanding positions in and around the city. The garrison was taken completely by surprise, and General Elphinstone was so reduced by gout and rheumatism and old age that he was utterly bewildered. The insurrection was assailed by small parties of troops, who were repulsed and accomplished nothing. Fighting raged during the whole of the month with varied fortune, the British trying to hold the cantonments and the Bala Hissar, or citadel, on which the royal palace was situated, but short of artillery, ammunition, and provisions, losing men and courage in desultory frays, practically without a commander, and the surrounding country constantly pouring in fresh levies to attack them. Castles, villages, forts, and ditches swarmed with sharpshooters, who harassed them night and day. The losses were great, and by the first of December hope was gone, and negotiations were opened with the enemy for permission to withdraw to Jalalabad, then occupied by Sale at the other end of the Khoord Cabul Pass, on the road to Peshawar. The provisions were nearly exhausted and the troops utterly demoralized. Both Europeans and Sepoys ran away from the enemy without the slightest shame.

A convention was therefore concluded by MacNaghten with the Afghans, by which the whole country was to be evacuated, the Cabul garrison was to go to Peshawar, taking the king with them, and were to be supplied and safe-conducted on the road. But the negotiations took three weeks, during which the Afghans treated the British as conquered enemies, and inflicted on them the grossest insults. On the 18th of December the snow began to fall. On the 23d it was still questionable whether the force would be allowed to depart after all, so tricky and temporizing and insolent had the enemy become. On that day MacNaghten rode out, by appointment, for a final interview with Akhbar Khan, Dost Mohamed's son, and while debating the English party was suddenly surrounded, seized, and MacNaghten, resisting, was shot dead by Akhbar Khan himself, his body carried in triumph through the streets of the city, and hacked to pieces. Fresh negotiations were then opened and a new treaty signed by eighteen of the Afghan chiefs, under which the British literally surrendered at discretion. They agreed to pay a large sum as ransom, to give up their artillery, and to leave some of the ladies as hostages, and submitted all the while to humiliation of every kind. Finally, on the 6th of January, 1842, the march began, 4,000 fighting men and 12,000 camp-followers starting out in the deep snow. They made six miles before night, hundreds sinking under the cold, all discipline gone, and the whole force resolved into a confused and despairing mass. It

took them two days to reach the entrance of the Khoord Cabul Pass, a dark and gloomy ravine five miles long, ten miles from Cabul, and as soon as they entered it swarms of Afghans posted on the heights began an indiscriminate massacre, and killed 3,000 of them, and Akhbar Khan carried off Lady Sale and her daughters, and several other ladies, with General Elphinstone, ostensibly for safe-keeping, but in reality as hostages. On the 10th of January the march was resumed and the massacre again begun. In the Jugdulluck Pass, a little further on, a barrier had been erected which they could not force, and here they were nearly all slaughtered. A few officers stood together and struggled on a few miles but were pursued and killed. One survivor—an army surgeon named Brydon, who only died last year—rode in, wounded, on a broken-down pony, to bring the awful news to Sir Robert Sale, who was holding Jalalabad with his brigade. What befell this little force we shall tell next week.

THE PARIS EXPOSITION.—XVI.

FRENCH AND ENGLISH HOUSE-FURNITURE.

PARIS, September, 1878.

CURIOUS is the comparison between the French and the English work in house-decoration and house-furniture. If we consider the more rich and decorative displays, the two nations are as wide apart as the poles in their aims and tendencies. The first sight of the long alley of the Paris *ébénisteries* is not so strange as the general aspect of the British quarter, beyond the open streets and the art-galleries. The French work is what one expects. It is not novel in design ; its extraordinary grace and delicacy, and the great cost and richness of many of the pieces, are not visible at first glance. The Londoners and their followers are not so old-fashioned. Something strange is going on in London ; if your interest is excited by the odd look of the sideboards, and the wall-painting and tiles, you find it hard to explain to yourself what it is that is at the bottom of this general movement toward novelty of design, and a style of work such as is certainly not slavishly copied from any epoch of the past. There is something characteristic of the two nations, or, at least, of the more thoughtful part of the two nations, in their ornamental work in these branches. The Englishmen seem to have received a direct revelation, and in their unskilful way to be trying to obey it ; they are intense and unanimous, they are all working alike with a definite object in view, and their designs are quaint and vigorous as are those of the creators of a new style, but not graceful, as a general thing, not refined into harmony—the work of clever youths rather than of mature minds. The Frenchmen have nothing to say to any novelties of design ; they are as far as possible from any enthusiasm such as is excited by the possession of a newly-comprehended creed which must be fought for ; they have no particular religion, but they get on wonderfully well without it. Their work is skilful and accomplished to a degree which no English workman can approach ; their mastery of their material is wonderful ; their grace, symmetry, elegance can only be hinted at, not fully explained. Detail, which the English workman never can manage, which bullies him, and obtrudes itself into his work like a spirit he has raised and cannot command, is for the Frenchman an obedient slave. The Frenchman's detail is a part of his design, and keeps its place ; his rival's is a separate entity, and is not often taught to help in the general effect, as it should. In short, the French are the more trained and more skilful artists ; but it is not necessary to state that truism very forcibly or very often—it will be admitted. What is strange is to see the vigor of the English in working out what may be a new artistic style, and, as such, an era in the history of art. It is sad to think that all the conditions are against any such result : that it is probably only a fashion that we see, and not a style—not because there is anything lacking in the thing itself, so far as developed, but that it is quite sure to be abandoned at a day's notice whenever the evil goddess, the Até of modern art, Fashion, may choose to give the signal. Styles develop naturally, one out of another ; what we are looking at now in the British department is almost a style, having developed itself out of the Gothic revival, and in consequence of modern impatience with that in Gothic which it could not easily subdue to its needs. Fashions change by caprice and suddenly, with no deeper cause than the whim of some royal personage or some successful tradesman.

The difference between the French work and the English can be best explained if we begin with the former. This is almost wholly of one type ; the French themselves are apt to say that it is all Louis XVI. to-day, but that is not quite correct. It is not Renaissance, for it is too light and fantastic for that ; not sufficiently grave, not sufficiently architectural and massive. It is not Louis XIV., but much more refined, having in it a sort of feminine grace unknown to that epoch. And yet it is not Louis XV. or Louis XVI. either, except in the light card-tables and slender chairs, and some of the silk-covered divans and lounges, which do rather smack of the boudoir and the salon of those dainty days. Some of the cabinets exhibited are of wonderful costliness and magnificence, and really seem to be worth their cost, and in these the prevailing style is to be described in some such words as these : The proportions and general character are French Renaissance ; the detail more delicate, and evidently studied from Italian work of the same epoch. French sculpture in wood of the time of the Renaissance—that is, of the reigns of Francis I. and Henry II., and his sons ; or for about three quarters of a century from the year 1515—is more generally in oak, and of a somewhat bold style and handling, as befits that noble material : it is, therefore, somewhat akin to the French stone-carving of the same period. But at that time the glory of the Renaissance was past in Italy, where it had begun earlier and moved faster ; the materials at hand and the character of the people, too, in the peninsula affected the style of work there very much. Instead of bold work in sandstone, delicate sculpture in low relief in hard and fine marble was the chosen architectural decoration of the day ; and in interior woodwork, inlays of wood and ivory, mosaic of hard stones, and sculpture as refined and subtile as the world has ever seen took the place of the bolder work of the north. Now, in this modern Parisian work these two methods are combined to a certain extent. The cabinet exhibited by M. Guéret, entirely in boxwood, is an instance of this tendency. The design is French, and in its purity and simplicity of form it is rather of the time of Henry II. than later ; though, of course, at all times there have been elaborate cabinets designed in this severe fashion, carefully classic and according to Vignola. But the sculpture certainly would not have been what it is but for the existence in Italy of the exquisite carved panels and mouldings of the sixteenth and seventeenth centuries. It is all in the pale-yellow wood, in very slight relief, and most admirably executed, erring perhaps on the side of minute finish, as if of a small casket of ivory or bronze, but in perfect harmony with the general design. This is by no means as costly a piece as some ; eighteen thousand francs is the price put upon it. A cabinet exhibited by M. Jules Allard has the panels in boxwood, but the frame in solid ebony—not "ebonized" cherry or maple, but the much more beautiful native wood, which is not jet black, but has lovely tints and half-seen gradations in its blackness. In this piece the sculpture takes great prominence, as there are statuettes in each of the two woods, the yellow and the black, and there is endless variety of design in the carved decoration : among the capitals of the little pilasters, the rosettes, and sculptured mouldings there are no two to be found alike. This is a remarkably successful instance of very rich and elaborate work retaining good taste and a general effect of simplicity and reserve.

In these pieces, and in pretty much the whole immense display of rich French furniture, this modern classic taste rules unquestioned. The style of the Renaissance and the epochs following that one are alone seriously considered. The influence of Gothic art, of Byzantine art, of the East in any of its varied artistic forms, is hardly to be detected in the more splendid pieces. The French designers are working just as they worked in the time of the first Empire ; modern eclecticism has influenced them no farther than this, that they are more careful of the purity of style, and mix their details and "motifs" less ; modern critical taste has influenced them only in this, that they are better paid, more honored and respected, and, therefore, chosen from a higher class and possessors of more cultivation and knowledge. No French designer dreams of an "Exhibition piece" in any but one of the modern-classic styles, nor have any of his predecessors for three hundred years, except here and there a bold experimentalist who knows, as he works at what he fancies Gothic or what he calls Chinese, that he is off the track, and that all the world will think so and treat his work as a mere vagary.

The work of the English designers for the past fifty years has been carried on under very different influences. In the first place, it is clear that at no time, from the death of Gothic architecture under Henry VIII. to the attempted revival of it—shall we say by Beckford and Horace Walpole ?—under George III. was there any such absolute agreement as to the only possible style of decoration as there has always been in France. If we contrast Elizabethan art with the "Style Henri Deux," from which it sprang, or Jacobean art with "Louis Treize," or the now popular Queen-Anne style with "Louis Quatorze," it will at once be seen how complete is the difference—how regular and systematic is the one,

how independent and even capricious is the other. It is one of the most curious studies possible, the absolute inability or unwillingness of the English designers to follow, like docile pupils, the classical styles of the Continent, to which any one of them would have avowed his complete adhesion ; and, with this, the steady and disciplined march of the French. But for the past forty years this English community, already individual even to excess, and deprived, for evil as well as for good, of an universally recognized standard of design, has been assailed by the most varied influences. The Gothic revival divided at one time all England, and about evenly, with the classical revival in the hands of Sir Charles Barry and others of like mind with him. But, also, as the details and the free use of color of Italian Gothic were brought in to help the native English Gothic, so Italian Renaissance came in through the study of the early painters, and of Majolica and stuffs of the time. Oriental ornament could not be disregarded, whether it were Moresque, borrowed at second hand from Spain, or true Arabic from Cairo, and, more recently, the wonderful charm of Japanese art began to be felt. All these influences existed for the French as well, but they were not felt in France as in England. For, see the result. In the British division of the long gallery of "Mobilier et Accessoires" there are few indications of purely classical feeling. Elkington's silverware is more nearly classic than any of the woodwork or decorative painting, except for here and there a separate piece. All the work is of one sort ; you can see it in Du Maurier's woodcuts in *Punch*, you can feel it in Walter Crane's charming designs, you have it in New York at one cabinet-maker's shop, at least, to the exclusion of all other styles, and at all the furniture-stores you see traces of it. Cool colors, half tints, sage-green, with oriental blues which are almost greens and greens which are almost blues ; much use of floral ornament painted in flat tints or slightly relieved with gradation, and firmly outlined ; much use of small-scale figure-design, the costumes those of the last century, at least in form, the colors brought into the general system as stated above ; gold backgrounds and gold outlines very frequent ; the influence of Japanese decorative work in color very general, although some of the best designers seem to be trying to resist it —these are some of the characteristics of the wall-painting which is now in the ascendant. Wall-papers are much used, and are designed upon the same principles ; in fact, wall-papers should be considered as a mere variety of wall-painting, fitted for inexpensive and unpretending interiors. Tiles are used for decoration to a very great extent, and in boundless variety ; but of this hereafter. The larger pieces of furniture are designed in a style which seems to be half way between modern Gothic and "Queen Anne." It is a style not to be despised on account of its mongrel parentage. The work of the better English furniture-designers for the past twenty years has been a not unsuccessful seeking after convenience and fitness for modern uses, while preserving something of the character of mediæval work ; their adoption or partial adoption of the Queen-Anne fashion or taste has been in a great measure in deference to practical utility; and the result is that the sideboards and chimney-pieces of to-day, which may almost be described as of Sir Charles Grandison's time but with details of Chaucer's time, are very convenient, very appropriate to their places and purposes, very domestic-looking, yet not lacking in a certain magnificence. The French have noticed this peculiar domesticity of the English house-fittings : they think it a characteristic of the people, and trace its analogies in the British pictures with their quiet scenes of home-life and meetings by stiles and under garden trees.

It is to be observed that these tendencies of modern English art toward subdued color, unarchitectural form, and a generally simple and domestic as opposed to a grandiose and palace-like treatment of their interiors, cannot be traced direct to any one origin. Japanese design and Japanese feeling have helped in this, for it is a very prominent trait of Japanese art that it ignores stateliness, and lavishes its lovely detail on the simplest objects ; moreover, Japanese design is never balanced and formal, and that can hardly be dignified and stately in European eyes which is not balanced and formal. The lack of great magnificence in the public buildings of England as compared with those of France ; the fact that the Halls and Manors of Queen Anne are less stately than the Châteaux of Louis XIV., and that by a great deal ; the comparatively domestic character of the architecture and appointments of the palaces of Great Britain as compared with Versailles or St.-Germain or Fontainebleau, all these have helped in determining the character of the new style. These questions of its origin, however, though interesting, are not important in determining the question of the value of the style itself. We find it now, in 1878, well understood and recognized as the ruling taste, a standard common to nearly all British designers.

This being so, great things might be expected from the English decorators, for it is an axiom in art that there must be an agreement of many men—of a whole community—as to methods of work and recognized aims, in order to bring out the best powers of each designer and to produce the best general result. And if this goes on long enough—this common consent, this working together in a style of their own creating—better things may be looked for than this century has seen in Europe. The style has the "defects of its virtues," of course ; if it is simple and domestic, as is right, it is also clumsy, beyond experience. These rationally-designed sideboards are not to be compared for grace of form and harmony of proportions to the French cabinets, and the misunderstood naturalism of their detail is far inferior in value as ornament to the delicate classic patterns of the Parisians. There is, too, an incomprehensible diversity in this work. Their wall-painting and wall-papers and much of their decorative glass are so good, why do they paint pottery so badly ? Why are the British earthenware and porcelain tiles generally so bad ? Why are the French tiles generally so effective ? The reason seems to me to be this : the English school has not yet gained such mastery over its chosen style of decoration as it fancies. In the boldest way it is seeking to cover ceramic-ware mantels, dados, door-pieces with figure-subjects of a complex character ; no other nation, in the heyday of its life and the fullest development of its art, has dared to do so much. The human figure, both nude and clothed, animals, plants, landscape effects—anything that can be painted with the brush—is spread over these earthenware surfaces, and fired, in the full confidence that variety and spirit will make up for all deficiencies. But the fact is that there are only a few painters of such things in England who have knowledge and power enough for these elaborate and original designs. The French, with a vastly larger number of strong and highly-taught designers, fully competent to put upon ceramic ware anything that the ungrateful material will receive, are yet much more timid. They have no new style of work they are developing ; they give us tile compositions in the Moorish style, in the Persian style, and are at peace. Now and then an immense landscape is painted on a surface made up of small tiles, but this is painted on exactly the same principles as a painting on canvas, and pretends to no decorative, as opposed to pictorial, character. Moreover, the French painters of landscape and figure are immeasurably more attentive to the decorative effect of a canvas than the English. It is their virtue, and, from some points of view, their failing, to care little for subject as compared with artistic effect. So that it is not a great effort for a French artist of ability and training to paint a huge landscape on three hundred square tiles, or a hunting piece on six hundred, and preserve a purely ornamental treatment.

I hope, in the next letter, to point out the workings of the same influences in other things, more particularly in silverware and glass. R. S.

Correspondence.

STEEL RAILS ON THE UNION PACIFIC.

To the Editor of The Nation :

Sir : In the notes of the week in the last issue of the *Nation* I notice the following statement, alleged to be taken from the recent report of the Union Pacific Government directors: "Only 29 out of 1,026 miles of the iron rails have been replaced by steel." A similar statement, I understand, was telegraphed to the Associated Press. The blunder may not be so obvious as to be unworthy of correction. I will therefore say that the mileage of steel rail really reported by the Government directors was 290, instead of 29. This, however, was in round numbers. To be exactly accurate, taking the return made to the Government directors from the office of the general superintendent of the road, on November 14, the "amount of steel in track and that ready to go in before year closes [was] 283 miles," laid as follows : "1870, 2 miles ; 1874, 12 miles ; 1875, 18 miles; 1876, 30 miles; 1877, 130 miles; 1878, 91 miles."

As few of those who have seen the summary will read the original report, you will do an act of justice to the Union Pacific and oblige the Government directors by publishing this correction.

C. F. Adams, Jr.

Boston, Jan. 13, 1879.

TRADE WITH SOUTH AMERICA.

To the Editor of The Nation :

Sir: Your correspondent "B.'s" assumption that trade is a barter of merchandise is true only if the term "merchandise" is meant to include

evidences of indebtedness ; otherwise the logical consequence would be that no nation could for any considerable length of time export merchandise to a greater value than its imports, or, in other words, that the balance of trade could not long remain in favor of the same nation, a proposition which the history of England's commerce shows to be untenable.

Our exports to South America—which, by the way, are not sold at ruinously low prices, but yield a fair profit to the manufacturer—will be paid for, as "B." observes, in bills of exchange drawn on Europe ; but the kind of merchandise which he seems to ignore, and which we can afford to import in large quantities in payment for those bills, will be the certificates of our indebtedness, United States, State, and railroad bonds, etc., now held abroad ; or, if preferred, we can be paid in consols, rentes, and similar foreign "merchandise."

The conditions of society which make actual barter necessary exist at present only in some of the interior countries of Africa, and in the minds of certain political economists.

Yours respectfully, H. S.

Boston, January 13, 1879.

[England is hardly the kind of illustration our correspondent needs, because she is not only a great manufacturing nation but a great investor of spare capital in foreign countries, which the United States is not. Moreover, there is no likelihood of any sensible demand here for consols and rentes, or other foreign securities bringing low rates of interest. The current rates of interest to be had here on perfectly safe security forbid and will forbid it. It is extremely probable, too, that after the revival of business our own bonds instead of flowing home will again begin to flow abroad, for the simple reason that comparatively few Americans will be content with four or five per cent. when they can, with peace of mind, get seven or eight. The domestic demand for our bonds at present is almost certainly abnormal and transient.—Ed. Nation.]

BISHOP FRASER.

To the Editor of The Nation :

Sir : The mistake made by the *Nation* in quoting the Bishop of Manchester's position on the Afghan question, in the number of January 9, seems more like a slip of the editor's pen than a compositor's error. Feeling a good deal as you say the Liberals among English Churchmen do on this matter, it seems to me you almost owe to the bishop the reparation of quoting the words of his letter to the *Spectator :*

"But for an attack of bronchitis . . . I should have felt it my duty to place myself by the side of the Bishop of Oxford, . . . so that he might not have seemed to 'stand alone' among the bishops in his judgment of a policy the motives of which I yet fail to understand, and the morality of which—if morality is still in any measure to regulate the intercourse of nations—I cannot approve. . . As a bishop of the Church of England I would not be thought indifferent, as by my absence from the division I might be thought, in a case where 'the path of truth and justice' is at least as much deserving of regard as the necessity, assumed by the *Times*, that, *per fas aut nefas*, 'we must make ourselves secure.'"

Very respectfully, etc.,

An American Churchman.

[We have, as might have been expected, received several letters on this subject. The error was a proof-reader's oversight in letting "ministry" pass for "minority."—Ed. Nation.]

THE PROPOSED YORK-ANTWERP RULES ON GENERAL AVERAGE.

To the Editor of The Nation:

Sir : Having noted the evident reluctance with which you have hitherto admitted into your valuable paper communications which even partake of a controversial nature, far more those of a *personal* character, I read with great astonishment the letter addressed to you by Mr. Gustav Schwab upon the subject named at the head of this. It seemed to me a little singular that after this matter had been three times brought before the Chamber of Commerce, twice discussed in public at length, a special meeting called for the purpose, and the fullest opportunity given for every one to be heard, this gentleman should have reserved all his arguments and thunderbolts to be circulated through your medium instead of advancing them in their proper place and time, where their weight, if they had any, might have been used in influencing action which he now deprecates, and the poor chairman of the majority have been spared the vials of his wrath. The real pain which I experience in being so completely misunderstood and misrepresented by so respected a gentleman is modified by the evidence which his communication furnishes that he has utterly failed to grasp the subject on which he writes (which is not to be wondered at), and, dissatisfied with his own reasonings, has been driven into that *dernier ressort* of arguers—personalities. Feeling quite sure of my own position and motives, I shall not be driven to the same weapons. The reports of the proceedings of the Chamber of Commerce being very meagre as given by the daily papers, the communication you have published is calculated to convey a very erroneous impression both of the report of the committee and the action of the Chamber ; and as your paper circulates amongst and influences the highest intellectual class of our nation, I should feel that the work of the committee was very imperfect were we to suffer it to pass unnoticed.

Briefly, then, this entire question arises from one branch of those International Conferences inaugurated about twenty years ago, under the management at that time of Lord Brougham. Among the subjects deemed worthy of consideration was that of "General Average," or those broad rules governing the extraordinary expenditures and sacrifices which vessels are often compelled to make by reason of threatening destruction or disaster on their voyages upon the seas. These rules were found to vary in different countries. In Great Britain, the first country to which we naturally look, a characteristic tenacity to existing customs had produced a strange anomaly. Arbitrary *practice* had assumed the place of *principle ;* and whilst text-writers repeatedly declared what *should be* the proper mode of adjustment, the adjusters had persisted in maintaining practices in direct opposition to such views. The same feelings had studiously withheld and prevented appeals to the legal tribunals on points not specifically ruled upon, and their entire code of practice was pronounced by their own elementary writers crude and inconsistent. In France and many other countries influenced by her great ruler, the Code Napoléon in its brief, terse terms swept away all previously existing laws, and arbitrarily established a new order of things ; but here, as with all new legislation, constant appeals to the courts had been necessary in order to define correctly the meaning and intention of the Code, and in adhering to the literal wording of the text many decisions had been given which in their application seemed to exceed the true principles sought to be established by the originators of that remarkable system of laws. In most of the other Continental Governments and in America, some, and in fact most, of the practice was found in accord. In distant and comparatively limited commercial countries there existed many obsolete, incongruous, and objectionable practices.

A separate branch of the Conferences was established on this subject, and delegates thereto were invited from the various commercial countries. Our Chamber of Commerce courteously responded to this invitation, and our first delegate to that first regularly organized body of this branch of international subjects was the Hon. Judge Wm. Marvin. At that Conference the result of their discussions was embodied in what was subsequently known as the "York" rules. So far was that learned gentleman from deeming the Chamber *committed* to the action of that body that he personally accounted to the writer for not taking a more energetic part in the discussions by the fact that the whole subject had to be referred back to each Government for authoritative action, where it would undergo scrutiny and discussion and a proper revision. Suffice it to say that these rules were found to be so inconsistent and impracticable that no one had the boldness to propose any action whatever looking to their adoption. Since that time there seems to have been little done in this branch—at least no new rules had been announced or proposed until the intended Conference at Antwerp to which our respected contemporary, Mr. F. R. Coudert, was appointed a delegate. At this meeting the York rules were first adopted as a basis for discussion, and it seems to have been decided that the discussion should be limited to amendments and alterations of those particular rules. However that may be, the product of this latter Conference is the York-Antwerp rules, but now accompanied by a new feature : reference to Governmental action is deemed too "old fogyish." Whether a fear of investigation or a contempt for constituted authorities was the motive, it is certain that, with an unheard-of and certainly unintended assumption, this body arrogates to itself the sole intelligence or capacity to review this subject, and couples with its decisions and results the resolve that at once, January, 1879, all ship-owners be urged to introduce into bills of lading a clause intended to bind all parties to the adoption of these rules, viz. : "General average, if any, to be payable according to the York-Antwerp rules."

Our own delegate reported fully the proceedings of the Conference to the Chamber, but simultaneously with his report a circular was promptly addressed by another person to ship-owners, merchants, and agents of steam lines, asking that they give their adherence to the rules by introducing the clause in question into all bills of lading to be used after January, 1879. Notice of this circular was brought before the Chamber, and that body referred the whole subject to a committee to report thereon to the Chamber. This committee carefully weighed every argument which could be adduced in favor of these rules, but failed to find them a fitting substitute for our existing law. They were compelled to declare them inconsistent in themselves, opposed to the true and only principles upon which uniformity is desirable, and, therefore, not willingly to be accepted. They further reprobated the very unusual and objectionable mode proposed to accomplish the result of a radical change in the law of the land, viz.: by special clauses in bills of lading. They were of opinion that the *only* body which the voice of the nation declared should have power over so important a subject was the Congress of the United States, where it would naturally receive full consideration and discussion, and where, if adopted, any legislation would necessarily ensure uniformity, which cannot possibly be claimed or anticipated for individual agreements.

To all and each of these propositions the committee invited attention and discussion, and they have yet to hear an argument which confutes their conclusion. The subject being purely professional, its elementary nature is not readily grasped by the ordinary mercantile mind. To a merchant it is simply an adjustment to which he is called to contribute for sacrifices or expenses incurred on the voyage, with which his only concern is usually to sign a bond and see that his insurer settles the bill. To the ship-owner or agent it is a means of getting back a portion of the account of disbursements and of stating his own claim against his insurers. To this latter class your correspondent belongs, and it is not to be expected that he should look upon it other than a question of barter—"give and take"; "What do we ship-owners gain or lose by the change? How much greater will be the allowance to us of ship's expenses during the delay?" etc. But to the legal mind the entire question is one of principles. The subject has its origin in the golden rule of equity. It seeks to restore the equality existing between all interests, which the act of man has set aside or suspended, for the general safety, and to compel participation in all expenses whereby any interest has been benefited. In such a view, every *deviation from principle* is unpardonable, for such deviation leads to endless difficulty and confusion. To distribute charges with accuracy and lay them upon their own proper beneficiary; to arbitrate and judge whether a sacrifice is entitled to contribution or not; to determine the exact time when the line of separation of expenses is to be drawn between general and special interests—these demand fixed and settled "principles" of equity. Everything less than these completely fails, for, being founded in injustice, true-minded men and nations will chafe under the restraint of such arbitrary and unjust rules, and will sooner or later set them aside. In such a view, any idea of giving up a practice strictly in accordance with true principles because some other nation, now for the first time alive to its own failings, offers to give adherence to some other practice which cannot be rejected without violation of those principles, is simply absurd. Consequently, the writer did earnestly oppose these rules of the York-Antwerp Conference, and did not discuss any points of the relative loss or gain in dollars to be thereby effected. I respectfully deny any attempt, directly or indirectly, to invoke national prejudice. I did state that Great Britain was the only country on the globe that had sought for the ruling that Rule 5 would establish, and that their own writers declared that their own courts would certainly conform to a different practice whenever the point came before them. And surely the admission by all the rest of the world that the ruling proposed is wrong should outweigh the wish of that one country on the opposite side, admitting that the wish exists, which may be doubted. If this be invoking national prejudice, then I am guilty of the accusation, and am wicked enough not to feel any regret for it. But I will not take up your valuable space with discussions on the merits of the Rules, nor go over the many other forcible objections to other inconsistent and improper changes proposed. The verdict of the committee was a deliberate one, and I stand by it.

If to endeavor conscientiously to preserve and maintain exact principles, instead of abandoning them for some unknown advantage to be derived from uniformity, is to be "one-sided," "erroneous," and "artful," and my arguments are to be stigmatized as "unduly magnified," "self-sufficient," and "discreditable," there would be little encouragement for that standard of uprightness to which I aspire; but I am somewhat consoled by the belief that your correspondent has not a large following, and that the main body of merchants are too intelligent to join him in so unjust and unwarranted premises. At the last meeting of the Chamber a reconsideration was asked for by a ship-owner, who pleaded lack of opportunity to inform himself, although avowing that he had voted with the majority. In this affirmative vote I joined, being willing to have the subject discussed from every aspect, and I am particularly pleased that it affords my esteemed opponent another chance to impress his views upon others; but I trust that he will then show by pertinent arguments that his opinions are based upon some true principles, and not on mere expediency, the doctrine of "give and take," or the reason that some pecuniary gain may be made.

Thanking you for the privilege of transgressing to such an extent on your valuable columns, I am,

Yours sincerely, A. F. Higgins,
Chairman of the Committee of the Chamber of Commerce.

New York, Jan. 7, 1879.

Notes.

G. P. PUTNAM'S SONS' new announcements include 'The Great Fur Land: Sketches of Life in the Hudson's Bay Territory,' by H. M. Robinson, illustrated; 'Soldier and Pioneer: Life and Family History of Richard Clough Anderson,' a Virginian of the last century; 'The Secret of Success,' by Wm. Davenport Adams; a volume on 'Ethics,' by President John Bascom, of the University of Wisconsin; 'The Art of Figure-Drawing,' by C. R. Weigall; a translation of Couture's 'Conversations on Art'; 'Emergencies, and How to Meet Them,' by Prof. Burt G. Wilder, of Cornell University; 'A Reading-Book of English Classics,' by the Rev. C. W. Leffingwell; 'Poesie für Haus und Schule,' by L. R. Klemm; 'The Currency Question,' by Robert W. Hughes, U. S. Judge of the Eastern District of Virginia: and additions to the "Hampton Tracts for the People" and the "Economic Monographs"—among the latter, 'The Currency of the Country,' by Secretary Schurz.——Roberts Bros. have in press Legouvé's 'Reading as a Fine Art,' translated by Miss Abby Alger; Mrs. Haweis's 'Chaucer's Tales Retold for Children'; 'The Dramatic List,' by Charles Eyre Pascoe; Mr. Kegan Paul's 'Mary Wollstonecraft's Letters to Gilbert Imlay'; Seeley's 'Life and Times of Stein'; and Hamerton's 'Life of Turner.'——Henry Holt & Co. will publish this month Mrs. Kemble's 'Records of a Girlhood,' with an early portrait of the author specially engraved for this American edition. They have nearly ready 'Demonology and Devil-Lore,' by Moncure D. Conway, a large work in two volumes, illustrated.——A. S. Barnes & Co. announce as in press the early numbers of the second volume of Mrs. Lamb's 'History of the City of New York.' The same house follow the lead of the *North American* in changing their *International Review* from a bi-monthly to a monthly, beginning with the January number. With the March number, they state, "the editorship will be assumed by Mr. John Torrey Morse, jr., author of the 'Life of Alexander Hamilton,' etc., and by Mr. Henry Cabot Lodge, formerly editor of the *North American Review*, and author of the 'Life of George Cabot.'" This will be welcome news to those who have not been reconciled to the transformation of the *North American*.——The Hebrew Book Union, 344 W. Thirty-first St., this city, solicit subscriptions to a 'Concise Lexicon to the Talmud, Targums, and Midrash Works,' by F. de Sola Mendes, Ph.D.——The *Jewish Messenger*, 92 Walker St., has begun issuing a monthly supplement called *Hebraica*, devoted to Hebrew literature and the science of the Bible. The editor is Dr. A. S. Isaacs.——The usual abstract of the proceedings of the American Philological Association for their Tenth Annual Session has just been published at Hartford. The eleventh session will be held at Newport, R. I., beginning Tuesday, July 15, 1879.——With the January number the *Bulletin* of the Nuttall Ornithological Club (Cambridge, Mass.) enters upon its fourth volume, with a very prosperous appearance. It is rare indeed that a technical magazine like this supports itself pecuniarily from the start, and is able to double the price of subscription while doubling its size. The publisher is Ruthven Deane.——We have before us the prospectus of the *Philosopher*, "a quarterly periodical, devoted to the advocacy and promulgation of Philosophy in its actual and ideal comprehension." The editor's address is 327 N. Third St., St. Louis.——We have received the first number of the *Canada Educational Monthly*, a magazine of good shape and promise (Toronto).——The *Tribune Almanac* for 1879 maintains its character for usefulness to journalists and politicians especially, but also to a larger public.——

Macmillan & Co. publish in a little pamphlet a course of addresses on Total Abstinence by Dr. B. W. Richardson, which deserve respectful attention on account of the author's standing in his profession. They have also issued Vol. II. of the second edition of Prof. J. E. B. Mayor's 'Thirteen Satires of Juvenal.' It contains the brief life of Juvenal, and the Notes to viii.-xvi.——B. Westermann & Co. send us Part I., Series 1., of Kampen's 'Descriptiones nobilissimorum apud classicos locorum,' to which we have before alluded. The contents are two pages of English letter-press on the insides of the cover, and three maps: the rout of the Helvetii, the fight on the Axona, and Alesia. This publication recommends itself strongly to classical instructors.——The honor of gratuitous imprint at the *Imprimerie nationale* has just been awarded to M. O. Douen's 'Clément Marot et le Psaultier Huguenot,' a work in two vols. 8vo, of great erudition, and curious for the specimens it gives of the primitive melodies of the psalms. The prospectus comes to us from the office of the *Société Biblique Protestante*, 5 rue des Beaux-Arts, Paris.—— Edmund Hoefer has published under the title 'Goethe und Charlotte von Stein' (Stuttgart, Krabbe) the papers which he has recently contributed to *Westermann's Monatshefte*. They have excited a lively interest in Germany from the singularly delicate and discriminating way in which he has treated the much-discussed relations of Goethe to Frau von Stein. He strongly opposes the commonly received theory of a platonic friendship, dwelling especially upon the marked change in Goethe's letters to her from March, 1781—a change which the late Mr. Lewes also referred to in his 'Life of Goethe.' His arguments, though strong and ably urged, are not convincing.——Under the title of 'Atlas de la Production de la Richesse,' Émile Justin has just published a series of twenty colored plates, in which he has ingeniously arranged the main classes of industry and wealth of each country, in order to exhibit their comparative standing, using the circular form of graphic representation invented by Mr. Wines and used in General Walker's 'Census Atlas.' It takes but a glance to comprehend that in a table of the comparative literacy of civilized nations the United States has the greatest number of those able to read and write, leading Germany slightly, while Portugal shows the largest segment of illiteracy, followed closely by Russia.

—The editor of the *United Service*, "a Quarterly Review of Military and Naval Affairs," of which the first number lies before us (Philadelphia: L. R. Hamersly & Co.), proposes that while this magazine shall, as its name indicates, be devoted specially to the interests of the Army and Navy, it shall present at the same time "such articles of general interest as to command the attention of all classes of readers." In fulfilment of this plan the first number contains the proposed variety of pieces, some good and some bad. "Polar Colonization and the Preliminary Arctic Expedition of 1877-78," by Capt. H. W. Howgate; "Conversion of Cannon," by Commodore E. Simpson; "Nicaragua and the Interoceanic Canal Problem," by Commander E. P. Lull; and other technical articles by officers of acknowledged authority on their respective subjects, are specially adapted to the military class of readers. "Four Naval Officers whom I knew," by H. Clay Trumbull; "A Spanish Fair," by Medical Director E. Shippen; and "The Wreck of the *Huron*," by Assistant-Engineer E. T. Warburton, one of the survivors of that disaster, are good average magazine articles. The number opens with an article entitled "Our Navy," by the Senior Flag Officer in the service, which is trivial in substance and undignified in style; and a quasi-scientific article, called "The Sun's Repulsive Force," by Lieut. R. M. G. Brown, is unqualifiedly bad. A good feature in the review is the publication in each number of one or more articles translated from foreign military journals. "Reminiscent of the *New Ironsides* off Charleston," by Capt. Geo. E. Belknap; "The Battle of Port Royal," a poem by Commodore T. H. Stevens; "The Grand Army of the Republic," by Robert B. Beath; and "The Indian Question," by James Joseph Talbot, make up the contents of the number. It is a question whether, in this country, a review devoted to military and naval affairs can command a sufficiently large circulation for success. The one way to secure such a circulation is the employment of good talent. Reminiscences of the late civil war are a trifle stale, even in the popular magazines, and the general reader would naturally expect from a review of this character some extended notice of foreign military affairs and of wars actually in progress. If the review is to be made a vehicle for the lucubrations of any Army or Navy man who wishes to see his name in print, it is easy to predict that a few numbers will finish its existence.

—We have been tardy in rendering an account of the third (Centennial) volume of the Memoirs of the Long Island Historical Society, published last fall. It is a remarkable proof of the Society's vigor that it should, in the space of ten years, publish two elaborate histories of the Battle of Long Island—the one, Thomas W. Field's, an octavo volume of 550 pages; the present, by Henry P. Johnston, of a little more than 500. It is safe to predict that a third will never be attempted, for as regards all the main features of this battle, and the fortifications and disposition of troops on the American side, Mr. Johnston's 'Campaign of 1776' has the stamp of a "last word." A clearer, more dispassionate military narrative, better supported by cited evidence, it has never been our good fortune to read; and the topographical details, so interesting to the inhabitants of the two cities separated by the East River, have been worked out so diligently and so admirably mapped that nothing is wanting for a complete understanding of the chain of disasters which began with the surprise of the American patrol at the Jamaica Pass in the early morning of August 27, 1776, and ended with the surrender of Fort Washington on the 16th of November following. Some of the moot points discussed in the text or in the longer notes may be briefly enumerated. General Putnam is vindicated against Bancroft, Field, and others, who have charged him with being responsible for the loss of the battle of Long Island. The British and Hessians are acquitted of excessive cruelty: "that word 'massacre' should have no place in any accurate description of the battle." The American losses are set down at 1,000 in round numbers, confirming Washington's original estimate to Congress. Washington's sudden determination to retreat Mr. Johnston prefers to ascribe, with Gordon, to the development of Howe's intentions of advancing by trenches upon the Brooklyn works. The responsibility for the loss of Fort Washington is fairly divided between the Commander-in-Chief and General Greene—that is, the latter is held accountable for having given bad military advice; the former for having refrained from ordering the evacuation while there was yet time, and when, by his presence at Fort Lee, the acts of his subordinate became his own if not peremptorily countermanded. This disaster by far exceeded all the losses on Long Island, at Kip's Bay, Harlem Heights, and White Plains. In describing the Kip's Bay affair, by the way, Mr. Johnston makes the only slip in a uniformly excellent style when he speaks of Colonel William Douglas having "all but escaped capture"—meaning "was all but captured." The second half of this volume is filled with valuable documents, mostly inedited, of which the most important is General Greene's order-book while in command on Long Island. Corresponding to the scheme of the American army, in chap. iii., is the list in the appendix of officers and men taken prisoners on Long Island. The portraits of four colonels—Lasher, Hand, Glover, and Huntington—are representative of New York, Pennsylvania, Massachusetts, and Connecticut—four of the nine States whose troops composed Washington's army. Finally, the maps are worthy of the highest praise; that representing Manhattan Island in 1776 will be particularly acceptable to New-Yorkers.

—We have received the 'Catalogue of the Loan Exhibit in aid of the Society of Decorative Art' of Chicago. This exhibition, as we in New York, in our old-fashioned way, would call it, was held during the past autumn. A brief prefatory notice, signed by Mr. Stanley Waters, states that the society entrusted to him the collection, arrangement, and cataloguing of the whole. Our New York exhibitions of last year and the year before had not the benefit of a general director. They did very well in spite of that want, especially the latest one, which was really a wonder of clever arrangement and classification, considering the manner of its inception and carrying out. Still, much better things are possible with a competent person at the head, giving time enough to go more or less into detail. And the catalogue especially needs an editor or compiler, if it is to be a "catalogue" at all, in the strict or technical sense. To be a catalogue, and not a mere list, some system of classification must be followed in the work. But in this respect Mr. Waters's work is not carried so far even as the more recent New York Loan-Exhibition catalogue; that at least followed the classification by rooms, and the Oriental wares were carefully separated from European, European pottery from other works of ornamental art, and all from the paintings. But even this primitive division, according to origin and material, has not been followed in the Chicago example. At first it seems that Greek pottery is to be kept by itself, and Majolica, etc., to follow in their order, but at No. 137 this order disappears. The requirements of ownership take precedence; a Minton cup and saucer and a Lowestoft cup are followed by "Towel, old Turkish embroidery, of a stitch not now used," five numbers farther on by a "Collection of Turkish Rag-Babies from Mosul," this by a Japanese crackle vase, and that by an engraving by Raphael Morghen. In one respect, however, this pamphlet goes further than its New York

equivalent: the accounts given of the objects exhibited are fuller and more explanatory, at least in many cases. *Scribner's Monthly* for January, in its editorial pages, has pointed out that it is in this direction chiefly that it will be found practicable to improve these catalogues. Elaborate classification will be found too slow a process, time will be consumed, and the pamphlet will not be ready until long after the opening of the exhibition, but nothing prevents the describing with greater fulness and accuracy each article under its number. All that is needed for that great improvement is to obtain the services of a competent person; but that, as *Scribner* hints, is the difficulty, inasmuch as "the few competent persons are unable to give away their time and knowledge to such an extent, and it is not the fashion with us, as yet, to pay for professional or skilled services where it can possibly be avoided." However little has been done hitherto in this direction, it becomes easier each year to be more full and thorough, and harder each year to remain brief and careless. The step Mr. Waters has taken in the work under consideration will be followed by a longer stride in the same direction without doubt, and whenever loan exhibitions begin to be held by artistic societies for the sake of the exhibition, and not of what it earns, it will be found absolutely necessary to give information with regard to the works of art exhibited at once more full and more carefully arranged than we have allowed ourselves to dream of as yet.

—A recent number of *L'Art* contains, among other engravings from American pictures at the Exhibition, two woodcuts from Mr. Vedder's "The Young Marsyas" and "The Sybil." They are engraved on a large scale, and the woodcuts preserve much of the character of the painting, as well as can be judged by a comparison with three months' intervening. The engraving is not of the last refinement, certainly, but suits the style of the pictures better, perhaps, than if more minute and delicate. The text contains a very severe criticism indeed of these pictures. Oddly enough, it is the use and alleged misuse of classical themes that enrages the writer; he has little to say about the purely artistic qualities of the pictures, but assails them in the same terms that he might use in speaking of a poem of classical subject—Morris's "Bellerophon" or Swinburne's "Atalanta." It certainly seems strange, too, that the magazine should give up so much space to careful engravings of these two works if they were so badly thought of in the editorial office. Mr. Vedder sends, from his studio in Rome, a vigorous protest against the treatment he has received. He alleges that he never means to object to criticism, but that in this case he thinks he was "caught in a trap" and betrayed. His reasoning seems to be: "Certainly I had a right to assume, when I was formally asked leave to engrave a picture, that the said picture was admired; certainly, if I had known that it was despised, and that its appearance in *L'Art* would serve only as a chance for unmeasured abuse of it and of my way of work, I should never have granted the permission asked for." And in this Mr. Vedder is clearly right. As to the merit of the pictures we have now nothing to say; but imagine the position of a writer for an American magazine who should write Mr. Vedder at Rome, to ask for a photograph or drawing that it might be engraved, and then use it in his article only to "pitch into" it and him. Besides the lithographed circular of which we have spoken, there are in town copies of the letter from *L'Art* to Mr. Vedder asking for a drawing of the picture, or, failing that, permission to photograph it, and of his letter to *L'Art* after the appearance of the engravings and the criticism. With a proper feeling Mr. Vedder has made his circular less sharp in language than his letter to the journal.

—In response to numerous memorials from Western agricultural and horticultural bodies, and the petition of a special congress of the executives of the various States and Territories more particularly interested, Congress, in the spring of 1877, created a special commission to report upon the Rocky Mountain locust or Western grasshopper. The commission was charged to make such investigations as would avert, wholly or in part, the fearful destruction to the agriculture of the trans-Mississippi country that had so often followed the undue increase of this pest. The Secretary of the Interior displayed unusual judgment in the appointment on this commission of Prof. C. V. Riley, Dr. A. S. Packard, Jr., and Prof. Cyrus Thomas; and their first annual report, made within the year of appointment, is a monument to the industry, energy, and method with which their enquiries were pursued. Its 700 odd pages are replete with original facts and conclusions in a field that had scarcely been trodden before, and it is one of the few Government documents which will bear republishing in future years, being not only a contribution to science, but a repertory of important practical information. The first edition has already been found quite inadequate, and the Interior Department has had a small special edition published, while Senator Paddock, of Nebraska, a Chairman of the Senate Committee on Agriculture, has introduced a resolution calling for the printing of 30,000 additional copies. In his annual report Secretary Schurz points to the fact that the problem of destroying the young insects as they hatch in the more fertile country to the southeast is virtually solved by the commission, but that there is an important task yet to be performed in learning how best to prevent the excessive multiplication of the insects in their native northwest breeding-grounds, and their consequent migration therefrom. The small appropriation of $15,000 is asked for this purpose and to enable the commission to complete the work assigned to it. We give prominence to these facts because the fear is being expressed in some leading agricultural journals that the reorganization of the public surveys, as explained in our last week's issue, will virtually do away with this commission and prevent the completion of its work. This fear is based on the fact that the commission is nominally attached to Hayden's Survey; but whatever action be taken on the recommendation of the National Academy regarding the different surveys, the completion of the work of the Entomological Commission is easily ensured by substituting "under the Interior Department" for "attached to the United States Geological and Geographical Survey of the Territories," as the appropriating clause now reads in the bill of estimates. The important work yet to be done in this locust enquiry ought not to be hindered when the obstacle to its accomplishment is so easily removed.

—There seems to be no small danger that the present Congress may show more energy and zeal than wisdom in legislating with regard to the public health and for the prevention of epidemics. Certainly there is great distrust among leading physicians and sanitarians as to the results of the labors of the present Congressional Commission on Epidemics with its so-called experts. Although seven medical men are members of the House and two of the Senate, no one of these was placed on the Committee, and of the experts not more than two have any reputation as sanitarians among those qualified to judge. To this select committee has been referred Senate Bill 1462, introduced by Mr. Lamar, a copy of which we have before us. This bill converts the Marine Hospital Service of the Treasury Department into a Department of Health, with despotic powers in the hands of the Chief of the Department, who can only be removed from office by trial before the Chief-Justice of the United States, and whose salary is to be $7,500 per annum. He is to make and enforce all quarantine and other regulations for the prevention of cholera, yellow fever, and other epidemic diseases in the United States, can override State and local Boards of Health, close any port, or stop any railroad that he pleases, and is responsible to no one. When it is remembered that the person who is to have these powers and privileges, and for whose exclusive benefit the bill seems to be drawn, is now the chief of the experts who are counselling the select Congressional Committee just referred to, and that he was the sole professional adviser of the Committee in the selection of its experts, there certainly seems good reason for the declaration of the American Public Health Association, through its officers, that "the true interests of public health and sanitary science in the United States are in grave danger at the present time."

—This declaration we find in a memorial signed by the officers and Executive Committee and members of the Advisory Committee of the Association, as the result of their deliberations at a special meeting in Washington January 2 and 3, 1879, and as the names appended to it are those of the best known sanitarians in this country their advice certainly demands respectful consideration. They urgently recommend that no legislation be undertaken by the present Congress with regard to a National Quarantine, but that a Provisional National Health Commission be authorized to elaborate and report to the next Congress a plan for a permanent organization bearing a similar title. This plan, they continue, should include one for a national system of quarantine, and should be prepared after consultation with the State Boards of Health and experts. The Commission should also "take charge of any investigations into the causes and means of prevention of yellow fever," or any other epidemic diseases referred to it by Congress. To free it from all suspicion of incompetence or political intrigue, its members should be selected by the National Academy of Sciences. The Association further think it "highly desirable that there should be added to the Standing Committees of the Senate and House of Representatives a Committee on Public Health."

—The rage for burlesque seems to continue with unabated force wher-

ever the English language is spoken, and it continues to improve in musical as well as in dramatic qualities. With "Evangeline" at Booth's, the "Babes in the Wood" at the Park, and even a private production of "Fair Rosamond" at the Union League Theatre, for the benefit of the Harvard Crew (all very successful), there can be no doubt as to the popular liking for this sort of extravaganza, though its popularity is also well calculated to make the judicious theatre-goer occasionally grieve over the decadence of the drama, or of popular taste, or both. With the exception of one or two plays ("Trial by Jury" and "H. M. S. Pinafore" are the only productions of the kind that we now recall) there is a total want in the English burlesque school of any regard for, or even recognition of, the laws which regulate this branch of the drama. Burlesque on the stage is no new thing: to take a single example, almost the whole of Sheridan's "Critic" is burlesque of the wildest description; but it is burlesque which makes fun of the subjects selected intelligently. There is burlesque statesmanship, and burlesque love, and burlesque war, but they are all recognized at once as based on a perfectly just appreciation of what the real thing is, and the difference between it and the sham. In the French *opéra bouffe*, too, in its wildest moments, there is always a coherent and intelligent idea behind the absurdity; and though professors of wit and humor might not in all cases agree as to what particular intention underlay a particular piece of *bouffe*, there is never a feeling of that emptiness and weariness produced by efforts to be amusing, which fail because there is nothing to be amused at. Modern English burlesque, however, knows no law of any kind. Generally some familiar fairy story is taken and dramatized with changes which relieve it of all its prettiness, and incorporate into it much vulgarity. Sometimes, instead of a fairy story, it is a myth or historical story; and always the aim of the author is to make his dialogue full of puns and meaningless play upon words, and airs and choruses more or less pretty. Although an enormous amount of labor is misspent on the dialogue, the music is really what makes the whole endurable; for it is impossible to imagine any one listening to an English burlesque as a play for half an hour. In the music there is steady improvement, as any one will admit who will compare such singing as that of the Park company in the "Babes in the Wood" with that which Miss Lydia Thompson used to provide for the public a few years since.

—It has been a matter of wonder and regret that to this day the land of Goethe, the book-making country *par excellence*, has not produced any edition of the works of its greatest literary genius worthy of the man and the land. Up to 1867 the copyright of Goethe's works was owned by the Cottas of Stuttgart, who published many different editions on good and bad paper, but all equally poor with regard to the text, which was corrupted to unintelligibleness and full of misprints copied from one edition into the next, and often improved on after the fashion of Mr. Ballhorn (as the German saying goes), but never benefited by any critical revision or an attempt at such. When at last the copyright ceased and everybody could print Goethe the market was flooded with 8vo, 12mo, 16mo, and other editions in German and Roman type, with and without illustrations. None of them, however, with the exception, perhaps, of the illustrated edition of Grote, in Berlin, were any improvement, with regard either to external appearance or textual revision, on the old Cotta editions. To the late Gustav Hempel, of Berlin, one of Germany's most enterprising publishers, the Fatherland is indebted for the first "nach den vorzüglichsten Quellen revidirte Ausgabe" of the works of Goethe (and many other classic writers), published in "Hempel's National-bibliothek der deutschen Classiker." Since 1868, G. von Loeper, Strehlke, Biedermann, Düntzer, and the publisher himself, although his name does not appear on the title-page except as publisher, have edited that truly excellent edition which has already become the standard one quoted by all scholars. It size and print, however, are inadequate to the greatness of Goethe's fame and the place he takes among the writers of all ages, not to speak of the wishes of book-lovers and bibliomaniacs. If a French publisher could bring forth a monumental, almost folio, edition of Alfred de Musset, with fine engravings, which his countrymen absorbed to the last copy, though the heavy volumes almost weighed down the graceful but by no means grand poet, the German bookseller had to blush when he could offer none but this pocket edition of the giant among modern writers as the only textually recommendable one. It is with a genuine feeling of great satisfaction, therefore, that at last, forty and odd years after his death, we can announce that a second "Bearbeitung" of Hempel's Goethe is spoken of as in preparation, which is meant in its outward dress too to take the measure from the man. As a precursor, "Faust," with introduction and annotations by G. von Loeper, is announced by Hempel's publishing house, in 8vo, well printed on good paper, as appears from a prospectus just issued. Although even this new effort might have aimed a good deal higher, yet, if one thinks of the various library editions of Shakspere, Milton, Molière, Dante, and *dii minorum gentium*, the text and notes will certainly be all that can be desired; for Loeper nowadays holds without doubt the first rank among Goethe scholars—an opinion academically endorsed last year by the Berlin University, which conferred on him the degree of "Doctor phil. honoris causa" for his eminent services as editor of Hempel's Goethe; and it is to be borne in mind that the Berlin University, if anything, is quite the contrary of lavish in thus honoring even those to whom honor is due. There is no doubt that this second edition will be benefited by the vast material brought to light since the first was started, and by the many fresh contributions to the study of Goethe, in a great measure brought out by the Hempel edition. Germany, and the adherents of the Goethe Cultus at large, may well be congratulated on this prospect, if there is reason to congratulate Goethe's country for performing a sacred duty at so very late a date.

—The German periodicals are just at present filled with discussions as to the relations between Darwinism and Socialism. Those who have clear and definite ideas regarding these two "isms" must be at first inclined to regard the matter in the light of a broad joke. Certainly nothing could be more comic or even grotesque than the accusation that evolution or Darwinism has furnished the Social-Democrats with weapons of defence or justification. One is tempted, therefore, to attribute the whole discussion to the proverbially defective sense of humor which characterizes the Germans as a people. But when one finds no less an authority than Professor Virchow hinting at a connection between the two pernicious doctrines, and Professors Haeckel, Oscar Schmidt, and Carl Vogt protesting against the accusation of such an alliance, one feels bound to pause for a moment and see what this new paper-war is really about. At the fifty-first assembly of German naturalists, at Cassel, Prof. Oscar Schmidt delivered a lecture on this topic, which subsequently appeared in the *Rundschau*, and may now be obtained in pamphlet form. Haeckel's remarks on the subject will be found in the preface to his reply to Virchow; while Vogt's letters have appeared in the *feuilleton* of recent numbers of the *Neue Freie Presse*. One ingenious Socialist, it appears, has made the remarkable discovery that the fundamental maxim of Darwinism teaches the perfect equality of all men; while another kindly informs us that Marx's book on Capital, the Socialist's bible, is the continuation and completion of Darwin's 'Origin of Species' and 'Descent of Man.' On the other side, an Ultramontane newspaper published at Berlin did not hesitate to make the theory of descent responsible for the murderous assaults of the Socialists Hödel and Nobiling. Such statements, of course, do not come within the sphere of serious criticism. Considering that no theory was ever announced in more precise and definite language than that of Darwin, it seems to take an abnormal amount of time to beat into most people's heads correct ideas in regard to it. The only point in which a Darwinist may condescend to shake hands with a Social-Democrat is that both reject certain religious dogmas relating to the special creation of man. In all other respects, however, the two parties in question are directly at cross-purposes with each other. While the Socialist clamors for an equal distribution of property and privileges, the banner of Darwinism bears the motto, Selection—the survival and preference of the fittest in the struggle for life. This is essentially an aristocratic principle. If by some decree of Providence the Socialist ideal should be suddenly realized, and all wealth and rank equally divided, a few years would suffice, through the operation of natural selection, to restore the old order of things. That the word *fitness* is not synonymous with moral worth but with power is not Darwin's fault. He did not make the world. All he did was to point out that the struggle for life, with its consequences, is found everywhere in nature, in human society as well as among the lower animals and plants. Civilization has, however, done something to counteract the harshest results of the law of selection. We have hospitals and charitable institutions for the deaf and dumb, the cripples, the insane, and for those even who are afflicted with incurable diseases—all of whom in a state of nature would be eliminated. Now, if some bold moralist should step forward and argue that the law of selection should be restored in all its vigor and these individuals allowed to perish, he would be a proper subject of attack for all those who believe in the principles of Christian ethics. But to make Darwin and his followers responsible for Socialist disorders because they have pointed out that to some extent the law of selection operates in human society, is not a bit less ridiculous than it would be in case a falling meteor should kill

a peasant in the field to accuse Newton of murder because he pointed out the law of universal gravitation.

—Don Baldomero Espartero died last week, at the age of eighty-six years and ten months. Though he outlived his time of public activity by nearly a quarter of a century, his record, either as a general or a statesman, has not been eclipsed by a single name in the Spanish history of his time. The achievements of the most renowned Spaniards who figured during his long life—though the list includes Palafox, Riego, Toreno, Mina, Cabrera, Martinez de la Rosa, Olózaga, Narvaez, O'Donnel, Prim, Serrano, and Castelar—are insignificant in comparison with his. The best of his competitors in the field of ambition failed to achieve lasting success, from lack of ability or from excess of enthusiasm; the most successful stained their record by self-degradation at the court of Maria Christina or of Isabella, by political desertion, and by shedding blood profusely in the cause of despotic repression or in reckless insurrections. Espartero's public career—whatever the inner traits of his character and the real springs of his actions may have been—was free throughout from blots of this kind. He fought for the independence of Spain against the French (enlisting in 1808), for her power against the South-American insurgents (1815–24), and for her freedom against the Carlists (1833–40); and when constant victory in the struggle with the latter successively raised him to the dignity of commander-in-chief (1836), of duke (1839), and of regent for Queen Isabella (1841), he clung to his Progressist banner, maintained his dignity against the abettors of Maria Christina, and succumbed (1843) only to a combination of rivalries, intrigues, and anarchical opposition such as a bloody terrorism alone could have disarmed. In exile (1843–7) and in voluntary retirement (1848–54) he abstained from conspiring, and when sharing power with O'Donnel (1854–6) he represented the Progressist side of the coalition. In his last retirement he declared his adhesion to the cause of the people on the fall of Isabella (1868), and declined to be a candidate for the vacant throne, when his name was brought forward in the Cortes (1870). He was the son of a wheelwright.

—Poggio Bracciolini, the famous scholar of the Renaissance, to whom we owe the discovery and preservation of so many classic works, is now chiefly remembered for the collection of questionable anecdotes which he published in the last years of his life under the title 'Liber Facetiarum.' The officers of the Roman chancery were accustomed during the pontificate of Martin V. to assemble in an apartment called the *Bugiale* (which Poggio explains by *mendaciorum officina*) and tell stories. "No one was spared there," says Poggio; "we spoke ill of all that displeased us. Often the Holy Father furnished the starting-point for our criticisms, and many persons came to our meetings for fear that we would begin with them." These stories Poggio turned into Latin, to see, as he says, whether it was possible to render into Latin many ideas which are considered difficult to express in that tongue. They proved very popular, some thirteen editions, including translations, having been published since 1470. Many of these editions have become scarce, while the text of the majority is incomplete and bad. The want of a complete edition led to the recent publication at Paris of the Latin text with a French translation. A small number of copies were printed and sold at once. A second edition has since appeared under the title 'Les Facéties de Pogge' (Paris: Liseux. 1878). The text is preceded by a bibliographical notice, a life of Poggio, and an examination of his various writings. The stories are unaccompanied by notes, which lessens the value of the edition for scholars, who will still be obliged to refer to the edition of Noel (London: 1798). There is, however, an index of proper names containing some historical information. The collection is chiefly valuable for the history of the culture of the Renaissance, and also for comparative storiology, as some one has named the genealogy and comparison of popular tales. It was also the first of the long series of *Facetiæ* which make such a show in the literature of the fifteenth and seventeenth centuries. The last edition forms part of the *Petite Collection Elzévirienne*, and is most daintily printed.

ROSCHER'S POLITICAL ECONOMY.*

THE present status of the science of political economy is most unsatisfactory. While the chief scholars in the science are not agreed as to its methods, axioms, or objects, it can hardly be expected to advance steadily or rapidly, and it will be exposed to the easy contempt of charlatans and "practical men" on the one side, and to the confusion produced by clever but ill-trained adherents on the other. It has been known that the Germans, having only latterly taken up the study of political economy, professed to have reconstructed the science which their predecessors in England and France had only entangled, and to have given it form, method, limits, and purpose. We have now before us the first English translation of an important work in this school. No doubt this task has been so long neglected because it was not believed that the German systematic works contributed anything at all proportioned to their bulk to the science as already presented in English text-books, but the appearance, in an English dress, of a work which has long enjoyed high reputation on the Continent is nevertheless an important incident in the history of political economy amongst us. It is likely to produce a controversy similar to that which has been for a good while carried on between the French and German economists as to the merits of the "historical method." It is very possible, also, that it may for a time only increase the confusion now reigning in the science, because the views of the historical school are well adapted to captivate just that group of professed economists who, as an English critic expressed it, "only muddle things." We believe, therefore, that it is especially necessary to point out, upon the introduction of this work, (1) that economists cannot be divided into schools which are distinguished by the fact that some study history and others do not, so that the issue raised by the designation "historical" is not correctly joined; and (2) that Roscher is by no means a fair representative of the new German or historical school.

Roscher mentions but one other school to be distinguished from his own. This he calls the "idealistic." He does not define it very clearly, and does not mention the writers who compose it; but he seems to refer to the utopia-makers, or to the *à priori* world-reformers. It is a perfectly legitimate usage, however, to exclude all such writers from the group of "economists" altogether. If they were to be included, and then distinguished as non-historical, the distinction would be just; but it would contribute nothing to the classification of the economists properly so called, while there are distinctions among the latter which require classification. Roscher has behind him a whole school of writers who have seized upon certain notions and tendencies of his and pushed them to exaggerations in every direction. In his doctrines he agrees with the great English and French economists of the century which has just closed; but his followers (as they call themselves) have run off into every divergent doctrine as to wages, rent, population, and international trade. Roscher does not limit political economy to the bounds observed by English and French economists. He makes it a point to go over the bounds of the science and to trench upon those of the art of economy, especially when in taking the latter step he is led into statecraft, or the art of the statesman. He believes that this is proper for the economist. Hence these two volumes only reproduce the first of four which his plan comprises. His followers of the school embrace in their works discussions of moral, social, æsthetic, and philanthropic projects. Instead of striving, as the English and French economists have done, to give precision to the science, they overload and dissipate it by introducing all sorts of matter into it, and by taking away its boundaries. Instead of favoring a division of labor between History, Statecraft, Law, Police, and Political Economy, and seeking to advance by the more complete and independent development of each of these subjects by itself, they obscure all the distinctions between them. They yield themselves, also, in pursuing the course described, to the motives of sympathy, sentiment, benevolent preference, and philanthropic hope. They therefore present too often the spectacle of men with whims or hobbies. One has a "fad" for trades-unions, another for co-operation, another for forest-culture, another for preventing a scarcity of houses, another for putting a stop to stockjobbing.

Roscher allows to the state a degree of initiative and regulation which may seem practicable and advisable to a German, but which few Englishmen or Americans would approve. To take an instance which Americans are in a good situation to criticise, it is only necessary to refer to what he says about emigration and colonies—things which certainly involve some measure of statesmanship. This economist undertakes to discuss the advantages to a country of getting colonies by state initiative when it has none; where they should be, how they should be organized, etc. He appears to assume that they would certainly trade with the mother country, and even hints at a "colonial policy" of taxation. He also follows emigrants to their new home in an independent state, and discusses their subsequent relations to their old home, or to their new neighbors on account of their old home. The impropriety, from a scientific point of view, of such speculations could not be more clearly demon-

* 'Principles of Political Economy. By William Roscher. With Chapters on Paper Money, International Trade, and the Protective System; and an Essay on the Historical Method in Political Economy, by L. Wolowski. The whole translated by John J. Lalor, A.M.' 2 vols. Chicago: Callaghan & Co.; New York: Henry Holt & Co. 1878.

strated. They are necessarily *à priori* speculations; they do not deal with scientific theorems but with practical exigencies; they belong to a domain foreign to the writer, viz., that of the statesman. Another example is furnished by the Appendix on the protective policy. After stating with great clearness the grounds for free-trade, the author declares that infant industries may properly be nursed by protective taxes. This is a most plausible notion when regarded *à priori*, but there is no notion which "history" has more distinctly proved to be fallacious.

Roscher's followers have here again exaggerated his tendency. They invariably look to the state for the force to execute the projects to which they take a fancy. They exaggerate his almost comical horror of "atomism." They distrust the individual and regard his initiative as always selfish and anti-social. They trust the state without reserve; they believe in its power and wisdom, and seem to think selfishness has no possible place in its activity. But it is to be observed that the economist who recommends to the statesman to take certain measures so as to realize certain social improvements, must have before his mind an "ideal" of what he wants to see accomplished. It may not be a Utopia, but it is the present society modified as to one or more of its elements. He may have borrowed his ideal from an obsolete state of society instead of creating it in his fancy, but it is just as impossible to wake the dead as to create a new order of men, and just as impossible to revive a dead institution as to create one *à priori*. The economist may bring forward any amount of historical lore; he is none the less an idealist, and with his state control set at work to "elevate" society or classes, he is a socialist.

The men of this school in Germany have assumed the name of the "historical school." In their books is to be found a great mass of material in reference to the history of economic doctrines and literature, and in regard to the history of institutions. The zeal and industry with which this material has been collected are recognized by everybody. Its value is unquestionable and unquestioned. No economist nowadays can afford to neglect this material. Roscher's book comprises, for perhaps nine-tenths of its substance, historical and statistical notes of great interest and value. They embrace the history of the doctrines presented, the literature of the subject, illustrations of the text, and statistical proofs. In general, it may be said of these notes that they are judiciously selected and limited. They unquestionably add much to the interest and satisfaction with which the reader peruses the text. But it cannot be said that there is here any novelty of method. It is at most a matter of degree. The text proceeds by the deductive method common to all the economists. The opening sentence of the book is, "The starting point as well as the object point of our science is Man," a proposition which is entirely idle and superfluous, because it is true of political economy only as it is true of any other science. It is, however, one of the points on which the "school" prides itself, that it keeps this proposition in mind, and it is the proposition by means of which it breaks down the proper limits of the science, and sallies forth as has been already described. This stumbling block being passed, the next sentence is, "Every man has numberless wants," and from this axiom the whole system is deductively constructed in the usual manner.

Here again the disciples have left far behind the reserve and moderation of the master. It is easy to see how this method of constructing books (for this is what it is, and not a method of treating the science) may be abused. The notes may run into pedantry or display of erudition, or they may include mere antiquarian curiosities. Such notes are, in fact, dangerous, for they can only be fragmentary and one-sided, and nothing is more mischievous to the science than generalizations from fragments of history and shreds of statistics. These errors are abundantly illustrated in the literature of the "historical school." There are treatises which pretend to discuss doctrines, but stop short with a history of doctrine. There are others which give a history and then take flight into the realms of speculation. To the careless reader the former part may seem to give some authority to the latter when there is really no nexus at all. The best-informed scholar is the one who knows best how very difficult it is to obtain from books a deep and thorough comprehension of social conditions which are past or remote, and how careful it is necessary to be in drawing inferences. In proof of this we have only to refer to the statements about the United States in the book before us. They are rarely accurate, and never sufficiently comprehensive. It is to be observed, further, that these historical and statistical notes lose value as time goes on, unless they are brought down to date with every new edition of the dogmatic treatise of which they form a part. This is done to some extent in Roscher's book, but the standpoint is still that of the first edition, twenty-five years ago. The method of the historical school, therefore, even as a method of book-making, is only an extension of that with which we are all familiar, and it is open to question how far that extension is wise.

It appears, then, that the "historical school" has no monopoly of respect for history, that it embraces men of extremely different opinions, of whom Roscher is perhaps the most conservative who could be mentioned, that it has no "method" which can be distinguished from other methods, or which is an independent method of treating a science, and that the men who are grouped in it have in common a set of views as to the limits of political economy and its relations to other sciences, a set of motives in sentiment, sympathy, and hope, and a peculiar faith in "the state." These latter peculiarities, however, are what constitute a "school." The opponents of the "historical school" have, therefore, never disparaged the historical method, and have never admitted the justice of the designation assumed, and they have given to the school in question the name of the "professorial socialists." The opponents study history in its breadth and sweep, believing that it is only when thus studied that its true lessons can be learned, or, especially, that the social forces at work in it can be discerned and their laws discovered. History, therefore, cannot be written together with dogmatic science, but is a separate discipline which must be cultivated by itself. The same may be said of statistics. The scientific economists (if we may so call them for distinction) aim to restrict political economy within the limits of a definite group of phenomena, and to work out the laws controlling those phenomena with the greatest possible precision. They therefore draw the line between the science and the art as sharply as possible. They regard the state, for all purposes which here come into account, as simply a group of men, who will be found no different from other men, and against whom the individual must be guaranteed his liberty just as much as against his neighbors. They perceive that the social order is controlled by laws in regard to which man has nothing to do but to learn and obey them. The existing social state presents those laws under complex phenomena, which cannot be separated by experiment. The object of study, therefore, is: What is; and the value of history is that it shows in operation the forces of which the existing status is the resultant, and thus helps to explain it. As for what ought to be, or what will be, with that science has nothing to do, but economic science teaches just what other sciences do—namely, that man will be better off in this world just in proportion as individuals apprehend correctly the laws of life which this science teaches within its domain, and regulate themselves accordingly. The "historical school" bears witness in its polemics to the fact that the scientific economists are its true adversaries.

We have several times remarked that Roscher presents the errors of the school in their mildest form, and that the doctrines which he teaches are those of the "orthodox" economists. The chapter on Population is the best in the book, and it contains the best exposition of that subject before the public—stated, too, within very moderate limits. This chapter and the one on Rent present those subjects in a manner especially adapted to meet the empty objections which are most current on this side of the water. The chapter on Wages is not so strong. Although in the main correct, it stumbles over the doctrine that a demand for commodities is not a demand for labor.

The translation is very conscientious and correct. German, with its numerous abstract terms, lends itself with facility to a writer who is willing to yield occasionally to kindly feeling. When such a sentence is translated into English, there is likely to be little clear sense in it; but it is not the translator's fault. However, on page 12 of vol. ii., the author is made to say: "If justice pure and simple were meted [out in the distribution of products] no man could *subsist*." What he says is: "No man could stand the test" (*bestehen*). This assertion is out of place, for it alludes to other considerations than those in the context, but it is very different from the former assertion.

Thirty Years at Sea. By E. Shippen, U.S.N. (Philadelphia: J. B. Lippincott & Co. 1878.)—The argument of this book is the adventures of a boy born at sea, working his way up from before the mast to being captain of a brig and acting-master in our Navy. In his career he is concerned in every form of adventure known to the annals of the sea. The scenes and events are described with much minuteness, but some of the observations are trivial and some out of character. As a whole the descriptions lack color. Some most tragic events are treated with the brevity and baldness of a school geography; others, which evidently are part of the writer's own experience, are much more stirring in the reading, and among these are the loss of the *Congress* and the actions of Fort

Fisher. Both the last are familiar passages of history, and need not be repeated. But the scenes on board the fleet described by an eye-witness are full of interest. The captain of the *Congress* had been detached and was waiting on board for a transport to take him South to his new command. The ship was temporarily in charge of the first-lieutenant, who had orders to take her to Philadelphia, and lay her up as soon as she was relieved by her successor. She expected to sail about the 10th of March. The existence of the *Merrimack* was well known, but the endurance of ironclads had never been tested. It was believed on board the *Congress* that if she could get the *Merrimack* under her guns she could send her to the bottom. The frigate *Congress* and the sloop *Cumberland* were off Newport News, at the mouth of James River. The frigates *Roanoke*, *Minnesota*, and *St. Lawrence* were off Fort Monroe in Hampton Roads, which was full of army and navy supply-boats. The 8th of March was a fine, soft day, such as at the South often gives early promise of summer. The men were engaged in their regular dull routine at anchor, and the officers on deck were lazily moving about and watching the gulls. Between twelve and one P.M. the lookout on the *Congress* reported three steamers coming out of Norfolk. Two of them were the *Jamestown* and *Yorktown*, and the third, which looked more like a child's Noah's ark, was soon recognized as the *Merrimack*.

As they kept on slowly clear of Sewell's Point they were seen from Hampton Roads and created no small stir there. They soon turned into the James River channel, which disclosed their purpose. The two great steam frigates in the Roads, assisted by tugs, and the *St. Lawrence*, depending on tugs alone, directly got under way and hurried up to meet the *Merrimack*. In their eagerness they pushed into shallow water and ran aground, one after the other, a mile or two from Newport News. There they lay helpless and anxious, excited spectators of the fate of their consorts, which seemed impending over themselves. In the meantime, as soon as the object of the attack was evident, the *Congress* beat to quarters, and her drum was instantly answered by that of the *Cumberland*. Springs had been put on the cables for just this emergency, and the men had been drilled at springing the broadside in different directions. Now the tide was too strong. The ship would not move, and her broadside could not be brought to bear. As it turned out this made no difference in the result. The *Merrimack* came on silently and doggedly. When near enough to make out her plating the *Congress* fired a solid shot from a stern gun. It struck full on the forward casemate of the *Merrimack* and bounded off like an india-rubber ball. At this the hearts of our men sank within them. They had known they were weaker for defence, and now they saw they were powerless for offence. The *Merrimack* answered with grape from a forward port with destructive effect. She then passed the *Congress* within two hundred yards, receiving her broadside and delivering one in return. The discharge of the *Congress* apparently had no effect. That of the *Merrimack*, on the contrary, was fearful. Most of the men hit were killed outright. A single shell dismounted one gun and killed or wounded every man of its crew. After this the *Merrimack* kept steadily on up the river. The crew of the *Congress* in their pitiable inexperience thought she was beaten off, and began to cheer. They were soon undeceived. She headed for the *Cumberland*, whose guns, though well served, were as useless as those of the *Congress*. When near enough, she put her helm hard a-port and drove her ram into the *Cumberland's* sides. The heavy timbers and thick planks were crushed as if they had been sugar-frosting. The fine sloop filled rapidly and sank in deep water in a few minutes. Some small steamers and boats from the shore gallantly put off to the rescue, and saved large numbers in the water.

While this was passing, the *Congress* was found to be on fire in four places. One of these was near the after-magazine. This fire was never extinguished. With the fate of the *Cumberland* before her eyes the first care of the *Congress* was to get into shallow water. She set her jib and topsails, slipped her chains, and, with the help of a tugboat, under a sharp fire from the smaller rebel gunboats, ran on the flats that make off from Newport News Point. The tide was on the ebb. As it fell the frigate heeled over, leaving only her stern guns to bear. When the *Merrimack* had finished with the *Cumberland* she dropped down the river again and took up a position about one hundred and fifty yards astern of the *Congress* and raked her fore and aft with her eighty-pound shells. The other steamers concentrated their fire on her from a greater distance. The state on board was now dreadful, and soon became desperate. The bulkheads and partitions between decks had been shattered by shells and knocked away by axemen, making way for hose to keep down the fires. Men were falling at every shot. The shells searched them out everywhere. Wounded men taken to the cockpit were killed there while waiting their turn with the surgeon. Others were laid in rows on the cockpit deck, drenched with icy salt water, which had to be sluiced over it to keep the fire away from the shell-room hatch. Once when the fire of the remaining guns slackened it was found that the line of men stationed on the berth-deck to pass "full boxes" had all been killed or wounded. Soon the last gun was disabled. No succor was to be seen. The ship was defenceless. She had borne her hopeless torture over an hour. To stop useless slaughter she hauled down her colors. A boat from the *Merrimack*, and subsequently one of the smaller steamers, boarded the prize and took off some prisoners. The *Congress* could not be got off. It was slow work to remove her wounded. It would have been scandalous to blow her up full of them. It was concluded to leave her to the fire, which there was now no chance of extinguishing. The infantry on shore was making it uncomfortable for the captors to loiter on board longer; and in a few minutes—about four P.M.—the flotilla passed down to destroy the stranded *Minnesota*. Fortunately, the noble frigate was saved by the shallowness of the water in which she lay. Then the Confederates floated back to a delirious welcome at Norfolk, and the sun soon set on their short day of naval triumph.

Left to themselves, the survivors in the *Congress* plugged up the holes in her shattered boats, and, with some aid from the army, worked far into the night bringing ashore their wounded comrades. The officers came with the last boat. To bring it safe to land they had to go overboard in the ice-cold water and swim and wade ashore. About midnight the fire reached the magazine, and the ship blew up. Since dinner, of her crew one-third were killed, wounded, drowned, or taken prisoners. Before the explosion the *Monitor* had arrived in the Roads and had been ordered to the assistance of the *Minnesota*, much as a terrier might be set to protect a bull. There she quietly passed the night under the shadow of the great ship, ready for her timely and famous service of the next day. But in this the author apparently took no part.

The narrative ends with the two bombardments of Fort Fisher. Subsequent voyages are kept for another volume, which the public is encouraged to hope for. If in this the hero is represented as being as much of a Jonah as in the first one, there will be little fear of its tempting any but the boldest boys to run away from home to go to sea.

Scientific Memoirs: Being Experimental Contributions to a Knowledge of Radiant Energy. By John William Draper. (New York: Harper & Brothers. 1878.)—It may be a debatable question whether the winning of scientific recognition is more determined by ethical principles than the acquisition of wealth is. If an honest, capable, and industrious man fails to acquire a fortune so rapidly as his more stupid neighbor, it is vain for him to demonstrate to the world that he is the one who is entitled to the largest share of success. We should be sorry to suppose that it was equally useless to demonstrate to the scientific world that an investigator whom it had long overlooked was really entitled to the highest recognition—indeed, the case of Dr. Draper himself shows that it would be a mistake to do so; yet it is certain that such recognition often seems to depend on circumstances as little capable of judicial examination as those which determine success or failure in other walks of life. One who reads between the lines of the present collection of Professor Draper's papers may see in it a disposition to show the scientific reader that one of the pioneers in the experimental study of the radiation of heat and light has been strangely overlooked. He was an active worker in this direction when some of our present workers were not born, and many of our present leading men took their first lessons in chemistry from his book on the subject.

Undoubtedly the most interesting chapters in the book are those on spectrum analysis, which show that the author is to be added to the list of those who preceded Kirchhoff in suggesting and applying this wonderful method; doing everything, in fact, but complete the invention and generalize the principles on which it rests. It has sometimes been said that when a scientific problem is once clearly stated it is half solved. Thirty years ago our author stated and attacked the problem of spectrum analysis so clearly that nothing remained but to answer the question by continuing his experiments. "Can any connection be traced between the chemical nature of a substance, or the conditions under which it burns, and the nature of the light it emits?" "It is," he adds, "to the discussion of that problem that this memoir is devoted." We question whether any one had ever before stated the problem so fully and attacked it so directly. Unfortunately, his attack was not carried so far as to lead to any new generalization in the line of spectrum

analysis. He examined the spectra of various flames, and thought they enabled him to divide flames into two classes, according as they did or did not contain incombustible matter. In those flames which were very faint he saw bright Fraunhoferian lines of different colors, but he failed to notice that these lines were characteristic of gases, and, by their endless variety, capable of being used to distinguish the special gases of which the flame was composed. How he could in this way have missed the capital discovery when he had it before his eyes is an interesting question. The principal reason is probably to be found in the lack of attrition with other minds engaged in like courses of thought. This lack is the greatest drawback to the continuous prosecution and persistent following up of scientific investigation in a country such as ours was a few years ago. Had Dr. Draper had fellow-laborers and rivals to discuss his methods and results, and suggest fresh ideas, it is hardly conceivable that he would have failed to follow out the investigation in which he made so good a start. With a greater familiarity with the literature of the subject we can hardly doubt that he would have devised some better theory of the cause of the dark lines in the solar spectrum than those he advanced. Sir John Herschel had already suggested that they were due to a selective absorption in a solar atmosphere, and Draper himself had long before shown that some of them were due to absorption by the earth's atmosphere. Combining Herschel's theoretical view with his own experimental results, he could hardly have failed to conclude that they might be entirely due to gaseous absorption. But the historical fact seems to be that no such generalization suggested itself to his mind ; on the contrary, the idea he repeatedly expresses is that the existence of the dark lines depends in some way upon the nature or qualities of the luminous source itself rather than on an external cause.

Describing things simply as they are, without enquiring whether they ought to be different, we find it a general fact in the history of inventions and scientific discovery that the largest portion of the advantage and credit of a result is divided among a very small fraction of those who contribute to it. The general rule is that the one who, by ever so small a modification, makes the invention work in practice, or who, by generalizing the results of his predecessors, distinctly enunciates a law of nature, reaps the lion's share of the credit. It will be readily seen that under the action of this rule our author might be passed over, as one who had not carried his researches to such a point that they would bear fruit without farther generalization. It is, however, worth while to note a growing feeling on the part of his countrymen that full justice has not been done him in the past, and a disposition to render him that credit now which he ought to have received a quarter of a century ago.

We have taken Dr. Draper's researches in spectrum analysis as the text of our remarks. These, however, fill but a small portion of the volume, less than one-fifth, and by no means exhaust the scientific claims of the author. The various memoirs cover the field of radiant energy, and especially of the chemical action of light, to so wide an extent that it is impossible to enter into details. It will suffice to cite, as an example, that we here have the first, if not the only, American contributions to the theory of the daguerreotype, and that a daguerreotype of the moon taken nearly forty years ago by Dr. Draper was the first "photograph" of a celestial object ever known to have been taken.

The First Violin. A novel. By Jessie Fothergill. [Leisure-Hour Series, No. 101.] (New York : Henry Holt & Co. 1878.)—We have read this story with a good deal of entertainment and interest, though it would have been better had it been a third shorter. It reveals at frequent intervals an unpractised hand, and is, presumably, a first or second effort at fiction. A young English country girl, May Wedderburn, gifted with a fine voice, is the heroine ; the "First Violin" is the hero of the romance. The story is told alternately by May herself and the hero's friend, Friedhelm Helfen, not in letters, but in the first person, as separate narrators. May has two sisters, and at Skernford, the quiet English town where her father the Vicar lives, attracts the attention of a rich but bad Englishman, Sir Peter Le Marchant, who proposes marriage to her. She rejects him, whereupon her sister Adelaide, worldly and proud, and with a profound confidence in her own ability to manage any husband she may marry, secures him. But meantime May has been taken out of England by Miss Hallam, an aged spinster, of eccentric but benevolent character, to whom she has confessed her horror and detestation of Sir Peter. To Germany they repair, Miss Wedderburn as a sort of companion. At Cologne she misses her way and loses herself in the railway station, when she meets a stranger of romantic and impressive aspect, one who has seen much of life but has not been spoiled by it; he gives her a good deal of valuable information about the trains for Elberthal, the place to which she is going, departing somewhat from the strict truth (and who could blame him ?) for the sake of prolonging the interview, and finally persuades her to lunch with him and go to the Cathedral, where she hears for the first time Bach's Passion music, and altogether the two have what would be called in some parts of our country "a mutually agreeable time." As she has no money, she is obliged to let him foot the bills, and, when she finds that he too is going to Elberthal, makes him promise that he will allow her to liquidate the debt there. Arrived at Elberthal, it is speedily discovered that she has a very fine voice, and Herr Von Francius, the musical head of the place, decides that she must cultivate it. At Elberthal, too, she again sees Herr Courvoisier, the stranger of the Cologne depot, who turns out to be the first violin of the Elberthal orchestra. Not being accustomed to meeting gentlemen in such positions, she is overcome with a conflict of emotions and cuts him. Consequently he cuts her on the next opportunity, and for some reason refuses to make up the misunderstanding ; so that the first violin and Miss Wedderburn go on living side by side in the little German town of Elberthal (she still owing him three odd thalers) without even a speaking acquaintance.

About the first violin there is always something mysterious, and his way of life is a source of considerable curiosity to his neighbors. He lives with his child, the little Sigmund, and his friend Helfen, but without mingling with other young men, or sharing their sports or conversation, devoted to his violin and wrapped up in his child. Helfen is attached to him because one fine day he was rescued from a fit of the blues, which would soon have made a suicide of him, by the sudden appearance of Herr Courvoisier, and their friendship has ever since been of the closest kind. But even to Helfen Courvoisier does not talk of his past, but darkly hints that at some not distant time his child, Sigmund, must leave him, not to return—why, he cannot or will not explain. Meantime, there is at Elberthal, as at so many other places, a prying, inquisitive woman who, for reasons of her own, does not wish this mystery to continue. Therefore she suggests to one Karl Linders, a common friend of Courvoisier and Helfen, that there are disagreeable stories afloat about the former which he ought to be given an opportunity to contradict. Karl Linders accordingly asks him, in a bluff, off-hand way, to authorize him to say that it is a lie that on a certain occasion he forged and raised money upon a negotiable security. To the amazement of all, Courvoisier neither denies nor confesses, and public opinion in Elberthal settles down to the conviction that the mystery about him is that he is a forger. It is perhaps unnecessary to say that neither May Wedderburn nor Friedhelm Helfen believes a word of the story. Courvoisier goes off, serves in the German army through the Franco-Prussian war, and finally meets Miss Wedderburn again on a sort of a raft borne down the Rhine by a sudden freshet, which has carried them both off unawares. On this raft their troth is plighted, but at the same time she learns that he is under a horrible ban, his fate being such that he must ever be supposed guilty of a forgery which neither he nor she will, under any circumstances, be able to explain. This does not daunt Miss Wedderburn, however, and they get off the raft, as we have said, betrothed. After the raft adventure the reader feels that he must be approaching the end, and so it is. It should have been said before that Sigmund and his father (one of the best things in the book is the description of this strange musical child and his relations with his father) had now been for a long time separated. The child is growing up in the castle of his uncle, the Graf Bruno von Rothenfels, who is, in fact, the brother of the pretended Courvoisier. He still pines for his father, and finally has a stroke of fever, which, happening about the same time that May Wedderburn visits the castle, leads to the outcast being sent for, when the whole forgery business is satisfactorily cleared up. The forgery had really been committed by his wife, the mother of Sigmund, and to conceal her shame he had submitted to ignominy, social degradation, a life of exile, and separation from his son. In this fantastic sense of honor we seem to detect the hand of the female writer of fiction. There could have been no earthly reason for the Count's allowing the mistake to continue after his wife's death, even supposing that it was worth while to allow it to be made originally, inasmuch as the sum total of disgrace must necessarily have been greater for the family to bear, if it were popularly supposed that a member of it were a forger, and for the son to bear, if he were to grow up under the stigma, than if the fact had been confessed that the crime had been committed by a frivolous woman, who might be supposed to have hardly known what she was about. As moralists, we respectfully advise those who are about

to confess forgery to screen their wives, to think twice about it. To writers of fiction who are in search of the highest pitch of self-devotion and sacrifice we commend some other sort of self-obliteration. 'The First Violin' will be found interesting as a picture of German musical life.

The Story of the Christians and Moors of Spain. By Charlotte M. Yonge, author of 'The Heir of Redclyffe,' etc. (London : Macmillan & Co. 1878. 16mo, pp. 299.)—Miss Yonge has perhaps done more than any other person to make the stories of the Middle Ages accessible and familiar to young people of the present generation, and a new book of this class from her is always welcome. The present publication is of a more ambitious character than her earlier works, inasmuch as it is not merely a collection of stories, but to all intents and purposes a history of the Spanish peninsula down to the close of the Middle Ages. On the whole it must be admitted that she is not so successful in the field of consecutive history as in that of historical sketches. The narrative chapters are excellent, and display her best qualities as a writer ; for example, the chapters upon Al Mansour the Invincible, the Cid, Peter the Cruel, and the Fall of Granada. But the general historical chapters, summing up briefly the annals of the Moorish and Spanish kingdoms at various epochs, are not so good. There is far too much detail, and there is no skill in grouping the events and showing their connection with one another ; the result is a lack of clearness and coherence. So it comes that it is not very easy to get a clear notion of the succession of dynasties, and the relations of the petty kingdoms to one another. The kingdom of Portugal—perhaps the most important, and certainly the best governed, of the Christian kingdoms during the fourteenth century—receives very scanty notice ; and the great fact of the dynastic history of Spain during the Middle Ages—the growth of the kingdom of Castile and Leon—is quite inadequately treated. The central fact in this growth, indeed, the union of Castile and Leon, is not correctly stated—the error arising from a confusion between Alfonso VIII. of Castile and Alfonso IX. of Leon. The former is always called Alfonso IX. (p. 179, etc.), and his grandfather, the "Emperor," Alfonso VII., is called Alfonso VIII. ; while the true Alfonso IX. is called simply Alfonso of Leon (p. 180), and no Alfonso VII. is given at all. Hence the list of the "Kings of Asturias (!) and Leon" (p. x.) mixes strangely the kings of the two countries. Ferdinand III. (the Saint), who united the two kingdoms in 1229, was son of Alfonso IX. by a daughter of Alphonso VIII., and was himself father of Alfonso X., the Wise. On the same page the two Alfonsos of Aragon are wrongly numbered. On page 169 the date 1148 should be 1158 ; on page 240, 1362 should be 1369.

It is a mistake to speak, as is constantly done, of the *Moors* before the Almoravid conquest in 1091. The correct statement is made on p. 154, where the earlier conquerors are called Saracens, as they should be. This is more than an error in name, inasmuch as the Moorish conquest was a veritable epoch in the history of the Moslems in Spain ; the wilful use of the wrong term, therefore, when it was known to be wrong, is inexcusable. We have on page 52, in relation to the establishment of the Kingdom of Aragon, a statement which is, to say the least, ambiguous : that the people met in the *Cortes* "and had laws, named *fueros*, which gave them rights," etc. The *fueros*, which form so important a feature of the constitutional history of all these kingdoms, were not ordinary laws, but came nearer to what we should call *charters*, being the organic law for the institutions of local self-government—as well rural as municipal—in which, as is well known, the Spanish kingdoms were in advance of all the other nations of Europe. Probably few persons would agree with the author when (p. 2) she calls Theodosius the best of the Roman emperors. It is, no doubt, a slip of memory when, on p. 238, she speaks of "the Schismatical Pope" of Avignon in 1366. At this date the Avignonese pope was all the pope there was ; the Schism did not begin until 1378.

The best feature of the book is where passages from ballads are introduced in illustration of the stories. Indeed, if the author had carried out this plan more generally—had made a book like her 'Cameos,' just a succession of stories, and illustrated them liberally with ballads—she would have made a book at once characteristic and unique.

The Colored Cadet at West Point. Autobiography of Lieut. Henry Ossian Flipper, U.S.A., first graduate of color from the U. S. Military Academy. (New York : Homer Lee & Co. 1878.)—The disposition of individuals to submit to a certain intellectual dependence on the majority is well known in colleges under different names, and at the United States Military Academy by the expression to "bone popularity." To this was due the social isolation of the colored cadet Flipper. Numerous instances occurred in which cadets assured him privately of their respect and good will, but avoided or abused him in public in order to keep in the fashion. It became "the thing" to cut Flipper before his talents and amiable qualities were known, and the feeling against him established itself so firmly that it was not until graduation that his fellow-cadets ignored the differences between the colored man and themselves. Except this continued isolation young Flipper had few trials to bear, and these were lightened by the remarkably sensible view which he took of his own position. Knowing the strong prejudice which exists against his race, and understanding the embarrassment of those obliged to associate with him while still, as the result of early training, regarding him as their inferior, and contemplating the possibility of some day being commanded by him, he generously found excuses for those who injured him, and fully appreciated any conduct which tended to improve his position. Flipper's success at the Academy did not so much depend upon the willingness of his brother-cadets to receive a negro among them as it did on the manner in which he himself behaved, and this, happily, was unexceptionable. With Smith, the former colored cadet, the case was very different. His attitude was constantly belligerent ; he made no allowance for natural prejudice nor took any pains to overcome it, and his mental outfit was too slender to redeem his want of tact. Flipper's manly bearing and great good-nature at last disarmed his opponents. After alluding to a few cadets who ill-treated him purely from an excessive dread of being "cut" under suspicion of a partiality for "nigger" society, Flipper says : "From the day I entered till the day I graduated I had not cause to utter so much as an angry word." There were gloomy moments when the young man felt his isolation severely, and in some of these his feelings found relief in writing bad verses, of which he has unfortunately given us a specimen.

The *raison d'être* of this book is no doubt a supposed desire on the part of the public to know how the first colored cadet was treated, but that this had already been amply gratified by the press is implied in Lieut. Flipper's remark, on his being given the wrong name in a newspaper : "Of course everybody knows that my name is not William." An interesting account of customs, slang terms, and cadet life generally may save the book from being considered superfluous. Lieut. Flipper describes his Academic experiences with much spirit and attention to detail, telling everything there was to tell, and that in an ingenuous way. He discloses among other military qualities the regulation tenderness for the fair sex, and mentions occasions when he yielded himself "to pure enjoyment such as is found in woman's presence only." He looks back upon his Academy life with true pleasure, and writes of it with enthusiasm, which is as creditable to the Academy as it is to himself. The book is awkwardly put together, and contains newspaper clippings *ad nauseam ;* its literary faults may be overlooked in consideration of the author's profession.

Selections from the Poetical Works of Heinrich Heine. Translated into English. (London and New York : Macmillan & Co. 1878.)—"The first duty of any translator of Heine's verse is to admit the impossibility of doing justice to the incomparable grace and charm of his style. Of all poets he is perhaps the most untranslatable, and yet, by a strange perversity of fate, which he himself would have been the first to appreciate, the experiment is found to have a peculiar fascination not easy to resist." So runs the preface of this pretty, anonymous volume, and the truth of the remarks quoted prepares one for the more than ordinary success of the translations which follow. To begin with, what takes them out of the common is the absence of stiffness and of unidiomatic expressions which are the invariable penalty of strict adhesion to the form and letter of Heine's verse, especially in the case of the shorter metres. One other liberty was necessary before the English product could become poetry and not mere rhyming, and that was to alter the stress and proportion of the original as the genius of our language not less than the translator's exigencies required ; to omit lines deliberately, or to expand where fidelity to the pattern would have squeezed the poetry out ; and, above all, to maintain elevation of style whenever the expression drops, as it so often does with Heine, to the colloquial or even vulgar. The failure to apply this correction, however pardonable as the result of conscientiousness or reverence, nevertheless accounts for the small progress that has been made towards naturalizing Heine in our English anthology. The translator with whom we are dealing has been saved by his artistic sense.

We do not, however, assert for him a more than relative superiority. Sometimes he appears without good reason to have preferred a paraphrase

to literalness, and perhaps if challenged he could not always defend his larger license. But in any comparison of him with his predecessors the excellence of his method will certainly be confessed. Such a comparison may be instructively made with Mr. Charles G. Leland's complete version, which always suggests more truly the German text, and almost never blinds the reader to the fact of its being a translation, and in which the style is recklessly faithful. From the volume before us we have room only for a short specimen ('Lyrisches Intermezzo,' xxv.):

"Two friends, when they are parting, say
'Farewell,' with many a sigh;
They wring each other's hands and fall
To weeping bitterly.

"But we, what time our parting was,
Shed not a single tear;
Our sobbing and our sighing came
In after days, my dear."

It may not be superfluous to remark the traces of Heine observable in certain poems of Longfellow's and of Lowell's. The latter's "Ember-Picture" is quite in the manner of the elder poet.

WILL BE PUBLISHED NEXT WEEK.

MRS. FANNY KEMBLE'S

Records of a Girlhood.

Large 12mo, with Portrait.

MONCURE D. CONWAY'S

Demonology and Devil-Lore.

Two volumes 8vo.

HENRY HOLT & CO., NEW YORK.

February Atlantic.

CONTENTS:

The Career of a Capitalist.
A paper of great interest, by the author of 'Certain Dangerous Tendencies in American Life."

A Roman Holiday Twenty Years Ago.
By William W. Story.

A Prairie-Nest.
A Poem. By Lucy Larcom.

Musicians and Music-Lovers.
By William F. Apthorp.

The Modern Martyrdom of St. Perpetua.
By Harriet Beecher Stowe.

The Europeans, and Other Novels.
A striking critical essay.

The New Catholic Cathedral in New York.
By Clarence Cook.

The Recent Great French Duel.
An irresistibly amusing paper, by Mark Twain.

Three Songs.
By Sallie M. B. Piatt.

Limited Sovereignty in the United States.
A political article of deep interest.

The Lady of the Aroostook.
Chapters 15–21. By W. D. Howells.
One of Mr. Howells's most delightful stories.

International Copyright by Judicial Decision.
By Arthur G. Sedgwick.

London Streets.
By Richard Grant White.

Reminiscences of Bayard Taylor.
By R. H. Stoddard.

With other Essays, Poems, The Contributors' Club, and Criticisms of New Books.

PORTRAIT OF LOWELL.—A fine large portrait of JAMES RUSSELL LOWELL, uniform with the previous *Atlantic* Portraits of LONGFELLOW, BRYANT, and WHITTIER, will be furnished, to *Atlantic* subscribers only, for $1.

TERMS: $4 a year, in advance, *postage free;* 35 cents a number. With superb life-size portrait of LOWELL, WHITTIER, BRYANT, or LONGFELLOW, $5; with two portraits, $6; with three portraits, $7; with all four portraits, $8.

HOUGHTON, OSGOOD & CO., BOSTON.

Socrates:

A Translation of the Apology, Crito, and Parts of the Phædo of Plato.

An Introduction by Prof. W. W. Goodwin, of Harvard University. With two vignettes of Socrates and Plato. 1 vol. 12mo, cloth, gilt top, $1 50.

"The translation, although not claiming to be literal, could hardly be bettered, and the words of the philosopher are clothed in the purest, simplest, and most expressive English. Rarely has a work been translated from the Greek that so faithfully preserved the spirit of the original."—*Boston Courier.*

"The translation is supremely good, rendering the original into pure, simple, direct, and lucid English. Such a translation as is here offered makes the reading of the original well-nigh superfluous."—*N. Y. Evening Post.*

"The most attractive, original, and sensible life of Socrates that we have anywhere seen."—*Chicago Tribune.*

PUBLISHERS,
Nos. 743 and 745 Broadway, New York.

ST. NICHOLAS,

THE CHILDREN'S ART MAGAZINE,

Which has reached a total circulation, during the past year, of nearly three-quarters of a million copies, is steadily increasing its attractions and deepening the impression in its favor. The *Western Christian Advocate* calls it

"THE PRINCE OF MONTHLIES FOR BOYS AND GIRLS."

The *Episcopal Register*, the *Churchman*, the *Evangelist*, the *Interior*, the *Congregationalist*, the *Christian Intelligencer*, and all our great religious weeklies unite with the secular press in giving it the very highest commendations as "a magazine beautifully illustrated, carefully edited, and sustaining the highest moral standard." A new term has been invented by the wife of an eminent statesman to indicate a peculiar excellence. She says: "It contains more APPLIED CHRISTIANITY than anything else I have been able to place in the hands of my children."

A SERIAL STORY FOR GIRLS.

"Eyebright," by Susan Coolidge, whose books are so popular with both boys and girls, with illustrations by Dielman, begins in February, and is to run to the end of the volume.

STOCKTON'S STORY FOR BOYS,

"A Jolly Fellowship," illustrated by Kelly, begun in Nov., will also end with the volume.

"Half a Dozen Housekeepers," a short serial begun in November, is already completed.

1878. *SPECIAL OFFER.* 1880.

New subscribers for 1879 will be entitled to receive the back numbers of the volume free—fourteen months for $3—viz., from Nov., '78, to Dec., '79, including the Christmas number, with contributions by Whittier, Warner, Mrs. Burnett, Mrs. Dodge, and others.

ST. NICHOLAS FOR FEBRUARY,

the current number, has such a list of good things that we can only mention a few. There is a poem by H. H.; a true story of South African adventure for boys; a charming frontispiece, *Modern Improvements at the Peterkins'*, by Lucretia P. Hale; and, with Reményi and Wilhelmj in this country, young people will be interested in an article "About Violins," and a story of Paganini's life, "*Little Nicholas, and how he became a Great Musician*";

and Mr. Charles Barnard gives a glimpse of child life in the great English mills; while there are pictures, tender and comic, grave and gay.

Price 25 cents a number; $3 a year; or 14 numbers from November, 1878, until 1880) for $3.

Subscriptions received on these terms by all booksellers and postmasters. Persons wishing to subscribe direct should write name, post-office, County, and State in full, and send with remittance in check, P. O. money-order, or registered letter, to

The Nation.

NEW YORK, THURSDAY, JANUARY 23, 1879.

The Week.

NOBODY, we suppose, really believes that the Senate passed the Arrears of Pensions Bill (House Bill No. 4234) from pure motives of national gratitude. There was a long debate over a simple interpretative amendment designed to prevent fraud and abuse (for which Mr. Ferry, of Michigan, deserves great credit), and not a single respectable excuse was offered for refusing to adopt it. Yet, though it mustered 20 votes against 27, and the bill will take at least $20,000,000 out of the Treasury, only four Senators had the courage to vote against it finally, and these all Democrats and not one a President *in petto*. The other great achievement of the Senate was a warm debate in executive session over the New York Custom-house appointments, Senator Conkling's voice of course being heard denouncing Secretary Sherman's charges against Collector Arthur as frivolous and worse. The matter was referred to the Committee on Commerce for investigation. The Democratic Senators, after putting their heads together, introduced resolutions to offset Mr. Edmunds's on the Amendments. They match his glittering generalities, and end by denying that the United States have any voters of their own creation in the States, or that they have any jurisdiction over a denial or abridgment of the right to vote unless effected "by the authority of and in obedience to the laws of a State." The House passed on Wednesday week, 117 to 72, Mr. Wood's bill providing for the issue of three per cent. Treasury certificates of deposit, of the denomination of ten dollars, convertible at any time, with accrued interest, into four per cents. This, according to the majority, strenuously backed by Gen. Garfield, would be a boon to the poor man by giving him a national savings-bank and rescuing him from communistic designs on the Government. According to Mr. Hewitt, the only gainers by the measure would be the bloated banks, which are now accepting two per cent. interest from the trust companies, and would gladly take three from the Government. To this no answer was made, nor, we believe, can there be any. The House also passed a bill authorizing the receipt of greenbacks for customs, and one providing for the exchange of four per cents at par for five per cents, allowing three months' interest from the time of surrender. On Tuesday the Potter Committee was on request allowed $10,000 to investigate the cipher despatches. The chief opponent of the appropriation, on the ground of the despatches being a private concern, was the Essex statesman who overhauled the barrel of impeachment telegrams, and had to be fenced off from the click of the telegraphic instrument at the Capitol.

On Saturday the House of Representatives came to a vote on the Geneva Award Bill, and after adopting Mr. Frye's amendment to the majority bill, excluding the insurance companies, and rejecting the majority bill, with the amendment, it passed Mr. McMahon's substitute bill. This revives the Court of Commissioners of *Alabama* Claims, and sends all the claimants to it, except the underwriters. Under it the "war-premium" and "exculpated-cruiser" claimants would make a rich haul, but the insurers will now of course do their best to defeat it in the Senate, so that if the session ends without the passage of any bill on the subject at all, leaving the money still in the Treasury of the United States, it will not be very surprising. The *Tribune* speaks of the passage of the bill as a proof of the honesty of Congress, and at the same time holds it up as a sort of warning to "British moralists," who we hope will now stop, as they must see their casuistry and hypocrisy do no good. In fact, we think the moralists of every nation had better let the subject alone. It may be worth while, morality apart, to mention one or two facts connected with the subject which the *Tribune* seems to have overlooked. First, that the United States collected the Geneva fund for individual claimants; second, that the war-premium claims were decided by the Geneva tribunal to have no validity; third, that the "exculpated-cruiser" claims are claims on account of the acts of vessels for which the tribunal expressly decided under the Treaty that England should not pay any money. To any one who will disprove any of these statements we will pay the sum of $1,000, to be added to the Geneva Fund now in the hands of the Government, and to be applied, as that has already been applied by a prudent secretary, to the reduction of the national debt. We trust that in the Senate the international bearing of the proposed scheme of distribution may be brought out. As our international position will, in the future as in the past, be, in all probability, that of a neutral nation, a recognition of claims upon a neutral for damages through "enhanced payment of insurance" may prove to have unpleasant consequences for us, as may also the payment of claims made in direct violation of a treaty and of an arbitration under it.

If the Army Bill reported by the Joint Commission does not pass, the Committee on Appropriations will present a bill of Mr. Hewitt's in order that some reduction in the expense of the Army may take place immediately. This bill distributes through all branches of the service a reduction of about 20 per centum. About four hundred officers will thus be rendered supernumerary, but they will not be retired unless they choose to resign with the usual advance of three years' salary. The elimination is therefore left to accident or voluntary action, but until it has taken place no new appointments will be made. After January 1, 1880, officers will be retired after forty years' service, or at the age of sixty-two years, and the next two graduating classes of the Military Academy will receive $750 and mileage to their regiments, but they will be ineligible to appointment in the Army until two years after graduation. There is no change made with regard to the Engineer Corps and some special officers. No promotions or new appointments will be made until all the reductions provided for in the bill have taken place. The Government would save by this means from $1,000,000 to $1,500,000 per annum.

The desire of inhabitants of the Pacific slope for the restriction of Chinese immigration has been brought to the notice of every Congress since the negotiation of the Burlingame Treaty in 1868. It has now taken the form of a bill to limit the number of Chinese passengers to be brought to this country to fifteen on any one vessel, and to attach severe penalties to a violation of the law. A report of the House Committee on Education and Labor accompanies the bill, recommending its passage. By a clause in the Burlingame Treaty the privilege of unlimited immigration is accorded to all subjects of the Chinese Empire, and acts of the California Legislature in opposition to this clause are void. The Committee, after citing precedents, declare that an Act of Congress is sufficient to overrule this provision of the Treaty, and recommend that such an act be now passed. If it be considered expedient to abrogate the Treaty, however, this is not the way to do it. A treaty made with a friendly Power on our own motion ought not to be set aside without notice to the other party through the ordinary diplomatic channels. Moreover, it is not open to us to reject some provisions of the Treaty and keep the others in force. The Chinese will not submit to this, and if we repudiate whatever we do not like, they will do the same thing.

It must be borne in mind, too, that in legislating against the Chinese the Republican party, at least, would be getting into more serious trouble than that into which the Southern question has already plunged it. The party has adopted and is maintaining with

great vehemence, at the South, the doctrine that neither race nor ignorance in any way disqualifies a man for citizenship; that, in fact, nothing disqualifies a man for it but foreign birth, a defect which is cured by naturalization, and that objections on the part of anybody to carrying on a government with a man, or being governed by him, or working with him in any way, on account of the absence of American ideas or American training, are futile, and ought, if possible, to be put down by law. The party is upholding these doctrines too with regard to a race which is, judging by the past, far inferior to the Chinese in constructive power, and far below them in culture. One has only to mention these things to show that the Chinese question is one which calls for a good deal of patient investigation, and is as yet by no means ripe for action, and least of all for such action as the House Committee proposes.

The Utah polygamists have been, as we expected, much stirred up by the Reynolds conviction. A deputation of Mormon ladies of polygamous opinions has waited on the Senate Judiciary Committee to obtain a repeal of the Act of 1862, as entailing great hardship on polygamous women and children. The anti-polygamists at Utah, on the other hand, have held a meeting, in which they called for still more stringent measures, such as the exclusion of polygamists from jury-lists, and permission to prove polygamous marriages in criminal trials by the same evidence as in civil cases. This, they say, is "all they ask." They then accuse the Mormons of dram-drinking, and declare that at the meetings of the Mormon priesthood, presided over by Brigham Young, it was the custom of these ecclesiastics to confess that they committed adultery freely "outside of their polygamous relations." This, although produced as a "well-known fact," one cannot help doubting, however. Senator Christiancy has brought in a bill making further provision for the suppression of polygamy, but giving the President extensive amnesty powers, and allowing till November next for the birth of polygamous children without prejudice to their legitimacy—probably the oddest provision ever laid before a legislative body.

A remarkable diversity of opinion is exhibited among the silver-men on the question of taking the trade-dollar and the Mexican dollar into the list of legal-tender coins. The silver-men pure and simple, of whom Senators Voorhees and Beck are acknowledged types, hold that if silver dollars are good things we cannot have too many of them, and that the bullion of which they are composed is just as well adapted to the manufacture of standard dollars as any other bullion. They propose, therefore, to make them receivable for Government taxes and duties, and to direct the Treasury to recoin them into dollars of 412½ grains each. These measures are received with such disfavor by another section of the party—to wit, the owners of silver-mines—that, according to one of their organs, if they are passed by Congress "Messrs. Voorhees and Beck will be hanged in effigy in every mining camp in the country." "It is regarded," continues the same organ, "as a villanous job from beginning to end, and the utmost astonishment is expressed at the conduct of the so-called silver Senators in fathering so outrageous a measure." What is wanted of the Government is not the multiplication of silver dollars generally but the steady and continuous purchase of *our* silver. The doctrine of protection has taken many queer guises in this country, but none so ridiculous as that of disbursing two millions per month from the public Treasury to steady the market of a declining product. This species of folly may last a year longer. Meanwhile, we trust that Senators Voorhees and Beck will not be frightened by the prospect of hanging in effigy in every mining camp in the country.

The election of Mr. Conkling for his third term in the United States Senate followed naturally on his unanimous nomination in the Republican caucus, after a speech by Mr. Husted, one of the most active and wiry of the State politicians, in which the candidate was eulogized in a highly poetic vein in company with General Grant. The two, indeed, were represented as having jointly, if not severally, saved the Union, and then governed it with unparalleled wisdom and success. The excitement then increased, the orators trying to outvie each other in laudation, until Speaker Alvord made Conkling the peer of Webster, Calhoun, and Clay. If the performance had lasted much longer, "strong men" would have "begun to cry like children," as they did at the convention last fall, when Mr. Conkling restored "harmony in the party." The affair leaves the friends of the Administration in a somewhat ludicrous position, as they can hardly have supposed that it was for this they "harmonized" last summer. The wretched Democrats made an attempt to mar the beauty of the occasion by proposing to refuse Mr. Conkling a certificate, on the ground that the present Legislature is only a legislature *de facto*. The origin of this impudent suggestion is this: the State constitution directs the Legislature to take a State census every ten years, and in the next session after such census to redistrict the State on the basis of population, so that each district shall have as nearly as possible an equal population. This reapportionment, it is believed, would, if made in 1876, as prescribed, have given the Democrats a larger representation than they now have, but the Republicans, in view of this fact, and having the power in their own hands, resolutely refused to make it. The result is that the Democrats grumble and growl, and would like to make trouble, but happily, besides being wicked and ill-conditioned, they cannot help themselves.

Committees of the House and Senate of the Virginia Legislature, acting jointly, have passed a series of resolutions called forth by the action of Judge Rives, of the Federal District Court, in taking a colored criminal out of the hands of the State court on the ground that he had not enjoyed his rights under the Constitutional Amendments in having been convicted by a jury composed exclusively of white men. The resolutions, after laying down several elementary propositions touching the relations of the States to the Federal Government, pronounce the Civil Rights Bill and the Force Bill unconstitutional, and place in the same category all other bills which "provide, or attempt or profess to provide, for the performance by the United States of duties and obligations belonging to the States." The resolutions are very proper in tone and temper, and end by asking for legal provision for the prompt and effective supervision "by the United States Supreme Court of the judges of the inferior courts of the United States," and instructing the Governor to take proceedings in the name of the Commonwealth before the United States Supreme Court to secure protection and redress in the present instance.

Dun, Barlow & Co. have issued their annual circular for the year 1878, giving the number of failures in that year, as compared with the five preceding years. Their report shows what a slow process "touching bottom" is, for the number of failures in 1878 exceeded that in 1877 by 1,571, with liabilities exceeding those of 1877 by $40,000,000 In fact, there have not been so many failures since 1873 as last year. The increase over 1877 has been slight in the Eastern States, slight in the Middle States, slight in the Southern States, but very heavy in the Western States. In fact, of the 1,571 increase in number, 680 come from the Western States. On the other hand, the Western contribution to the amount of liabilities is smaller than that of any of the other divisions, showing that the trouble there has of late been mainly among the minor dealers and speculators. These comparisons are, however, very rough, as the Western division greatly exceeds the others in population. The only fact that can be deduced with certainty from the table is that the process of recovery had not begun in 1878, that the "dead wood" was still being cleared away, and that the President's opinion that we had been "walking on the bottom for some time" was not strictly correct when uttered in December. There seems to be little doubt that the present year will show a much better result, owing to the number of people who were expecting to fall fifty feet when resumption began, and have found out that their toes were only an inch from the ground. Most of them, having now

let go, are walking off to their business, looking a little sheepish, it is true, but still, more cheerful and hopeful than they have been for a long time.

The refunding of the public debt goes on with surprising rapidity, and during the week enough 4 per cent. bonds have been subscribed for to raise the total since the last week in December to $100,000,000. On Saturday and on Tuesday last the holders of $40,000,000 more 5.20s of 1867 (6 per cent. bonds) were notified that their bonds will be redeemed ninety days hence. This makes $110,000,000 of '67s notified for redemption since December 31 last. It is not a subject for rejoicing that the rate for money is kept so low as to breed wild speculation, such as has been seen at the Stock Exchange during the week (the prices of speculative stocks there having advanced ½ to 8 per cent.); nor is it a good thing that refunding is going on at a rate that brings back from Europe enough 5-20s of '67 to advance sterling exchange to the point that draws gold coin from here to London. The rates for money have been depressed, as the result of the operations of the banks in 4 per cent. bonds, to 1 to 2 per cent. for ninety-day loans where the collateral is made up of U. S. bonds, and to 2 to 3 per cent. where it consists of other securities. These rates are enough below even the reduced rates in London to furnish an incentive, entirely aside from the importation of securities from Europe, to transfer money hence to London. Accordingly, the rate for demand sterling bills has advanced to 4.89½, or the point which draws gold from here. It is proper to say that only the nominal rate is now 4.89½, the actual rate being 4.89; but even the latter is unpleasantly near to the point of danger. This danger has not been overlooked by the Treasury, and arrangements were made on Tuesday with a new syndicate to place not less than $5,000,000 4 per cents per month in Europe. The Bank of England discount rate has been reduced to 4 per cent. Silver in London advanced during the week to 50½*d.* per ounce, and the bullion value of the 412½-grain dollar here advanced to $0.8546. Silver in London fluctuated more widely during the year 1878 than during 1877. The lowest price in 1878 was 55¼*d.* per ounce about the time of the passage of the Bland Bill, and the highest price was 49½*d.* at the close of the year; the average price for the year was 52$\frac{9}{16}$*d.* per ounce.

The German budget has been issued, and although unfavorable, proves to be less so than was expected. The immense surplus derived from the French indemnity, which has been announced every year from 1872 to 1876 has been wholly expended, and there has been besides an actual deficit of eleven million marks. The Government being the principal proprietor of arable lands, forests, mines, and railways, its revenue has naturally been largely decreased by the prolonged commercial depression. The losses thus incurred have been supplied by a continual increase of direct taxation, notwithstanding which there is still the above-mentioned deficit. While thirteen per cent. of the British revenue, and twenty-five per cent. of the French, is derived from direct taxation, forty-five per cent. of the German revenue is so raised. Therefore it was with good reason that the Finance Minister stated in his budget speech that he dared not attempt an increase of direct taxes. It is not too much to say that during the last twelve years the taxes paid in the large towns have been tripled, while the resources of the people have sensibly decreased. It would be well if the exhaustion of the French indemnity left the treasury undamaged, but such is not the case. The surplus wealth of the late prosperous years has not simply disappeared, it has been spent on public works, many of which are still unfinished, and their completion will be a drain for years to come. The revenue for the coming financial year not only cannot supply the funds required to complete them, but it lacks ten million marks for the ordinary cost of carrying on the Government.

Switzerland is following in the lead of Germany by proposing a new tariff, which seems designed at once to place its budget on a firm footing and to revenge itself on other nations whose protective laws interfere with manufacturers of the Federation. The duties on English goods are so much increased that it is doubtful whether the new measure will be ratified, as there is a strong free-trade feeling in the French-speaking cantons, and the whole people depend much on England for articles in common use. One part of the new tariff, and the only one which especially concerns us, has already become a law, in accordance with which the "Federal Council is authorized, subject to the approval of the National Assembly, to impose on the products of states that do not treat Switzerland on the footing of the most favored nation, and whose tariff submits Swiss products to exceptionally heavy duties, such proportionate additional taxes [additional to those set forth in the new tariff] as they may deem necessary." This clause is evidently directed against the United States, whose high duties on watches, silks, and embroideries are severely felt by Swiss manufacturers. The wisdom of the new measure is another matter. A small land-locked country like Switzerland would be worsted in a war of tariffs; its extensive trade with Savoy would be greatly injured, while endless opportunities for smuggling would be afforded by the open French frontier. An increase of the taxes on spirits and tobacco, at present extremely low, would be a better way out of the difficulty.

The expected collision between the victorious majority in the French Assembly and the Dufaure Ministry occurred on Monday, after much preliminary intriguing and negotiation. The attack on the Cabinet was made by M. Senard, to whom the duty had been assigned by his party, and the main point of it was that the Ministry had not given satisfaction in its dealings with the administrative functionaries whom it found in power when it took office, meaning thereby that it had kept too many Monarchists in the service. But he admitted that a distinction ought to be made between those whose duties were purely ministerial and those who acted as the exponents of the policy of the Government towards the country, such as the prefects and certain classes of judges. On this head M. Dufaure was able to make a pretty good defence as to the past, and he admitted that the vote of the 5th of January made still more thorough purging of the service necessary, and, in fact, adopted M. Senard's views. The subsequent onslaughts of the Extreme Left seem to have been feeble, and, in the recess which followed, the Government and the Left came to terms, and a vote of confidence was passed.

Gambetta took no part in the debate, and there is much dispute among the Paris correspondents of the foreign press as to the precise part he played in the crisis—that is, whether he instigated the attack on the Ministry and failed, or privately stood by them. The language of his paper, the *République Française*, supports the former view. But the bulk of the Republican press stood by M. Dufaure, and he probably could not have been overthrown without causing a serious revulsion of feeling in the country against the Left. The whole proceeding curiously illustrates the anomalous nature of M. Gambetta's position, on which we commented last week. The Ministry properly speaking is the Ministry of the majority. Nevertheless in the debate the majority overhauled and criticised it in the attitude of an opposition, although, as was well known, it had nobody whom it dared put in its place, or whom the country would accept with confidence and tranquillity. It will probably take two or three years more to fit Gambetta for the position to which, according to the rules of parliamentary government, he is really entitled—that of President of the Council or President of the Republic. A good deal will now depend on his skill in keeping the revolutionary programme of the Extreme Left out of sight and out of mind, as to the part he will play in 1880, when Marshal MacMahon's term expires, and when the Republic will pass through its next great crisis. It is worth remembering that it is already half the age of the Second Empire. To have an air of real stability, however, it must last at least twenty-five years; twenty years having been the usual duration of French governments since the downfall of the old monarchy.

THE FUTURE OF GREENBACKS.

THE experiment of specie resumption is far enough advanced to afford some indications of the probable future of the greenback currency, whose fate was left undefined in the Resumption Act of 1875. That Act merely provides that on and after January 1, 1879, the Secretary of the Treasury "shall redeem in coin the United States legal-tender notes then outstanding, on their presentation," etc. No attempt to fix their status after redemption was made until May 31, 1878, when an act was passed by Congress prohibiting the cancellation or retirement of any more United States legal-tender notes under any pretence whatever, and providing that when any of said notes shall be received into the Treasury, by redemption or otherwise, "they shall be reissued and paid out again and kept in circulation." Since no method has been provided for paying any more money out of the Treasury than the annual appropriations call for, and since these appropriations are equalled by the annual income from taxation, the Act of 1878 would be inoperative if any considerable number of greenbacks should be presented for redemption. The Secretary would have no lawful means of paying them out and keeping them in circulation, although required by law to do so.

But no greenbacks have been presented for redemption; or, to speak precisely, more gold has been sent to the Treasury to be exchanged for greenbacks than greenbacks to be redeemed in gold, since the first day of January; which proves that the public do not want gold unless they have a specific use for it which greenbacks will not answer as well. This is the same rule or principle which sends to the Bank of England each day "on balance" all the gold in Great Britain not wanted for export, or to meet the exigencies of local circulation for transactions smaller than five pounds. Inasmuch as we use notes of as small denomination as any existing gold coin, there are no exigencies of local circulation here to be provided for out of the Treasury balance. Consequently the only draft of a commercial nature upon this reserve to be looked for is for export; that is, to meet balances of international trade. Any other demand for gold must be the result of apprehensions in the public mind that the Treasury supply will prove inadequate, or that silver may be eventually tendered in the redemption of greenbacks instead of gold. Up to the present time, however, not even the banks of New York have called for any gold, notwithstanding they can get it without expense to themselves. The banks of the interior, being at a disadvantage of one-quarter of one per cent. in the way of express charges for the transportation of gold, have drawn nothing, and will draw nothing hereafter, except as the result of apprehensions regarding silver. It may well be doubted whether the sluggishness of the New York banks in this particular is grounded in wisdom. They have declared that all their deposits are to be considered and treated as gold—not as coin, but as gold coin. The Treasury has asked and obtained admission to the Clearing-House as one of its members, for the purpose of settling its balances with the banks expeditiously and cheaply. One of its daily balances, and perhaps the most important of all, is the balance over for its legal-tender notes. There ought to be one place in the United States where promises-to-pay end, and where performance begins. The New York Clearing-House, which performs two-thirds of all the clearings of the country, is the most suitable place for such daily settlement; yet the Clearing-House has not asked its new member, the Government, to redeem a single greenback. All balances continue to be paid in legal-tender notes as before. It may well be doubted, we say, whether this policy is wise, for although it is something easier to make these settlements with notes than with coin, resumption ought to be put to a practical test from day to day, and all parties ought to become habituated to it. The drain upon the Treasury for this purpose would be trifling, amounting probably to not more than one-fifteenth of the Treasury reserve, and not more than three months' production of our own mines.

The fact remains, however, that no gold has been called for and that none seems to be wanted for domestic purposes. This indifference on the part of the public is likely to continue until something occurs to alarm the holders of greenbacks—to create a doubt in their minds whether the gold value which they now bear can be permanently maintained. Such doubts may be raised (1) by a large demand for gold for exportation, (2) by the prospect of silver instead of gold payments at the Treasury, (3) by an agitation in Congress or in the country for the disbursement of the Treasury gold for some other purpose than the redemption of greenbacks. It is inevitable that a time will come when more or less gold will be required for export, since it is one of our principal products, the output being about forty millions per annum. We cannot pile up and hoard all that we produce for ever, nor is it desirable that we should. The exportation of the surplus over and above our own needs is as healthy as any other commercial movement, and it is not likely to be large enough to put resumption in peril for many years to come. The recent funding operations of the Treasury have called several millions of 5-20 bonds from Europe, whose place has not been filled by foreign subscriptions to the 4 per cent. loan. It is possible that these bonds may come home faster than they can be paid for by our exports of merchandise, in which case there will be a temporary balance against us, to be discharged with gold. But this will not of itself occasion alarm, since the future payment of gold interest to Europe will be lessened *pro tanto*.

The continued coinage of silver on Government account is the most threatening element of the problem, for, although only a driblet of the stream gets into circulation, the reservoir grows from day to day, and is becoming an enormous bulk. Before the 1st of July there will be one thousand tons of this metal stored in the public warehouses, and ere Congress assembles in December there will be a raging controversy how to dispose of it. The silver-men will insist that it shall be forced upon the public creditors. This policy could never be put in force without precipitating a run upon the Treasury for all the gold in it. Secretary Sherman's policy of allowing the public creditors of every sort to take gold, silver, or greenbacks at their option is the only one compatible with safety to the gold reserve. Any agitation to reverse that policy approaching in fierceness that which ushered in the Silver Bill would deplete the Treasury of its last gold-piece before Congress could act upon the measure.

The spectacle of one hundred and forty millions of gold lying in the Treasury subject to the call of any holder of greenbacks, and yet uncalled for, has arrested the attention of discerning inflationists at the West, who now demand that the entire gold reserve be expended in redeeming interest-bearing bonds. "Why," they ask, "should the Government lose the interest on this vast sum of money? It is plain that it is not wanted for purposes of resumption; let it be used, therefore, to pay off the 5.20s." It is needless to say that long before any bill could be passed to carry these views into effect the whole amount would be wanted and would be taken by the holders of greenbacks, who are satisfied to keep legal-tender notes only so long as there is a visible stock of gold on hand pledged for their redemption.

Between the slow, inexorable movement of the Mint under the Silver Bill, and the erratic course of political opinion on this range of subjects, the future of the greenback currency is, to say the least, extremely precarious. A cataclysm wholly distinct from ordinary financial panics is liable to overtake it at any time and on very short notice. If a run upon the Government's gold reserve were started through either of these causes—if one-half of the outstanding greenbacks were lodged in the Treasury, and a corresponding amount of gold drawn out—the effect upon trade and industry would not be necessarily harmful, but more probably beneficial. It would, however, bring up for discussion and final settlement the question whether Government notes shall form a part of the permanent currency of the country. The objections to such a currency have been set forth in these columns so frequently that they need not be here repeated. Until the cataclysm comes it is

safe to assume that business will move in its customary channels, employing the same implements, tools, and methods that it has used since 1862, and that the gold reserve of the Treasury will not be disturbed.

THE NEW YORK SENATORSHIP.

THE election of Mr. Roscoe Conkling by the Republicans, without any opposition, for a third term to the United States Senate is a very interesting phenomenon. Most of what are called "thoughtful Republicans" disapprove of him, or only approve of him apologetically, or interrogatively, by asking you, "Who else is there?" The leading Republican papers do the same thing. The most that those who are friendliest to him say for him is that the absence of opposition shows what a "strong man" (*i. e.*, skilful politician) he is, and shows how completely he has beaten the Administration. A not uncommon way of supporting him in the press is what may be called the paternal method—pointing out that during his two terms in the Senate he has grossly neglected all the serious business of his office and has devoted himself to the promotion of his personal fortunes, which in the case of a man of his remarkable talents is very unfortunate, not to say reprehensible; but that it is to be hoped, now that he sees that this makes no difference whatever with his constituents, he will change his ways in his third term, and become what nature intended him to be—a statesman of the first order. There was in the New York *Times* of last Saturday a letter from a dissatisfied Republican on Mr. Conkling which, taken in connection with the editor's comments on it and its appearing in a paper which is by no means friendly to the Administration, is a useful contribution to the solution of the Conkling problem. The writer points out that Mr. Conkling shrank from the performance of his duty on that most important occasion, the last electoral count, in failing to vote on the counting of the Louisiana vote; that he kept dead silence in the Senate during the most critical period of the currency discussion; that in the canvasses immediately preceding the expiration of his own term in the Senate in 1872 and 1878 he displayed an abounding enthusiasm and prolific eloquence, while in the off years, when his seat was in no danger, he fell into delicate health; that in the canvass of 1876 he did not in his speeches make a single mention of the candidate of his party for the Presidency who had been preferred to himself, and in 1877 poured forth in full convention, on the heads of Republicans as old and faithful and upright as himself, a stream of coarse vituperation, simply because they happened to be friends of the Administration and its ideas. The writer further adds that if Mr. Conkling's career were to terminate to-morrow, "there is no conspicuous act of his—no original conception, no advocacy of any great public measure—to rescue his name from speedy oblivion."

All this is literally true. We have never seen any attempt to deny these charges or explain them away, and being generally accepted as true, they ought, combined with Mr. Conkling's obtrusive vanity and quarrelsomeness—usually serious defects in a politician—have brought his political career to an end, or a pause, six years ago. Now why have they not done so? How is it that shortcomings apparently so fatal as these do him no damage? He is not a great orator; he is not a great legislator; he is not a man of great or striking ideas; he has been tricky and inconstant in his support of his party; he has no reputation outside his own State; he has no hold on the mind of the country; he is associated with no great cause. If he retired from the political arena to-morrow, he would be forgotten as rapidly as "Tom" Murphy or Silas B. Dutcher. How is it, then, that he is re-elected to the Senate without opposition, or more than a slight murmur of opposition?

The usual malcontent Republican way of answering these questions is by repeating that Mr. Conkling is a bad fellow—or, in other words, that the very qualities which unfit him for high office enable him by some sort of hocus-pocus to seize and keep it. This reminds one of the explanation of Beaconsfield's success offered recently by an English peer, after much reflection—"That he had sold himself to the devil." It reminds one also of the account given by the New York *Times* recently of the political career of Moses, of South Carolina, who was promoted from the place of "Speaker and Thief" to that of "Governor and Wholesale Robber," apparently by the operation of some occult force within himself. The fact is, however, that to find out how so unprofitable a statesman as Mr. Conkling comes to be so easily retained in public life, we must study not Mr. Conkling himself but the party to which he owes his place. He does not, any more than Moses, live and move *in vacuo*. He is not a United States Senator by the grace of God or the force of his own genius. He goes back to the Senate because his party sends him back. Nor has he taken the party by surprise, as we see. It knows him thoroughly now, and is apparently content with him, just as in South Carolina it knew Moses when it made him "Governor and Wholesale Robber." Nor is the election of Mr. Conkling for a third term the sign of a special affection for him. He has shown no qualities to excite affection. He has not earned the favor of the public. There is, to do him justice, but little of the demagogue about him. His attitude towards his constituents is one of, on the whole, silent arrogance. He is not, in other words, although a "favorite son," in any sense a pet of the State. He is, we believe, a pet of the city of Utica, but not of any larger community, and no New-Yorker ever speaks of him to strangers with any pride.

What his success proves is the enormous power which "the machine" still possesses over the party, and the skill with which Mr. Conkling uses it. He was General Grant's favorite Senator, and the machine, as we now see it, may be said to have been built up under General Grant, and no one had more to do with building it up than Mr. Conkling. It was under General Grant that the party came into full control of the enormous number of offices created by the war, and into the full benefit of the prestige and influence which the possession of offices creates and diffuses, and nobody represents that influence and prestige so completely as Mr. Conkling. There were strong signs of revolt against him and his system in 1876, under the impression made by the great scandals of the previous four years, and a more vigorous reformer than Mr. Hayes might have overthrown him and taught the party that it might safely seek nobler instruments. But Mr. Hayes's timidity and failure satisfied the working politicians at a very early day that he was after all only an interrex, that Mr. Conkling represented what was most powerful and permanent in the party organization, and that the safest course was to adhere to him until the Hayes disturbance was over, and they have done so.

To make their adhesion effective Mr. Conkling needed two things more—viz., that the party should be sufficiently afraid of the Democrats to shrink from anything like internal dissension, and that it should be sufficiently wrought up about the condition of the South to make it indifferent about other questions. These have also been accorded to him. It is these things which account for the extraordinary fact that the senior Senator of the leading commercial State in the Union, and of one of the great financial centres of the world, has been able with impunity to manifest complete indifference to legislation affecting the currency and public credit at a most critical period. As long as these conditions last, too, we must expect to find the Republican party in the Senate largely represented either by men of Mr. Conkling's kind, or by passionate partisans filled with the memories of the war and eager to prolong them. A Senate so composed is not apt to be a very august or very useful body, but it would be unfair to blame the Senators for its composition, just as it will be unfair to blame Mr. Conkling for not having spoken on the Silver Bill, and for throwing his whole mind into the great Arthur-Cornell question. He has plainly done all that his constituency called for; it would have been very noble if he had done more, but he lays no claim to nobleness—he is satisfied if men think him skilful. The tendency of the party mind, to which he owes his success, is revealed also in the growing yearning for General Grant for a third term. A party which so openly acknowledges the scantiness of its resources both in men and in ideas cannot be said to have a very brilliant future before it; but it is hard to see how any widening of the horizon

can come until a larger body of Republicans than now shows itself is prepared to sacrifice "harmony" for other things.

THE FIRST INVASION OF AFGHANISTAN.

II.

SIR ROBERT SALE'S brigade was sent out from Cabul early in October, 1841, to put down an outbreak of Ghilzais, one of the most fanatical and warlike of the Afghan tribes, in the neighborhood of the Khoord-Cabul Pass, and finding the restoration of tranquillity more difficult than had been expected settled down at Gundamuck, on the road to Jalalabad. It was here when the rising took place at Cabul, and when matters began to look serious in the latter place was called upon by MacNaghten in the most urgent terms to return. Sale refused to do so, and the justifiability of his refusal formed for twenty years afterwards the subject of burning controversy in English military circles. It was said by the garrison at Cabul that had he done so he would have extricated them from all their troubles, and have restored peace and order. It was said further that had he even remained at Gundamuck he would have kept the Khoord-Cabul and Jugdulluck Passes open, and have thus enabled the Cabul force to retreat in safety. He, however, neither went to Cabul nor remained in Gundamuck, and the reasons he gave were that he had neither ammunition nor provisions to enable him to reach Cabul or be of any use after he got there, as he would have had to fight his way; and if he remained at Gundamuck the enemy would seize Jalalabad, and thus bar the road to Peshawar, which, in that case, he would reach, if at all, after a disastrous retreat. He decided, therefore, and he was a man who shrunk from all responsibility and preferred, when he could, to confine himself to obeying orders, to retreat on Jalalabad and hold it, and thus help to keep the road to India open to the Cabul force in case it found itself obliged to retire. He only came to this decision after full consultation with his officers, two of whom—Dennie and Broadfoot—were already famous Indian soldiers, and on his staff was Havelock, then a plain captain, afterwards the illustrious general who relieved Lucknow in the Mutiny, but whose counsels even in those early days had a weight with his seniors to which neither his age nor experience entitled them, so clear was his head and so bold his heart. Over Sale his influence was supreme.

On the 12th of November, 1841, ten days after the rising at Cabul, Sale accordingly evacuated Gundamuck and marched for Jalalabad, leaving behind him most of his baggage, feeling satisfied that he would have enough to do in taking care of his three hundred sick and wounded. He had no sooner left the place than his stores were plundered and his cantonments burnt, and the country rose behind him. The mountain tribes thought he would be an easy prey, and that he was making the best of his way back to India, which they determined he should never reach. They accordingly swarmed on the hill-sides on the line of march, keeping up a galling fire from their jezails, or long guns, which carried full two hundred yards further than the old smooth-bore musket of the English service, which was still the same, barring the flint-lock, with which the battles of the Peninsula war had been fought. But in the first few miles they found that they were not dealing with fugitives, but with soldiers who were more than their match even in their own style of warfare. Flanking parties drove them with slaughter from their rocky heights, and their charges on the train were repelled with a fire which at close quarters was always murderous. Finally, all stomach for fighting was taken out of them by a manœuvre of Dennie's, who, by a feigned retreat of the infantry, drew them down on an open plain in a disorderly and exultant mass, in supposed pursuit of a flying enemy, and then launched his cavalry on them in a furious charge, in which they were sabred until the troopers were weary of striking. On the following morning the force reached Jalalabad, the inhabitants of which looked on it as making all haste for Peshawar, and did not in the least expect it to occupy the town, and fled in a panic when it entered. By noon it was in full possession of the place.

The prospect, however, was a sorry one. There was a circuit of what had once been a rampart, but it was a mile and a half long, and was at no single point in a defensible condition. In many places it was barely traceable, in others so low that carts passed over it; in some it was high on the inside and presented an easy slope on the other. Houses and gardens abutted on it all round, and outside it was commanded in every direction by ruined mosques and forts and buildings of every description, from which fire could be opened at a distance of thirty yards. To put it in even decent repair seemed work enough for two months for ten thousand men, and it would apparently have needed twenty thousand men to man it effectually. Sale had not more than two thousand five hundred men all told; few or no tools; only two days' provisions, and a scanty supply of ammunition. After a few hours' debate as to whether he should attempt to hold the town or retire into the citadel, for which he had force enough, it was resolved to stay in the town at all hazards, if for no other reason, for the sake of the moral effect. The houses and gardens outside were so strongly occupied by the enemy that during the first night the troops were unable to stay at their posts. The next day everybody went to work. Wood and iron were obtained by pulling down old houses; spades and pickaxes were collected, and the process of clearing out the ditch began. Within three days, however, a large force of the enemy, estimated at five thousand, had collected outside, hurling threats and defiance, and keeping up a desultory fire, which compelled the garrison on the 16th to take decided measures with them. Eleven hundred men of all arms suddenly dashed out and fell upon them, and they fled panic-stricken, suffering heavily from the cavalry in the pursuit. After this there were two weeks of quiet, during which provisions were collected in considerable quantities and good progress made with the fortifications. By the 1st of December the enemy had collected again, and another sortie was made on them, this time by Dennie, who defeated them again with great slaughter without the loss of a single man. By the middle of December the place was in a reasonable state of defence, and the garrison were in good health and high spirits. But rumors began to come that things were not going well down in Cabul, though neither officers nor men could bring themselves to believe that such a force as Elphinstone had would find real difficulty in dealing with the undisciplined hordes whom they scattered so easily at Jalalabad. Sale and Havelock knew the whole dismal truth, but they kept it to themselves. At last, however, the news got out that the British had capitulated; then in quick succession came the startling report that MacNaghten had been murdered and that the whole force was going to try to retreat on Jalalabad, with the expectation of being attacked on the way. Then came an order to evacuate Jalalabad signed by MacNaghten's successor, Pottinger, and by General Elphinstone, which Sale submitted in consternation to a council of the officers and decided to disobey. Dennie now predicted that the garrison of Cabul would be destroyed, and that only one man would survive to bring the news. The work on the fortifications was continued under the most sickening suspense, and by the middle of January the place was fairly enclosed. On the morning of the 15th the garrison were still toiling away with axe and shovel, their arms piled close by, when the sentinel reported a solitary white-faced horseman as coming slowly across the plain from the entrance of the pass on the Cabul side. A great fear fell on all. Tools were laid down, glasses produced, and the rampart crowded with anxious spectators of his tottering progress. For it was soon seen that he was wounded by the way he leaned on his pony's neck, and it was soon seen, too, that the pony itself was on its last legs, and it seemed doubtful whether it could carry him to the gate. The silence was broken by Colonel Dennie's calling out: "Did I not say so; here comes the messenger!" A party of cavalry were sent out to help in the fugitive. It was Dr. Brydon, and he told the horror-stricken crowd in a faint voice that he believed he was the sole survivor of the Cabul force. The first shock of surprise over, patrols were sent out to scour the neighborhood in the hope of picking up other fugitives, and all through the night the bugles were loudly blown on the ramparts as a signal that refuge was near; but no more came in. The few who had escaped massacre were prisoners.

Having done what they could for their unhappy comrades, the Jalalabad garrison returned anxiously to the work of providing for their own safety, for it was plain that the enemy would soon be down on them in great force and flushed with victory. When they would be relieved they did not know. One attempt to rescue them by a small force under General Wild had failed in the Khybar Pass, and Akhbar Khan, they heard, was organizing an army thirty miles away to assail them. Foraging for provisions was carried on in the neighborhood more actively than ever. Two hundred Afghans who formed part of the garrison were dismissed through fear of treachery. An order from old Shah Soojah, who was still nominally reigning at Cabul, though in the hands of the Afghan chiefs, to evacuate the place was disregarded, and the finishing touches were given to the fortifications. On the 18th of February Akhbar Khan was reported to be near at hand, but the town was surrounded by a ditch ten feet deep and twelve feet wide, and by a parapet seven feet high. The forts and old walls and gardens had been cleared away on the out-

side, the ravines filled and the groves cut down, and the gates covered by outworks. On the 19th there was a sound as of thunder; the earth shook, the houses rocked, and in a few seconds a third of the town was in ruins; the parapet and several of the bastions were destroyed, and the Cabul gate was a mass of débris. An earthquake had destroyed a large part of the labor of three months. The shocks had hardly ceased when the working parties began again, and by the end of ten days had repaired the worst of the damage.

Akhbar Khan was all this time but a few miles away; but he had resolved not to besiege, but to blockade. So he gradually drew his circle closer about the place, drove in the foraging parties, and prevented the entrance of supplies from the country around. Some of the officers had thought of the horrid possibility that he might, barbarian as he was, try to terrify Sale into surrender by bringing up Lady Sale and her daughters, and threatening them under his eyes; and some one finally ventured to prepare him for it by mentioning it. The old man's frame, it is said, shook with emotion, and he muttered that if he did "he would open on them with every gun in the place." On the 11th of March Sale made a sortie, but could not bring on an engagement, and the remainder of the month passed quietly, but with increasing scarcity of provisions, ammunition, and forage. Matters were rapidly reaching a crisis, and there was no positive news about the relieving force which was being organized at Peshawar under General Pollock. On the 1st of April Sale made another sortie and captured 500 sheep and goats, which assured him of meat for ten days. On the 5th came a rumor that Pollock had been defeated with great slaughter in an attempt to force the Khybar, and Akhbar Khan's guns fired a salute in honor of the alleged victory. Sale felt that, whether the news were true or false, the time had come to strike a decisive blow. Accordingly, on the 6th of April, he marched out with 860 men of his infantry in three little columns, one commanded by Havelock, one light field battery, and a small force of cavalry. The sortie was made at daybreak, and Akhbar Khan was found ready for them, his force of 6,000 strong being drawn up with his right on the river and his left on a fort. The plan of attack was Havelock's, and a slight departure from it at the outset came near entailing disastrous results; but the mistake was perceived and retrieved in time, though at the cost of Dennie's life. It was very simple and proved completely effective. The artillery advanced at a gallop on the Afghan centre and opened on it at close range, two columns of the infantry marching straight for the same point, while the other forced his left into the river. In an hour the enemy was driven from his position in wild confusion, leaving his guns, camp, and stores in the hands of the British, whose loss was only eight men killed and fifty-three wounded. Two or three days later General Pollock's army, which had forced the Khybar Pass without serious difficulty, came marching in. The band of one of the regiments of the garrison went out some miles to meet them, and played them in to the tune, "Oh! but ye've been lang o' comin'."

There was some further fighting in the advance on the Candahar line under General Nott, but Pollock marched on in a leisurely way to Cabul without further resistance, to find the city half deserted by the inhabitants. He hoisted the British flag on the Bala Hissar and saluted it with imposing ceremonies, and by way of leaving behind an ineffaceable mark of British vengeance blew up the great stone bazaar. The old king, Shah Soojah, had by this time been assassinated by the Afghans, and his son, Futteh Jung, was afraid to reign in his stead, and begged to be taken back to India. Akhbar Khan sent in to sue for peace; the English ladies and children who had been wandering about in the Hindoo Koosh, suffering indescribable hardships and anxiety, were carried into camp by the commander of their guard, whom they had succeeded in bribing. Poor old General Elphinstone had died while with them, broken-hearted by his misfortunes, and lies buried side by side with Dennie by one of the bastions which Sale built and so well defended at Jalalabad. Then the country was evacuated by the troops in easy marches, and Dost Mohamed allowed to resume the throne without molestation. Everything seemed to go back to the *status quo*, but the war had cost thirty thousand dead and $75,000,000. The story long continued to be told with horror, not in English homes only, but all over Europe. Several journals were published by surviving officers, one most interesting one by Lady Sale, which had an immense circulation. Brave old Sale was killed at Moodkee, in the Sikh war, four years later. Havelock lived to fulfil the promise of his splendid prime, in the mutiny of 1857, when, after forty years of brilliant service, he first obtained the command of an army in the field. General Pollock died full of years and honor in 1872, and Dr. Brydon, the survivor of the retreat, only last year.

THE NEW YEAR IN ENGLAND.

London, January 7, 1879.

IT will hardly be pretended this year that the English Christmas has been a merry one, or that the New Year has the promise of being particularly happy. The winter is proving very cold and vicious—as if Nature herself were loath to be left out of the general conspiracy against the comfort and self-complacency of man. The country at large has a sense of embarrassment and depression, which is brought home more or less to every class in the closely-graduated social hierarchy, and the light of Christmas firesides has by no means dispelled the gloom. Not that I mean to overdo the gloom. It is difficult to imagine any combination of adverse circumstances powerful enough to infringe very sensibly upon the appearance of activity and prosperity, social stability and luxury, which English life must always present to a stranger. Nevertheless, the times are distinctly hard—there is plenty of evidence of it—and the public spirits are not high. The depression of business is extreme and universal; I am ignorant whether it has reached so calamitous a point as that almost hopeless prostration of every industry which you have lately witnessed in America, and I believe things are by no means so bad as they have been on two or three occasions within the present century. The possibility of distress among the lower classes has been minimized by the gigantic poor-relief system which is so characteristic a feature of English civilization, and which on particular occasions is supplemented (as is the case at present) by private charity proportionately huge. I notice, too, that in some parts of the country discriminating groups of work-people have selected these dismal days as a happy time for striking. When the laboring classes are able to indulge in the luxury of a strike I suppose the situation may be said to have its cheerful side. There is, however, great distress in the North, and there is a general feeling of impecuniosity throughout the country. The *Daily News* has sent a correspondent to the great industrial regions, and almost every morning for the last three weeks a very cleverly-executed picture of the misery of certain parts of Yorkshire and Lancashire has been served up with the matutinal tea and toast. The work is a good one and, I take it, eminently worth doing, as it appears to have had a visible effect upon the purse-strings of the well-to-do. There is nothing more striking in England than the success with which an "appeal" is always made. Whatever the season or whatever the cause, there always appears to be enough money and enough benevolence in the country to respond to it in sufficient measure—a remarkable fact when one remembers that there is never a moment of the year when the custom of "appealing" intermits. Equally striking, perhaps, is the perfection to which the science of distributing charity has been raised—the way it has been studied and elaborated and made indeed a science. One perceives that it has occupied for a long time a foremost place among administrative questions, and has received all the light which immense experience and practice could throw upon it. The journal I quoted just now may perhaps, without reproach, be credited with a political *arrière-pensée*. It would obviously like its readers to supply in this matter of the stagnation of trade the missing link between effect and cause—or the link which, if not absolutely missing, is at any rate difficult to lay one's hand upon. The majority in Parliament were not apparently of the opinion that the disorganization of business is the fault of Lord Beaconsfield; but there is no doubt that it is a misfortune for the Conservative party that this bad state of things coincides very much with its tenure of office. When an Administration may be invidiously described as "restless," "reckless," and "adventurous," and when at the same time business is very bad and distress increasing, it requires no great ingenuity to represent the former fact as responsible for the latter.

I have spoken of the rigor of the time in the lower walks of English life; and it is not out of place to say that among those happier people who stand above the reach of material incommodity, the Christmas season has been overshadowed, sentimentally—or, at least, conventionally—by the death of Princess Alice. If I had written to you at the moment this event occurred I should have been tempted to make some general reflections upon it, and it is even now perhaps not too late to say that there was, to an observer, something very interesting and characteristic in the manner in which the news was received. Roughly speaking, it produced much more commotion than I should have expected: the papers overflowed with articles on the subject, the virtues of the deceased lady and the grief of the Queen were elaborately commemorated; many shops, on the day of the Princess's funeral, were partially closed, and the whole nation, it may be said—or the whole of what professes in any degree

whatever to be "society"—went into mourning. There was enough in all this to make a stranger consider and interrogate; and the result of his reflections would, I think, have been, that, after all statements are made, the monarchy has still a great hold upon the affections of the people. The people takes great comfort in its royal family. The love of social greatness is extraordinarily strong in England, and the royal family appeals very conveniently to this sentiment. People in the immense obscurity of that middle-class which constitutes the bulk of the English world like to feel that they are related in some degree to something that is socially great. They cannot pretend that they are related to dukes and earls and people of that sort; but they are able to cultivate a certain sense of being related to the royal family. They may talk of "our" princes and princesses—and the most exalted members of the peerage may do no more than that; they may possess photographs of the Queen's children, and read of their daily comings and goings, with an agreeable sense of property, and without incurring that reproach of snobbishness which sometimes attaches to too eager an interest in the doings of the great nobility. There is no reason to suppose that the Queen takes the humorous view of this situation; her Majesty is indeed credited with a comfortable, motherly confidence in the salutary effect of the court-circles upon the mind of the middle-class; and there is a kind of general feeling that, socially speaking, the Queen and the middle-class understand each other. There was something natural, therefore, in the great impression made by the death of a princess who was personally known but to an incalculably small proportion of the people who mourned for her, and on whose behalf propriety would have resented the idea that she could be personally missed. It is nevertheless true that Lord Beaconsfield is felt to have overdone his part very egregiously, in announcing the event to the House of Lords in language in which he might have proclaimed some great national catastrophe. I was told by a person who was present that the House felt itself to be completely at the mercy of his bad taste—that men looked at each other with a blush and a kind of shudder, and asked each other what was coming next. He remarked, among other things, that the manner in which the Princess Alice had contracted her fatal illness (her tender imprudence in kissing her sick children) was an act worthy to be commemorated in art—"in painting, in sculpture, and *in gems*." I have heard these two last words wittily quoted in illustration of his Semitic origin. An ordinarily florid speaker would have contented himself with saying "in painting and in sculpture." The addition "in gems" betrays the genius of the race which supplies the world with pawnbrokers.

I left town a short time before Christmas and went to spend the festive season in the North, in a part of the country with which I was unacquainted. It was quite possible to absent one's self from London without a sense of sacrifice, for the charms of the metropolis during the last several weeks have been obscured by peculiarly atrocious weather. It is, of course, a very old story that London is foggy, and this simple statement is not of necessity alarming. But there are fogs and fogs, and these murky visitations, during the present winter, have been of the least tolerable sort. The fog that draws down and absorbs the smoke of the housetops, causes it to hang about the streets in impenetrable density, forces it into one's eyes and down one's throat, so that one is half-blinded and quite sickened—this atmospheric abomination has been much more frequent than usual. Just before Christmas, too, there was a heavy snow-storm, and even a tolerably light fall of snow has London quite at its mercy. The emblem of purity is almost immediately converted into a sticky, lead-colored mush, the cabs skulk out of sight or take up their stations before the lurid windows of a public-house, which glares through the sleety darkness at the desperate wayfarer with an air of vulgar bravado. This state of things in the London streets made a rather sorry Christmas, though I believe the Christmas hearth is supposed to burn the more brightly in proportion as the outer world is less attractive. The wonderful London shops were, of course, duly transfigured, but they seemed to me, for the most part, to have an aspect of vain expectation, and I hear that their proprietors give a melancholy account of the profits of the season. It was only at a certain charming little French establishment in Bond Street that I observed any great activity—a little chocolate shop where light-fingered young women from Paris dispense the most wonderful bonbonnières.

To keep one's self in good humor with English civilization, however, one must do what I alluded to just now—one must go into the country; one must limit one's horizon, for the time, to the spacious walls of one of those admirable homes which at this season overflow with hospitality and good cheer. By this means the result is triumphantly attained—these are conditions that you cordially appreciate. Of all the great things that the English have invented and made a part of the glory of the national character, the most perfect, the most characteristic, the one they have mastered most completely in all its details, so that it has become a compendious illustration of their social genius and their manners, is the well-appointed, well-administered, well-filled country-house. The grateful stranger makes these reflections—and others besides—as he wanders about in the beautiful library of such a dwelling of an inclement winter afternoon just at the hour when five-o'clock tea is impending. Such a place and such a time abound in agreeable episodes; but I suspect that the episode from which, a fortnight ago, I received the most ineffaceable impression was but indirectly connected with the charms of a luxurious fireside. The country I speak of was a populous manufacturing region, full of tall chimneys and afflicted with a carboniferous atmosphere. A lady had made a present of a Christmas-tree to the children of a workhouse, and she invited me to go with her and assist at the distribution of the toys. There was a drive through the early dusk of a very cold Christmas Eve, followed by the drawing-up of a lamp-lit brougham in the snowy quadrangle of a grim-looking charitable institution. I had never been in an English workhouse before, and this one transported me, with the aid of memory, to the early pages of 'Oliver Twist.' We passed through certain cold, bleak passages, to which an odor of suet-pudding, the aroma of Christmas cheer, failed to impart an air of hospitality; and then, after waiting a while in a little parlor appertaining to the superintendent, where the remainder of a dinner of by no means eleemosynary simplicity and the attitude of a gentleman asleep with a flushed face on the sofa seemed to effect a tacit exchange of references, we were ushered into a large, frigid refectory, chiefly illumined by the twinkling tapers of the Christmas-tree. Here there entered to us some hundred and fifty little children of charity, who had been making a copious dinner, and who brought with them an atmosphere of hunger memorably satisfied—together with other traces of the occasion upon their pinafores and their small red faces. I have said that the place reminded me of 'Oliver Twist,' and I glanced through this little herd for an infant figure that should look as if it were cut out for romantic adventures. But they were all very prosaic little mortals. They were made of very common clay indeed, and a certain number of them were idiotic. They filed up and received their little offerings, and then they compressed themselves into a tight infantine bunch, and, lifting up their small, hoarse voices, directed a melancholy hymn toward their benefactress. The scene was a picture I shall not forget, with its curious mixture of poetry and sordid prose—the dying wintry light in the big, bare, stale room; the beautiful Lady Bountiful, standing in the twinkling glory of the Christmas-tree; the little multitude of staring and wondering, yet perfectly expressionless, faces.

'LES MIRABEAU.'—II.

PARIS, December 22, 1878.

I HAVE always felt, I must confess, a great partiality for the father of Mirabeau, the Marquis, commonly called "L'Ami des hommes." It was founded merely upon the study of his book, which I found many years ago in a box on the Quai Voltaire. This work, now so well forgotten, seemed to me written in a strange, often pathetic, always vigorous style. The author appeared to me to be a sort of rural Saint-Simon, an aristocrat of the farm, not of the court—one of those types of country gentlemen which are common even now in England, men who are really of the people, among the people, and for the people, and imbued at the same time with the most delicate traditions of honor and of ancestral pride. I cannot imagine anything more eloquent than some passages of the treatise on 'Population,' which made the reputation of the Marquis, nor a more pungent, original style, especially when you remember that the book was written in the middle of the eighteenth century, when the literary world was under the mild, commonplace, conventional influence of the literary school of Dorat, of St.-Lambert, of Crébillon (the son). Society was in a sort of fool's paradise. Philosophy itself, in order to spread its new creed, was obliged to conceal its teaching in licentious verses, in novels, in epigrams. Mirabeau was the eloquent advocate of agriculture at a time when the nobility abandoned its estates and lived at court. He is considered as the disciple of the famous Doctor Quesnay, the chief of the school of economists who called themselves *physiocrats*. But he was not only his disciple. He published his famous work on 'Population' in 1756, many years before Quesnay (who was Madame de Pompadour's physician) had become widely known. As soon, however,

as the Marquis de Mirabeau knew Quesnay, and had become acquainted with his ideas, he renounced voluntarily all claims to originality and gave himself out as the apostle of his friend. Mirabeau's notoriety is anterior to that of Quesnay, and Quesnay owed much to Mirabeau, who was the first to proclaim the merits of the author of the 'Tableau Économique.'

Victor Riqueti, Marquis de Mirabeau, called "L'Ami des hommes," was born the 4th of October, 1715, at Pertuis, not far from the ancestral seat of his family. He was educated in the most rigid manner by his father, who was convinced (like the father of Chateaubriand) that all demonstration of sensibility or familiarity ought to be banished between parents and children. Chateaubriand tells us in the most graphic manner, in his 'Mémoires d'outre Tombe,' what his youth was in the Château de Combourg. Such was the youth of the young Mirabeau. He was sent to the Jesuits for a short time, and then to the army.

"My father sent me away very suddenly," he says, "at the end of 1729 [he was consequently only fourteen years old]. Until the carriage arrived he made me read a book; when he heard the carriage he stopped me. 'There,' said he, 'is your carriage; good-by, my son; be wise, if you wish to be happy.' And I went out as I should have done any other day."

In 1731 the young soldier was placed in a military academy in Paris. He was of a brutal disposition, like all the Mirabeaus, and himself tells how, after "astonishing excesses" and a grave malady, he "threw himself out of this train of debauchery into which his vanity more than his taste had thrown him." He continued, however, to spend his evenings at the theatre, where he made much noise, after the fashion of the time; so much so that he was known as "le chevalier tapageur." He fell in love with a young actress, who became famous under the name of Dangeville. His father sent him to a regiment in Besançon to cure him of his folly. At the age of eighteen he took part in the campaign of 1734, which gave Lorraine to France. After the war he returned to Paris, where he made the acquaintance of Vauvenargues, who was not yet known. Vauvenargues was an officer, like himself, who had renounced at the age of twenty-eight the military career, on account of his bad health. He tried, without success, to enter into the diplomatic career, and only published in 1746, a year before his death, the book which made his name immortal, and will always give him a place close by our glorious moralists, Montaigne, Larochefoucauld, Labruyère, and Pascal. Mirabeau loved Vauvenargues and understood his genius. The correspondence of these two men is one of the most interesting chapters of the work of M. de Loménie.

When Mirabeau's father died he was left with a fortune of 27,500 francs, out of which he had to pay 11,500 francs to his mother and his two brothers. With the difference, 16,000 francs, he was at that time considered rich. He had a good name; he married Mlle. de Vassan, the daughter of a president at the Cour des Comptes of Paris. He did not know her; he had never seen her when he made his offer; he did not know his mother-in-law; the dower was not a capital, but an annuity hardly sufficient for the expenses of his wife. M. de Vassan was rich, and the young Mirabeau married his fortune in imagination. He was ambitious of fortune, and desired to make of "a house of Provence" a "house of France." Mirabeau wrote afterwards in one of his letters to his brother, the Bailiff: "The twenty years during which I lived with my wife were twenty years of nephritic colic." The expression is rather strong. The two characters were quite incompatible; still, they lived together during twenty years. Mirabeau was possessed with a feverish activity. His domestic quarrels were not enough for him, nor his continuous speculations in land, in houses (he contrived to ruin himself completely in the end); he was utopian in the management of his personal affairs; he became utopian in state matters. "I was," he declared, "no more an economist than a cat when the strength of my temper made me write 'L'Ami des hommes.'"

I will give here the summary of the chapters of this book as I find it in the original edition, vol. i.:

"Society and wealth—The measure of subsistence is the measure of population—Agriculture, which alone multiplies the means of subsistence, is the first of arts—Advantages of France with regard to agriculture—What makes agriculture languish—Of the necessity and the means of encouraging agriculture—The uses of the land depend on the usages of men—Work and money."

In the second volume the chapters run thus:

"What foreign commerce is; its necessity; on what plan it ought to be conducted—Communications and ports—The military navy, how it can become flourishing; how it ought to be limited—Prohibitions—Colonies—Peace and war—Résumé of the whole work."

The résumé itself concludes with these short sentences:

"True wealth consists *only* in population; population depends upon subsistence; subsistence is only drawn from the earth; the product of the soil depends on agriculture; therefore all other means—commerce, gold, the arts and sciences—serve to establish a decided and independent prosperity only on condition that they vivify, encourage, and enlighten agriculture, the first, the most useful, the most innocent, and the most precious of arts."

You see at once how much these ideas are at variance with the present school of political economy, which is founded upon the notion of credit, of exchange, of circulation, of ideal values. The style of the 'Ami des hommes' is at times very striking. The friend of humanity attacks with violence the great landlords who live in Paris and have abandoned their impoverished estates. He has passages against those who prefer money, wealth, municipal luxury to land, worthy of the greatest writers. He is in favor of a strong social hierarchy; he considers religion as the greatest force of a well-organized state; he does not approve of debts—of the debts of the state any more than of others; he goes for absolute liberty of trade within and without the frontiers; he is a free-trader before free-trade is invented. His political code is embodied in five maxims: 1st, love and honor agriculture; 2d, throw back from the centre to the extremities what you draw now from the extremities to the centre; 3d, despise luxury and exaggeration of expense; 4th, honor virtue and talent, and don't pay them; 5th, lower the rate of interest and pay the debts of the state. When he says curtly that virtue and talent ought not to be paid, he means that money ought not to be a standard of consideration: "As soon as a profession is valued only by its salary, the soldier who receives five sous a day will be less than a lackey, and the officer less than a groom."

I must cite here what I consider one of the finest passages of Mirabeau, in favor of the poor gentry:

"The style of life of our old gentry, who drank too much, slept on old chairs or mattresses, rode and hunted early—that sort of life made few musicians, fewer geometers, poets and court-actors; but there was no need of the nobility for that. This nobility, leading a gay and hard life, cost the state very little, and produced more by its residence and its manure on the nourishing mother earth than we can give it now by our taste, our fancies, our colics, and our vapors. They knew nothing in comparison with us; for we know the rules of the theatre, the differences between the French and the Italian music; we judge the geometers; we make lectures on anatomy and botany; we understand carriages, varnish, snuff-boxes, porcelain; we are not ignorant of the art of lying, nor of intrigue, nor of business, nor of the art of begging, nor of red heels, nor what is the worth of our neighbor's money. They put all their wisdom in seven or eight articles: to respect religion, never to lie, to keep a word given, to do nothing mean, to suffer no insult, to keep a horse to the right foot (*mettre un cheval sur le bon pied*), to know the scent, to fear neither hunger nor thirst, neither heat nor cold. These people, however, were not incapable at times of helping the state; they had even rather fine ideas on true glory, prejudices which our philosophy has replaced by calculations more useful for the individual than for the public. Take, for instance, Henri IV., who was brought up and lived, till he became grey, as a true country gentleman; well, Henri IV. did his work of king about as well as another."

Is not this very savory and refreshing? How many passages like this I might cite! The theories of "land against money" or "money against land" will be forgotten when such pages will still be read with much pleasure.

I will not enter into the laborious account of the quarrels of Mirabeau, the father, with all his family, with his wife, with his terrible son. His life was a titanic life, full of effort, of struggles without glory, of miserable and deplorable mistakes. He fell like a Titan; he was overworked, overstrained; his only consolation was the affection of his good brother. He died having hardly witnessed the glory of his son, who had never been to him but an enemy. The relations of these two men, who had something monstrous in their natures, is a very curious study for the moralist; but it is so painful that I must refer my readers to the work of De Loménie.

Correspondence.

"COURT CIRCLES" AND GOOD NEIGHBORHOOD.

To the Editor of The Nation:

Sir: In your paragraph on my letter to the Manchester *Examiner* you somewhat mistake my meaning. Perhaps I did not express it clearly.

I do not imagine that the mere establishment of a court at Ottawa is likely to embroil Canada with the United States. But I think that if, by

the influence of that court and other influences of the same kind, Canada is made the seat of a social sentiment strongly antagonistic to the democracy of the United States, trouble to the inhabitants of this continent may ultimately be the result, just as trouble resulted from the social antagonism created by slavery between the Northern and the Southern States.

The existence of anti-republican or non-republican elements among your people is the very thing that constitutes the danger. It is in the hope that your account of the state of sentiment among Americans is true that British Toryism, now flushed with victory, makes this first attempt to propagate monarchy and aristocracy in the New World. I suppose, however, in spite of your somewhat ominous words—ominous because political institutions do not long survive social sentiments—that a large portion of your people are still true to democracy; and if so, with them an embroilment and a struggle may eventually take place.

Yours faithfully, GOLDWIN SMITH.

TORONTO, Jan. 13, 1879.

ENCROACHING ON THE FEDERAL JUDICIARY.

TO THE EDITOR OF THE NATION:

SIR: In your article on the "Federal Judiciary" of the 2d inst. you have erroneously confounded the nature and purpose of a bill introduced in the House by myself with one which Senator Garland, of Arkansas, has presented in the Senate. By examination it will be seen that the purpose of my bill is to repeal the law authorizing *removal of causes from State courts into Federal courts*, and does not in any degree whatever prevent or interfere with the right to sue in the Federal courts, or with the privilege of bringing suits in the United States by any parties now entitled by law to do so, against cities, towns, counties, or individuals. Without expressing any opinion here of Senator Garland's bill or of your criticism upon it, I desire to call your attention to the distinction between the two bills, and to the fact that your observations are inapplicable to the bill I have introduced.

My high opinion of the usual fairness with which questions are discussed in your very ably-conducted journal, convinces me that you have not intended to improperly characterize this measure. I beg leave to present you with the enclosed copy of my remarks in the House, embracing the bill to which I refer. Should you feel further interest in this subject, you may from these remarks understand the reasons which have influenced my action.

Very respectfully, etc.,

R. W. TOWNSHEND.

HOUSE OF REPRESENTATIVES, WASHINGTON, D. C., Jan. 6, 1879.

[Our language of which complaint is made was, "And here it is well enough to observe that Congressman Townshend, of Illinois, has introduced a bill in the House *quite similar* to that of Senator Garland."

A careful examination of the bills of Messrs. Garland and Townshend shows that, while the former seeks to divest the United States courts of their primary jurisdiction over cities, towns, villages, counties, and other municipal or public corporations, at the suits of non-residents; and also over one important class of cases (to which foreign insurance companies are parties defendant) now removable from the State courts, the latter, as stated by its author, aims to deprive them of all business now transferable from State courts. There is a difference, but it is a difference of degree rather than of principle or policy. In their general tendency the two measures would seem to be not only "quite similar," but identical. Indeed, so accordant are they in spirit and motive that lawyers would say they "run together on all fours." Both seek to diminish in material and, in part, identical points the jurisdiction and authority of the Federal courts.

The right to transfer from State to Federal courts causes to which citizens of different States are parties was conferred by Congress as far back as 1789, and has existed ever since. It was legislatively bestowed almost immediately on the adoption of the Constitution, because it was understood to be one of those contemplated in that instrument, which expressly provides, in defining the authority of the Federal judiciary (section ii., article iii.), that "the judicial power shall extend," among other cases mentioned, to controversies "between citizens of different States." The reason for the provision is clear enough. Realizing that State tribunals were liable to be largely under the control of local influences and interests, as has often proved to be the case, especially when municipal and other corporations were parties to suits, the Constitution aimed to give parties litigant, no matter where residing, an opportunity for impartial justice, by opening to them the doors of courts to which they were equally related. But if Mr. Townshend's bill were to become a law, a citizen of New York who might come under the jurisdiction of a local court of Illinois, either by being temporarily there in person or by having property within it, would be compelled to abide by that court's decision at the suit of an Illinois citizen, the Constitution of the United States to the contrary notwithstanding.

But what gives the bills of Messrs. Garland and Townshend their principal interest is, not the shades of difference between them, whether more or less distinct, but the fact that both represent a movement to cripple, if not degrade, the Federal courts, at a time when its success would involve the loss of many millions of money, as well as important principles of inter-sectional policy. It so happens that at this time the financial interests of leading portions of the country—many of them already subjects of legal controversy, or likely to become such—are not in accord. The East, having measurably completed its local public improvements, has had a surplus of capital to invest. The West, having its railroads to build and its lands to open up and improve, with comparatively little wealth of its own, has been under the necessity of borrowing largely. The result is that the West now finds itself heavily indebted to the East, its liabilities being represented to a very considerable extent by mortgages upon its farms, and by municipal securities that are liens upon the taxable resources of its cities, counties, and towns. To enforce these liabilities it has in many instances, in consequence of attempted repudiation, been necessary to have recourse to the courts. In the proceedings thus instituted the local opposition has often been so strong and bitter that the local courts have been unable to withstand it. Under such circumstances the Federal courts, in consequence of occupying a more independent position, have been called upon to assume jurisdiction. To take from them the powers they now exercise in this regard, as is to a greater or less degree the purpose of both the bills referred to, it is not too much to say would amount to a practical cancellation of a very large portion—possibly the larger portion—of the indebtedness of the West to the East, because, while the legal liability might remain, it would be non-enforcible. That is the whole story.—ED. NATION.]

"THE BANKER'S DAUGHTER."

TO THE EDITOR OF THE NATION:

SIR: I have just had my attention drawn to what seems to me a gratuitous insult, in a recent number of your paper. Your dramatic critic has thrown out a wanton insinuation that I have been guilty of literary theft, without offering the slightest evidence of the fact, or naming the French play from which, as he intimates, my own play, "The Banker's Daughter," has been drawn. In 1874 the London *Times* made a similarly vague suggestion concerning the play of "Saratoga." I wrote to the editor denying the implied charge, and saying that so serious an accusation should, in common justice, leaving courtesy out of the question, be accompanied by the name of the play from which mine had been stolen, with a specific account of the resemblances; and until that could be done the slightest insinuation of such an offence should be withheld. The *Times* published my letter accompanied by an editorial apology. I wish to enter a formal and absolute denial of your critic's charge; and I am confident of receiving as ample justice from an American publication as I did from an English journal. The crime of dramatic robbery has become a very common one, in both England and America; but I do not think our familiarity with it justifies any one in treating it as a trifling matter, by accusing another of it lightly and without definite proof.

Very respectfully yours, BRONSON HOWARD.

DETROIT, January 11, 1879.

[We did not accuse Mr. Howard of "literary theft," because we expressly stated that a controversy was raging between him and

several unknown writers as to the authorship of the play in question. This fact being notorious, we simply remarked: "The 'Banker's Daughter' is a trifle more American than most plays of its class, yet if it does not turn out, *at some remove*, to have a French origin, we shall be greatly surprised."—Ed. Nation.]

Notes.

We regret to record the sudden death on Monday of Mr. J. Blair Scribner, head of the house of Charles Scribner's Sons and the allied firms. Mr. Scribner was the oldest son of the late Charles Scribner, and only twenty-eight years of age. We are sure that we do but echo the sentiment of the community when we express the hope that this sad event will not seriously affect the great publishing house which had descended to the second generation under such favorable auspices. ——Lee & Shepard are about to issue 'Midnight Marches through Persia,' by Henry Ballantine; and 'Spiritual Manifestations,' by the Rev. Charles Beecher.——Houghton, Osgood & Co. send us volumes three and four of the *American Architect*, bound in one, and presenting a very handsome appearance. This excellent periodical leaves nothing to be desired on the part of its conductors, but one might wish the profession to take a more lively interest in it, at least as contributors.——The Messrs. Rivington, London, send us the volume for 1878 of their illustrated quarterly called the *Church Builder*, devoted to church extension in England and Wales, in connection with the Church Building Society. Besides the accounts of new churches built in whole or in part by the Society, it contains interesting papers on kindred subjects. One reads with interest the remarks of Mr. Armitage on Mural Painting, delivered before a general conference of architects held by the British Institute of Architects, together with the substance of a debate which followed. There are essays on the Palestine Survey Expedition and on the site of the Holy Sepulchre, and a long discussion of church restoration, all of which are good reading. The *Church Builder* may, therefore, be looked upon as a journal, in little, of art and archæology, not without its value for the student and the general reader.——Apropos of church-building, we observe in the London *Times* a protest by Mr. T. Wemyss Reid against the proposed destruction of Haworth Church, in which Charlotte and Emily Brontë lie buried, in order to make way for a more commodious and convenient structure, to suit the present rector's ideas.——The issue of the *Art Interchange* for January 8 has been made the beginning of a new volume. The journal has been enlarged in size, and its departments reduced in number—a double advantage. Its special correspondence of art news, and its notes and queries, are perhaps its most valuable features. Announcement is made of the condition of the select Lending Library of the Society of Decorative Art, and of the very liberal terms on which books may be borrowed and returned by mail. The more costly and bulky works can naturally only be consulted at the Society's rooms, No. 34 East Nineteenth Street.——Macmillan & Co. have issued Part V. of Dr. Grove's 'Dictionary of Music and Musicians.' It includes among composers Fétis, John Field, Flotow, Robert Franz, Gade, Gluck, Gounod, Grétry, and even Franklin (on account of the "musical glasses") and Frederic the Great, "a distinguished amateur"; among singers and performers, J. B. Faure, Karl Formes, the Garcias, Arabella Goddard, and Grisi; among instruments, the flageolet, flute, French horn, grand piano, guitar; among famous songs and operas, "Charmante Gabrielle," "Greensleeves," "God Save the King," "Fidelio," and "Götterdämmerung." The most elaborate technical article is on Form. Under *Grand Prix de Rome* there is a complete list of the grand prizes awarded for music by the Académie des Beaux-Arts, 1803–77.——We are satisfied, on re-examination, that we exaggerated the number of errors in Mr. Sewall's 'Latin Speaker' (*Nation*, No. 703). When we said it contained "hundreds" we used a reprehensibly loose expression for a great number. There are, in fact, far too many—enough to justify our censure. ——The republication, by Paul Gaffarel, of André Thevet's 'Les singularitez de la France antarctique' is worthy the notice of collectors of Americana. Although the original, published in 1558, is very rare, the present reprint makes no pretence to be an *édition de luxe*. The editor frankly admits that Thevet was often incorrect when he went beyond his own personal observation, that he was far from profound, that his style is poor; yet he asserts "that without 'Les singularitez de la France antarctique' a number of valuable particulars in regard to America would never have been rescued from oblivion." It is singular that Harrisse, an undoubted authority in American bibliography, has omitted to mention it in his 'Notes pour servir à l'histoire de la Nouvelle France,' though it contains much material relating to Canada as well as to Brazil. Some of the quaint engravings found in De Bry's famous compilation appear in this volume as woodcuts and reduced in size.——The German papers announce the approaching publication of a work on the Philosophy of Universal History by the venerable Leopold von Ranke, and the first volume of Treitschke's 'German History in the Nineteenth Century,' in which the period embracing the Peace of Vienna is treated.——A valuable diary, 'Unter der Pariser Commune,' has been published by Wilhelm Lauser, of the staff of the Vienna *Presse* (Leipzig: Duncker & Humblot). It forcibly portrays the chief Communistic leaders——The Smith Female College, at Northampton, Mass., has lately been spending a part of its income in collecting American pictures. The selections are making by the President, Mr. Seelye, and the newly appointed Art-Professor, Mr. Champney, who will perhaps henceforth drop his well-known diminutive of "Champ." Pictures already bought are Coleman's "The Desert," lately seen in the Decorative Art Society's exhibition; a cattle-piece by J. M. Hart, exhibited last season at the Academy; Swain Gifford's "Old Orchard near the Sea"; with Sartain's "Narcissus," and possibly his "Arab Coffee-house in Algiers."

—We have received from Mr. B. F. Stevens, London, three recent specimens of the admirable work of the Chiswick Press, of which he is manager. One, to begin with the smallest, is a 32mo reprint of 'Divine Breathings; or, A Pious Soul Thirsting after Christ in a Hundred Pathetical Meditations,' of which a fifteenth and the only known original edition was published in London in 1775. In respect of size and of the title-page, at least, this may be called a fac-simile, but the little volume is less remarkable for its typography than for the novel binding; the covers, inside and out, being stamped with gilt or printed with colored ink in a pretty vine pattern, of which endless variations suggest themselves. Dodd, Mead & Co. are the American publishers of this pious vade-mecum, in violent contrast with which, both as to contents and garb, are M. Louys Glady's two temptations to the bibliophile, namely, the Abbé Prévost's 'Manon Lescaut,' and Amyot's old version of 'Daphnis et Chloé,' to each of which M. Alexandre Dumas, fils, furnishes a preface. These volumes are genuine trophies of the Press. Their form is well chosen for the hand (4×6 in.), and 250 of the 333 copies printed are upon Turkey-Mill paper of beautiful quality. Each edition has its peculiarity of imprint, making it unique. The 'Manon Lescaut' has a delicate red line between the running-title and the text, both of which are in black ink. Red is used elsewhere, on the title-page, for the initial letters, and for certain quoted passages in the preface; but the red line was, M. Glady declares, never thought of before since books began to be made and adorned. It certainly lends great elegance to the page. The distinctive peculiarity of 'Daphnis et Chloé' is one much more trying to the pressman, for it involves the separate printing in color of the stops, even to hyphens, and apostrophes. This is true only of a limited portion of the volume—in fact, of the title-page, *avis*, and preface, and of the running-titles. But the entire text is in blue for the body color, plentifully interspersed with passages or even sentences and words in red. The blue by itself we have found not disagreeable to the eye; the combination not very restful. However, the *édition Glady* is not meant so much for readers as for collectors, and it is just as well that it should be so and that the edition should be limited. M. Alexandre Dumas expressly warns off a large class of readers, the young of both sexes, leaving their elders to judge if he be not right in praising the pagan 'Daphnis et Chloé' for its Christian graces, and declaring its God to be preferable to the God of 'Paul et Virginie'; so that mankind would fare better (supposing the race to spring up anew after another Deluge) with the former than with the latter, had these two works alone escaped destruction. This is fantastic enough, but in his introduction to 'Manon Lescaut' his morality is even queerer; and he actually contrives to make the comment more objectionable to a pure mind than the text. In short, if the bibliophiles only knew it, they have in Dumas's prefaces something more curious than the publisher's *filet rouge* or *tirage à part*. M. Glady's next venture in the same series is to be La Rochefoucauld's 'Maximes,' limited to twenty-two copies at fourteen dollars each! And Dumas's 'L'Homme-femme' will follow, in red and blue.

—The Annual Report of the President of Harvard College is unquestionably the most important and instructive periodical contribution to educational literature in this country. That for 1877–78, now before us, is as remarkable for its facts and its suggestions as any of its predecessors. To what other college report should we look for a discussion

of the scholarship system as judged by its practical results for twenty years; for statistics of the working of the elective experiment and the experiment of voluntary attendance at recitations; for a challenge to boarding-housekeepers in the shape of a table showing the local retail prices of provisions in 1858–9–60 and 1878; for the latest account of the progress of the examinations for women? Nor is this all that is interesting between these covers, for the heads of the several schools and departments, the Observatory, the Library, the Museum, etc., all have something to contribute to the impressive picture of the vitality of the University, and the hold which it has upon a vast and generous circle of alumni and friends. Mr. Winsor's proposal to place electric lights in the roof of the reading-room, in order to keep it open in the evening, is a type of the spirit of improvement which has of late years so transformed the institution.

—Apart from the prices of board at Memorial Hall, what will most engage the attention of parents of slender means is President Eliot's vindication of endowments in aid of poor scholars. We shall be greatly surprised if it do not also have the effect of multiplying the endowments themselves, rapidly as they have increased in the past ten years. The whole number of scholarships is now 112, and of these 32 have been added within the decade. The money paid on them during 1852–78 has been $275,634 20, and the present annual payments amount to about $25,000. The recipients for the twenty years 1853–72 numbered 280, of whom all graduated but seven, and all but twenty-eight survive, though eight have been "utterly lost sight of, nothing having been heard of them for years, either by the college authorities or their classmates." To the remaining 237 a circular letter was addressed by President Eliot, calling for an account of their occupation since leaving college, of their opportunities of usefulness, of their health, and of the influence of the scholarship upon their subsequent career. The answers to these questions have proved extremely interesting, and have confirmed President Eliot's belief in the public utility of this kind of endowment. He gives a number of extracts from them in illustration of the several ways in which the scholarships afford support and encouragement to those whose education depends sometimes wholly upon them. He also attenuates "the fact that very little of the scholarship money paid out since 1852 has been repaid," by referring it to a natural lack of means rather than of a sense of obligation, and by arguing that repayment may be made "in services to the college, to learning, to young men in need of like help, or to education in general." That this sort of payment has been made is evident from the table of ascertained employments, as follows: teachers for life, of all grades, 63; ministers and missionaries, 32; lawyers, 87; physicians, 19; business men, of all grades, 26; librarians, 3; journalists, 6; civil engineer, 1. Law, physic, and divinity have a notable proportion of votaries; science a notable deficiency—a fact explainable, we suppose, by the comparative ease with which a start in medicine or in legal practice or in preaching can (or could) be made, the beginner maintaining himself, while studying, by teaching or otherwise. It would have been at least curious to enquire whether men who rely upon scholarships in coming to college have already a more definite choice of profession than the majority of students.

—Among the articles in the current number of the *Princeton Review* which discuss questions of the hour, that of Professor Draper on the political effect of the decline of faith in Continental Europe will be read with especial interest. His views are presented with a vigor of expression, a philosophical depth of insight, and a judicial impartiality which are decidedly impressive. At the same time we cannot but notice a fault sometimes remarked in others of his philosophic-historic writings—a dropping of the subject before the reader feels that he has quite reached the conclusion. Not only does the author draw no moral, but the reader is in doubt what moral he is expected to draw, or whether, indeed, any moral is intended or any general conclusion aimed at. In the opening pages we are led to believe that it is designed to show that Nihilism, Communism, and Socialism are all due to the decline of faith, which we naturally understand to refer to the wave of unbelief which is now sweeping over the Continent. We are then rapidly carried back to the Middle Ages, for the purpose, as the reader will suppose, of establishing this proposition. We are next shown how well the old religious system was adapted to prevent any such sentiments as those which give rise to the forms of Socialism now prevalent—a view which chimes in very well with the line of argument—and are informed categorically that it is the total extinction of religious belief which has given birth to the Nihilist, the Communist, and the Socialist. The reader now naturally expects to see the gulf of those centuries between the Reformation and the present era of infidelity bridged over, and to be shown whether it is to the latter or to the downfall of priestly control that the evil is due. But he is entirely disappointed. He is treated first to a most striking and picturesque view of religious society and ideas in the Middle Ages, in which its cruelty and absurdity are shown in the strongest light. Then, with a few remarks of a general nature, he is abruptly left hanging in mid-air, without any definite idea of the lesson he has been taught. We are sure that every reader of the *Review* would be glad to have Dr. Draper return to the subject, and be a little more specific as to the particular decline of faith referred to. We should also hope to see him consider the apparent deduction from his premises that humanity has no choice between a barbarous suppression of free thought—a return, in fact, to the policy of the Middle Ages—and the steady growth of anarchical principles among the uneducated classes. Other articles which will attract attention are a review of the Monetary Congress and coinage legislation from the double-standard point of view, by Professor Walker, and an article by Judge Cooley on the inter-State surrender of fugitives from justice.

—The last number of the *American Law Review* contains an elaborate article on inter-State extradition which shows how the notion of executive "discretion," such as that claimed in the Kimpton case by Governor Rice, of Massachusetts, has grown up. As the writer of the article, Mr. I. T. Hoague, points out, there is no evidence that at the time of the adoption of the Constitution, or for half a century later, anybody dreamt of the existence of such a right. As to the judicial view of the subject, he says: "A review of the judicial opinion upon the character of the obligation imposed upon the State and the executive shows that the courts have almost uniformly held that the duty is imperative, and that the executive has no legal right definitively to withhold a warrant when the papers are regular." The process by which State governors have gradually inflated their jurisdiction in extradition cases from the mere ministerial duty of identifying and surrendering the fugitive into the judicial function of trying and pardoning them, the trial involving an enquiry into the *motives* of the State in demanding the extradition, is a curious illustration of the dangers which are inherent in the exercise of any one's irresponsible power. Mr. Hoague seems to think that there is no remedy for the present chaotic condition of things savethrough the action of the States themselves; that Congress cannot interfere. He says: "There appears to be no possible way by which the question of executive discretion can come before the courts in a manner to secure a direct judicial opinion upon it." We cannot see, however, any reason why the general Government should not provide for a judicial determination of such questions as arise in extradition cases.

—The *Law Review's* article does not touch upon extradition between sovereign governments, nor on the question of the trial of fugitives for offences other than those for which they have been surrendered. We see that the Court of Appeals of Kentucky, in a case recently reported, has decided in favor of the view that such trials are contrary to the spirit and letter of our treaty with Great Britain. This view we have always maintained in these columns, and the opinion of the Kentucky court, in which the arguments pro and con. are thoroughly examined, puts the matter on the ground that we have always urged, viz., that inasmuch as the whole practice of extradition rests on treaty stipulations, each country must be strictly governed by these, and, as in the Treaty of 1842 with England, there is an enumeration of extraditable crimes, to secure the surrender of a fugitive for one of these, and then to try him for a crime not extraditable, is practically a violation of the Treaty. Mr. Fish's theory that the omission of any reference in the Treaty to religious and political offences was due to the fact that a surrender for such offences was on both sides regarded as "inherently impossible," and his curious comparison of this omission to the absence in the "laws of Solon" of a punishment for the crime of parricide, is not treated with much consideration by the Kentucky court. The case in which the decision was rendered was that of a man named Hawes, indicted in Kentucky for forgery and embezzlement. He fled to Canada, and, having been extradited on the charge of forgery under the Treaty of 1842, the Kentucky prosecuting attorney undertook to try him on the indictment for embezzlement. The judges decided not only that he could not be tried for this offence but that he must be discharged from custody. This case is referred to with approval by Judge Cooley, of Michigan, in the interesting article in the *Princeton Review* referred to above, in which he discusses the subject of executive "discretion," and reaches the conclusion that the claim of State governors of a "discretionary authority

to obey or refuse to obey requisitions" is one of the chief difficulties in the process of extradition between the States. His article also contains a remark (made in reference to the Kentucky decision), which we may commend to the attention of Mr. George Bliss. "To obtain the surrender of a man on one charge, and then put him upon trial on another, is a gross abuse of the constitutional compact. We believe it to be a violation also of legal principles."

—There seems to be trouble brewing between the *Tribune* and the *World*, two newspapers which, though not always taking the same view of political questions, endeavor to treat each other, as a rule, even when engaged in what is popularly known as "controversy," with forbearance, if not deference. The *World*, for instance, has studiously refrained from touching upon the vexed question of the cipher despatches, and the same motives of delicacy which have governed its action in this case have prevented the *Tribune* from expressing any opinion upon the struggle on behalf of free municipal institutions which the *World* has been engaged in against the "Council of Four," or, in other words, the Board of Estimate and Apportionment. The *World* has recently made a great journalistic hit in its Christmas "prize-questions," a device for increasing its circulation and the interest of its subscribers, which, though we believe not original with it (the idea having been taken from an English paper), has proved a remarkable success. It is a well-established fact that there is no exertion which will not be made for a competitive prize, even though the amount of labor and time involved is out of all proportion to the object in view; and taking advantage of this fact the *World* has developed and brought to perfection a new branch of journalism, and, better still, of Sunday journalism. The Sunday newspaper, as those who are familiar with the journalistic world know, differs from the ordinary secular issue in containing even more food for study than the latter. Whether because it is felt that the profession ought to take a higher stand on Sunday than on other days, or because many contributions which are "crowded out" on secular days for "want of space" are found at the end of the week to be well fitted for the contemplative mood of the Sunday-reading public, the paper is certainly made on the first day of the week a very different thing from what it is on any other day. The subscriber generally finds that not only has the editor provided him with the usual amount of news, but has given him in addition an exciting tale, several poems, a number of extracts from magazines and reviews, and even information and advice on various subjects, such as the proper method of cooking particular dishes, the means of economical housekeeping, the proper behavior of persons contemplating the formation or rupture of matrimonial engagements, and so on. There is nothing more indicative of the trusted position which those who follow the profession of journalism are gradually acquiring in the community than the assumption of this advisory character by the Sunday newspaper. It is clear that it could not be successfully assumed without great mutual confidence. The *World's* "prize-questions" show how far this will go, for with the exception of the mutual trust inspired by long experience there was absolutely no guarantee of judicial fairness or impartiality in the distribution of the prizes, inasmuch as it was impossible for those who took part in the competition to tell whether they had answered such a question as "Who invented milk-punch?" or "Who wrote 'Rattle his Bones over the Stones'?" either better or worse than other unknown competitors. Yet such was the trust which the management of the Sunday *World* justly inspired that several hundred persons are understood to have entered the lists, and the distribution of the Christmas prizes is to be followed by another at Easter, the questions for which are harder and more ingenious than the first list. In fact, it may be said to be quite as remarkable that any one should be able to ask the questions as that anybody should be able to answer them. Why this well-earned professional success should have aroused the jealousy of the *Tribune* we cannot understand.

—The company which Mr. Wallack has got together for this winter at his theatre is certainly far superior to any stock company in the city, unless it be that of the Union Square; but the production of Mr. Paul Merritt's "At Last" seems almost like a wilful attempt to try the effect upon the public of a thoroughly second-rate play thoroughly well acted. The plot of "At Last" is not absolutely new: we have the familiar character of the trusted clerk in a mercantile house who is wrongly accused of a forgery which has really been committed by one of the junior members of the firm; his wife, who suspects him of infidelity to her; the forger himself, who is in love with the wife; and the two comic characters, who marry each other in the end. *Richard Roxby*, the clerk (Mr. C. F. Coghlan), disappears and is supposed to be dead; *Annie Roxby*, the wife (Miss Coghlan), thinking him dead, agrees to marry *Austin Granby*, the forger; when, of course, her husband returns under an assumed name, while at the same time *John Garland* (Mr. Wallack), who is looking for *Roxby* (as the latter supposes to hand him over to the police, but really to make clear his innocence), appears on the scene. In the end there is a reunion between husband and wife, the forger is discovered, *John Garland* marries *Mrs. Sparkleigh* (Miss Effie Germon), and all ends happily. The low comedy was furnished by Miss Germon and Mr. Floyd, who has great skill in taking the part of the imbecile lover. Mr. Wallack, as the bluff, honest, self-sacrificing *John Garland*, acted particularly well, and Miss Coghlan did as well with her part as its peculiar nature admitted. The author seems to have made the mistake which dramatists of the present day so often fall into, of imagining that a psychological study apart from action can be interesting on the stage. In a novel, where the reader has time to follow the delicate play of motives on character, and the *growth* of character itself, analysis may be pushed very far, as every one who is familiar with George Eliot's novels well knows. On the stage, where everything must be striking and where there is little or no possibility of the author's playing the part of chorus, the vacillation of a woman's emotions, except so far as they are closely connected with the action of the play, are of little interest. We can easily imagine *Mrs. Roxby* in a novel a very interesting character; on the stage she is chiefly enigmatical. But taking the play for granted, we have not seen better acting for some time. Mr. Wallack, whose defect is exaggeration, showed no tendency to overdoing the part of *John Garland*, and Mr. Coghlan acted that of *Roxby* with all his usual delicacy and refinement. Miss Effie Germon, too, was very strong as *Mrs. Sparkleigh*.

—To the lover of the stage the fortunes of a theatre like Wallack's are necessarily more than ordinarily interesting, because its management is generally marked by a desire, not too often apparent elsewhere, to keep up the standard of legitimate comedy. The difficulty of doing this may, in a certain sense, be gauged by the performances of such a theatre. The prevailing taste of to-day is distinctly opposed to what is commonly known as legitimate, or what used to be called "genteel," comedy, having been completely vitiated (a lover of the old drama would say) by sensation melodrama and burlesque. One great difficulty, too, in keeping up a stage devoted to it is, that there is so little in existence. For a revival the "School for Scandal" or the "Rivals," or even the "Road to Ruin," will do very well; but the attempt to keep these plays permanently alive anywhere has always of recent years failed. There are not more than a dozen modern English plays to take their place, Byron, Robertson, and Gilbert being almost the only dramatists of the last twenty-five years who have succeeded in producing dramas which have a distinct character and interest. The discovery that it is much easier to pirate or import French plays than it is to get good ones written in English has flooded the stage with the dramas of Sardou, Dumas, and other Parisian dramatists, the success of whose plays in this country is a striking proof of the non-national character of the modern theatre in English-speaking countries. If we were not perfectly familiar with the fact, it would seem incredible that one theatre (and that one of the best in the city, the Union Square) should be almost exclusively devoted to the production of new French plays. This, however, is not "legitimate" comedy; and Mr. Wallack, we believe, rigidly excludes French plays, as such, from his theatre. But the straits to which he is driven are shown by his bringing out a play like "Forbidden Fruit," which, as produced by him, was English only so far as the names of the places and people were concerned. Wallack's is, in fact, after a gallant resistance for many years, obliged to yield to a certain extent to the current, though it still does what it can to make the public taste conform to its traditions—a task which, when undertaken with a genuine modern comedy like "Ours," is generally more successful than in the case of revivals.

—The recently published report of the hearing before the City Council of the City of Cambridge on a late petition for the protection of the purity of the water-supply of that city, suggests some interesting points. The water comes from a pond on the borders of the city; and a large slaughter-house is being erected on the further side, in the adjoining town of Belmont, near enough to threaten very serious injury, and arouse great alarm. The city has no jurisdiction there, and the town of Belmont cannot see any harm in a plan that adds so much to its taxable property. The State Board of Health cannot act under the statutes creating it until damage is actually done, and the city cannot wait until the soil around the pond is poisoned. Proceedings against the nuisance by information

of the State-Attorney were not proposed. The only plan advocated was to purchase the land around the pond, and then to obtain from the legislature jurisdiction over it, with power to extinguish the ice-rights which make the spot especially suited for slaughter-houses. This indirect remedy would involve unknown but certainly very great expense, and its success would be extremely uncertain ; but it was alleged to be the only way of protecting the purity of the water upon which the health of the city depends—a position full of interest to other cities whose water may be similarly endangered. Perhaps the most curious thing about the matter was that it was shown that the city had for a long time been itself doing, on a large scale, the very thing complained of in Belmont—no less than three city sewers emptying on the swampy tract immediately adjoining the pond ; and that this swamp with almost no outlet, and separated from the pond only by embankments and an imperfect wooden bulkhead, had already been complained of as an intolerable nuisance by another adjoining city. The matter has been put over by the City Council to another year, and it has not apparently as yet occurred to any of the city fathers that a sewer to carry all this filth off to salt-water would have its strong points.

HODGSON'S MEMOIR.*

THE Rev. Francis Hodgson is known as the translator of Juvenal, the provost of Eton who, among other reforms which made his administration illustrious, abolished Montem, and the friend to whom Byron addressed some familar poems. This memoir of him is written "on the principle that a man may more accurately be known by his friendships than in any other way," and since among Hodgson's friends were cultivated men like Scrope Davies, Harry Drury, and J. H. Merivale, besides Lord Denman the Chief-Justice, Lord Byron and his sister, we have here two volumes of entertaining correspondence. The new matter relating to Lord Byron, to whose affairs mainly we shall confine this notice, is especially interesting because it shows how he revealed himself to Christian friends, and the estimate they placed upon his character and conduct. Byron came to Cambridge early in 1808 to obtain his M.A. degree, and there first met Hodgson, who was a Fellow and Tutor at King's. Both were ardent disciples of Dryden and Pope, and followed similar pursuits ; a closer bond existed in the fact that Hodgson had lately printed a satire upon the *Edinburgh Review*, in reply to its severe criticism of his Juvenal, and Byron was then meditating the "English Bards and Scotch Reviewers." A warm attachment was formed, and during Byron's absence from England on his first voyage to the East, Hodgson was his only English correspondent except his relatives, as is more than once somewhat bitterly remarked by the poet in a series of characteristic letters. Few new facts are contained in these, but they afford fresh illustration of his moods and habits while abroad. Here is a compliment to his fellow-traveller, Hobhouse : "I am for Greece, Hobhouse for England ; a year together on the 2d of July since we sailed from Falmouth ; I am confident that twelve months of any given individual is perfect ipecacuanha." And here is a glimpse of his Athenian life : "My domestic affairs being, moreover, considerably deranged, my appetite for travelling pretty well satiated with my late peregrinations, my various hopes in this world almost extinct and not very brilliant in the next, I trust I shall go through the process with a creditable *sang froid* and not disgrace a line of cutthroat ancestors. . . . Talking of marriage puts me in mind of Drury. . . . I will never forgive matrimony for having spoiled such an excellent bachelor. . . . My Attic feast went off with great *éclat*. I have had a present of a stallion from the Pasha of the Morea. I caught a fever going to Olympia. I was blown ashore on the island of Salamis, on my way to Corinth through the Gulf of Ægina. I have kicked an Athenian postmaster. I have a friendship with the French Consul and an Italian painter, and am on good terms with five Teutones and Cimbri, Danes and Germans, who are travelling for an academy." Again : "I am returning *home* without a hope and almost without a desire." Hodgson met him in London, and shortly after Byron enclosed to his friend the following lines, which by some strange chance have hitherto escaped publication :

"NEWSTEAD ABBEY, Aug. 26, 1811.

I.

" In the dome of my sires, as the clear moonbeam falls
Through silence and shade o'er its desolate walls,
It shines from afar like the glories of old ;
It gilds, but it warms not—'tis dazzling, but cold.

II.

" Let the sunbeam be bright for the younger of days ;
'Tis the light that should shine on a race that decays,
When the stars are on high and the dews on the ground,
And the long shadow lingers the ruin around.

III.

" And the step that o'erechoes the grey floor of stone
Falls sullenly now, for 'tis only my own ;
And sunk are the voices that sounded in mirth,
And empty the goblet, and dreary the hearth.

IV.

" And vain was each effort to raise and recall
The brightness of old to illumine the hall ;
And vain was the hope to avert our decline,
And the fate of my fathers has faded to mine.

V.

" And theirs was the wealth and the fulness of fame,
And mine to inherit too haughty a name ;
And theirs were the times and the triumphs of yore,
And mine to regret, but renew them no more.

VI.

" And ruin is fixed on my tower and my wall,
Too hoary to fade and too massy to fall ;
It tells not of time's or the tempest's decay,
But the wreck of the line that have held it in sway."

The habitual moodiness of Byron was at this time deepened by the successive deaths of several dear friends, among them the brilliant Charles Skinner Matthews, to whose influence Byron's friends attributed much of his scepticism, and Hodgson chose this moment to press upon him the consolations of religion. The letters of Byron in reply are flippant and boyish, and contain no original statements or thought, but they form the most explicit account of his scepticism. He dwells on the fate of the heathen, and contrasts the morality of the Mussulmans he has seen with that of worldly Christianity, and says he "will have nothing to do with your immortality," being miserable enough already. He objects to the Atonement as unjust and inadequate, and continues (to quote a characteristic passage) : "You degrade the Creator, in the first place, by making him a begetter of children ; and in the next you convert him into a tyrant over an immaculate and injured Being who is sent into existence to suffer death for some millions of scoundrels, who after all seem as likely to be damned as ever. . . . I trust that God is not a Jew. . . . And our carcasses which are to rise again, are they worth raising ? I hope, if mine is, I shall have a better *pair of legs* than I have moved on these two-and-twenty years, or I shall be sadly behind in the squeeze into Paradise. . . . *I deny nothing*, but doubt everything." Doubtless the last sentence sums up the whole matter as it then lay in his mind. It is clear that Hodgson's effort at conversion was more the act of a friend than of a clergyman, and was made with great kindness and tenderness. William Harness, who was present at Newstead with Hodgson and Byron at this period, writes : "I cannot even now, at a distance of more than fifty years, recall those conversations without a deep feeling of admiration for the judicious zeal and affectionate earnestness (often speaking with tears in his eyes) which Dr. Hodgson evinced in his advocacy of the truth." Byron says he was sincere in these letters, and there is no reason to suppose he was not ; but those who believe he was insincere in his poems will find an amusing confirmation of their opinion in a note which Hodgson affixed to the "Epistle to a Friend," written to him at this time in reply to a poetical epistle of his own. When he gave the lines to Moore for publication he marked for omission the following lines, which Moore nevertheless published :

" But if in some succeeding year,
When Britain's 'May is in the sere,'
Thou hear'st of one whose deepening crimes
Suit with the sablest of the times ;
Of one whom love nor pity sways,
Nor hope of fame, nor good men's praise ;
One who, in stern ambition's pride,
Perchance not blood shall turn aside ;
One ranked in some recording page
With the worst anarchs of the age :
Him wilt thou *know*, and, *knowing*, pause,
Nor with the *effect* forget the *cause*."

In the margin we read, "N. B. The poor dear soul meant nothing of this. F. H.," and we are reminded of Scrope Davies telling Byron a year or two before that his actions were "much more like silliness than madness." Not long after this Byron did one of the few generous acts of his life and gave Hodgson a thousand pounds to extricate him from debt, and, from Bland's account of Byron's talk over it, it appears to have been done in a spirit which it is very pleasant to know of.

Passing on to the days of the marriage of Byron, it is nearly impossible to believe, in view of this correspondence between Hodgson and Byron's sister, Augusta Leigh, that any great crime was the cause of the separation of Lord and Lady Byron. At first, as we know, all was rose-color. Hodgson writes to his future bride, "He is likely to be *as happy as*

* 'Memoir of the Rev. Francis Hodgson, B.D., Scholar, Poet, and Divine. With numerous letters from Lord Byron and others. By his son, the Rev. James T. Hodgson, M.A. In two volumes.' London and New York : Macmillan & Co. 1878.

I am." Immediately after the marriage Mrs. Leigh writes to Hodgson, "I think I never saw, or heard, or read of a more perfect being in mortal mould than she (Lady B.) appears to be, and scarcely dared flatter myself that such an one would fall to the lot of my dear B. He seems quite sensible of her value." These expressions of Mrs. Leigh's sense of Lady Byron's worth continue long after the separation. When the separation took place, unexpectedly to all, Mrs. Leigh summoned Hodgson to London ; and he, seeing no better course, appealed to Lady Byron in two letters, of which only one remains, but both Lady Byron's replies are preserved. In his own letter he says :

"After a long and most confidential conversation with my friend (whom I have known thoroughly, I believe, for many trying years), I am convinced that the deep and rooted feeling of his heart is regret and sorrow for the occurrences which have so deeply wounded you ; and the most unmixed admiration of your conduct in all its particulars, and the warmest affection. But may I be allowed to state to Lady Byron that Lord B., after his general acknowledgment of having frequently been very wrong, and, from various causes, in a painful state of irritation, yet declares himself ignorant of the specific things which have given the principal offence, and that he wishes to hear them, that he may, if extenuation or atonement be possible, endeavor to make some reply ; or, at all events, may understand the fulness of these reasons which have now, and as unexpectedly as afflictingly, driven your ladyship to the step you have taken."

To this Lady Byron replies, "I married Lord Byron determined to endure everything whilst there was *any* chance of my contributing to his welfare. [So, too, Mrs. Leigh to Hodgson, "Lady B. *sets about* making him happy in quite the right way."] . . . My security depended on the total abandonment of every moral and religious principle. . . . The circumstances shall not be generally known while Lord B. allows me to spare him. . . . You will continue Lord Byron's friend." In her second letter she writes : "I believe the nature of Lord B.'s mind to be most benevolent. . . . In regard to any change which the future state of Lord B.'s mind might justify in my intentions, an amicable arrangement would not destroy the opening for reconciliation." Reconciliation was still possible, then, and her missionary work might begin anew. No one can read the correspondence through without deepening the impression that the separation resulted from the natural interference of two so diverse natures, that Lady Byron may have harbored some fancied wrong of which she had no certain evidence, and that Lord Byron never knew, except indirectly, what was charged upon him. As he himself said, the causes were too simple to be easily discovered. Lady Byron's character is satirically but accurately, as we believe, described in the irony of her gardener, who, "seeing a beautiful flower in full bloom on a neglected pathway, observed 'Lady Byron would have called that a weed.'" Afterward Hodgson seems to have modified his high opinion of Lady Byron. "My God ! how cruel, how utterly revengeful is the letter of his *widow*," he writes to Drury. Not long after Hodgson's failure to effect a reconciliation Byron left England, and but few letters passed between the friends. Hodgson's career was brilliant and useful, but Byron's estimate of him, in a letter to Moore, is substantially just, and with it we must close this notice : "I hear that Hodgson is your neighbor, having a living in Derbyshire. You will find him an excellent-hearted fellow, as well as one of the cleverest ; a little, perhaps, too much japanned by preferment in the Church and the tuition of youth, as well as inoculated with the disease of domestic felicity, but a very worthy man." We were surprised to see the author of the memoir attributing the lines written in his Bible to Byron's own pen, and regretting their omission from his complete works. Byron appears to have quoted from memory, at least incorrectly, the lines,

"Within that awful volume lies, etc.,"

which Sir Walter Scott puts into the mouth of the White Lady of Avenel ('The Monastery,' p. 213, vol i. ; Scott's Complete Works, Riverside Poets, vol iv., p. 215).

KING'S SYSTEMATIC GEOLOGY.*

AMONG innumerable geological surveys in this country and elsewhere the exploration on the line of the fortieth parallel has, for various reasons, excited high hopes of considerable results, and particularly because it undertook to make one continuous section of the earth's crust through the broadest expansion of the American mountain system, at right angles to the great line of mountain elevation. Such an effort, properly directed, could hardly fail to make the rocks yield their secrets, and perhaps tell the story of their birth with a clearness never yet attained. The task is now done. After more than ten years' labor, Mr. King sums up the results of his own and his associates' work in this volume on the systematic geology of the region they have surveyed. Four similar publications by his associates have already appeared, together with a series of superb maps. The present volume, last in order of time, but numbered as first in the series, is devoted to a general view of the scientific results and conclusions of the survey, all the more interesting because of Mr. King's very high reputation, in regard to which, strangely enough, the popular impression seems for once to be in accord with scientific opinion.

The book contains eight chapters, the first and sixth being respectively the introduction and the résumé of the stratigraphical geology. Between these come four chapters which form the bulk of the volume, and may be almost said to contain a practical treatise on the systematic geology of the four great periods of geological time—the Archæan or Azoic, the Palæozoic, Mesozoic, and Cenozoic ; so complete is the picture which is offered by the region surveyed. Each of these chapters is accompanied by an exquisitely finished map, with supplementary maps of the glaciers and lakes of the glacial period. The seventh chapter deals with the subject of tertiary volcanic rocks, with a section embracing volcanic rocks in general and another map. Finally, an eighth chapter with four maps deals with the orography of the district, or the nature of its mountain elevations. Here, then, is a systematic section, covering sixteen degrees of longitude, or some eight hundred miles of contiguous mountain ranges, and disclosing all the broader divisions of geological time through not less than 125,000 feet, or more than twenty-two miles' thickness, of visible sedimentary deposits. The briefest possible summary of its results is, of course, all that can be attempted here at present.

Of the Archæan or Azoic period 60,000 feet of eruptive granites or metamorphic crystalline schists are displayed, representing an original sedimentary deposit of at least twice that thickness. The metamorphosis from sedimentary beds into crystalline schists took place before these were folded up in mountain ranges, and under the pressure of a very great thickness of material which disappeared before the Palæozoic age, so that the division between Azoic and Palæozoic is sharp, and even the granites which, together with the metamorphic crystalline rocks, form the Archæan bed-rock, never intrude through fissures or crevices into later deposits. The Archæan age is perfectly distinguishable and distinct from all that followed. Subjected to immense changes even in Archæan times, one single fracture or fault presenting a face of 30,000 feet, far exceeding any known recent example, the Archæan bed-rock offers nevertheless so clear a boundary line as to give great simplicity to the whole geology of the region, while its features have controlled subsequent topographical features and acted as the local cause of modern mountain ranges.

Mr. King gives a conjectural section of the Archæan topography. At his eastern limit in Colorado and Wyoming the Medicine Bow and Park ranges were then, as they still are, the highest elevations. To the westward of these masses a series of depressions, broken at intervals by local elevations, extended some 600 miles to longitude 117° 30′, where continuous highlands began, of unknown altitude and area, but extensive enough to be considered as a continent, and called for convenience' sake the western continent Pacifis. In this long stretch of 600 miles the most remarkable single feature was the sudden fault which threw up the Wahsatch range 30,000 feet above the region to the westward, making of the Wahsatch the great line of topographical and geological demarcation between the country east to the Mississippi and west to the Sierra Nevada.

What passed between the Archæan and the Palæozoic age is unknown, but when next the record becomes intelligible a huge ocean stretched from the Pacific continent eastward, in which the summits of the Wahsatch and Medicine Bow, where they appeared at all, appeared as islands. During another indeterminable era of rest, deposits which, amounting only to about 1,000 feet in Colorado, deepened to 40,000 feet on the more rapidly subsiding coast of Pacifis, were laid down by the Palæozoic ocean. Then followed the most extraordinary of all orographical phenomena. The Archæan continent Pacifis, which during countless ages had poured vast masses of detritus in layers ten and fifteen thousand feet thick on the Palæozoic ocean floor, which bent and sank under the weight, now, instead of rising lighter on account of the lost material, suddenly and with a vast catastrophe sank and became the floor of a Mesozoic ocean, while at the same time the whole region to the eastward, as far as the Wahsatch,

* 'Systematic Geology. By Clarence King, U. S. Geologist.' Illustrated by twenty-eight plates and twelve analytical geological maps, and accompanied by a geological and topographical atlas. Washington : Government Printing-Office. 1878. Pp. 803.

rose above the water and became a Mesozoic continent, sending down in its turn vast masses of detritus to the westward, thus restoring the lost material to its ancient place, until, at the close of the Jurassic age, 20,000 feet of conformable sediment had accumulated upon the Archæan ocean-bed.

East of the Wahsatch this great change was not felt. A shallow sea still washed the few Archæan islands, and the Mesozoic sediment was deposited conformably on the east carboniferous strata, from the Wahsatch as far as Kansas. But while this long period of undisturbed ocean deposit continued on the eastern side to the close of the Mesozoic, another profound disturbance at the end of the Jurassic age had again elevated the region of the submerged Pacifis, and, by a process of shrinkage amounting to ten per cent. of linear compression, had created long ranges of mountain peaks which rose as islands in the cretaceous ocean. This arrangement lasted until a post-cretaceous disturbance uplifted the whole region of the Cordilleras and banished the ocean from it. Since this upheaval no marine waters have ever invaded that portion of our continent. Their place was taken by huge fresh-water lakes, the deposits in which mark the passage of all more recent time. The Pliocene period produced an upheaval along the old line of the Wahsatch fault, tilting the whole district on the eastward and giving it a free drainage to the sea; while on the west it left two deep depressions which, in Quaternary or recent times, received the waters of the glacial age and made the beds of two huge lakes, of which the Great Salt Lake and Carson Lake with the neighboring waters still remain. There was, however, no general glaciation, and the region had no share in the ice-bed which covered the northern part of the Appalachian continent. Its glacial system was comparatively feeble.

In all this series of movements the most remarkable are the startling vertical elevations and depressions, and especially those which occur along two lines of weakness, one at the eastern base of the Sierra Nevada, the other at the western base of the Wahsatch. At this latter point there is proof of an Archæan dislocation of thirty thousand feet, and an Eocene dislocation of forty thousand feet, besides smaller movements. Extreme elevation and extreme depression went together on the same weak line through geological time.

The ordinary and recognized type of depression is that of a loaded area sinking slowly into the solid earth under the gradual accretion of enormous sediments in ocean bottoms, the equilibrium of the earth's crust restoring itself by a similar slow movement of expansion elsewhere. This well-known process of subsidence is frequently seen on the fortieth parallel, but side by side with it appears a very different type—enormous faults which bear every sign of having been violent and catastrophic, indicating in one extreme case not less than eight miles of vertical movement; lines of fault permanent through eras of time such as no one would venture to express in years; continents elevated to an abnormal height, then gradually lightened by denudation of some miles of superincumbent thickness of rock, and finally suffering paroxysmal depression. Mr. King has been the first observer who has given careful study to this phenomenon, which really represents a new geological force and offers a problem so interesting that, if the laws which regulate it could be ascertained, geology might become a science in a new sense, and many of the most serious difficulties in studying past and even future changes in the earth's history might be overcome. Tremendous as the riddle is, Mr. King has undertaken to grapple with it. He suggests a possible solution which, in the want of facts that belong to the region of terrestrial thermodynamics, he does not pretend to work out with a formula. This theory will be found on pp. 700–705 of the volume. It rests on Sir William Thomson's theory of secular refrigeration, but it is far too technical to bear abbreviation, much less criticism, and we leave it to scientific periodicals to discuss.

No such difficulty stands in the way of stating Mr. King's law of the genesis of granite. This is a merely mechanical theory, intelligible even to laymen. Sedimentary beds subjected to direct superimposed pressure powerful enough to sink them to the necessary thermal conditions become crystalline schists and gneisses. If thereupon a sufficiently powerful horizontal or tangential pressure supervenes, the previous arrangement of the strata is broken up and the beds crowded into a structureless mass, the more compact crystalline forms suffering least, the long and slender ones most; while, out of this crushed material, under the necessary conditions of heat and tangential pressure, granite is formed.

The most satisfactory part of Mr. King's work, next to its scientific thoroughness, is the breadth of view which embraces in one field the correlation of such extended forces, and the vigor of grasp with which the author handles so large a subject without allowing himself to be crushed by details. Hitherto every geological report has been a geological itinerary without generalization or arrangement. This volume is much more; it is, indeed, almost a systematic geology in itself, and might be printed in a cheaper form and used as a text-book in the technological schools. Right or wrong in his theories, Mr. King could hardly fail to stimulate his students. Our Government has produced much excellent scientific work, and has gained a high reputation for these publications; but if it has produced anything more creditable than this survey, we have not yet seen it.

Pearls for Young Ladies, from the Later Works of John Ruskin, LL.D. Collected and arranged by Mrs Louisa C. Tuthill. (New York: John Wiley & Sons. 1878.)—Certainly no one would suspect that 'Pearls for Young Ladies,' appropriately tinted blue and gold color, was a collection of extracts, biographical, descriptive, and didactic, from Mr. Ruskin's printed works. Such however it is, and, in spite of a foolish title and a tasteless cover, the book is well worth the perusal of the class for whom it is designed, not because all the sayings are either wise or true, nor because the directions are specially adapted for modern life, but because all of it is illumined, enlightened, irradiated with that rarest of qualities—genuine enthusiasm. There is so much sham enthusiasm, and it is made so profitable to its exhibitor; there is so much fanaticism, and it is so often a powerful and most convenient motor, that those who have a distaste for imitations look dubiously even at the genuine jewel; but so long as Mr. Ruskin lives there will be one person, at least, of English speech who, spite of follies, blunders, and violences such as it is not given to most men to commit, has the divine spark. This book has some biographical sketches of Mr. Ruskin's early youth and his first education, as peculiar as the man himself, and one and another personal experience is dropped in between rules for the choice of books, occupation of time, dress, gardening, and fervent exhortation to high-minded choice and to the reconcilement of obedience and liberty, interspersed with some verses, a few stories, and one or two translations. Any reader who likes the book must get healthful stimulus from it, and we can quite believe that unsympathetic readers might find it highly amusing.

The Nation.

NEW YORK, THURSDAY, JANUARY 30, 1879.

The Week.

ONE of the most wholesome speeches of the session was that delivered in the House on Wednesday week by Mr. Bragg, of Wisconsin. The occasion was a Southern "loyal claim" for supplies furnished the Union Army, and Mr. Bragg improved it to denounce the Southern Claims Commission, on principle, and to express his surprise that these claims should receive the votes of ex-Confederate members. He said he had heard that the South would remain "solid" for the Democratic party only so long as the latter was liberal in making allowances from the National Treasury, and he desired to give notice that the sooner the Southern wing "went over" (on this understanding) the better: its place would be quickly filled from the North, when the Democratic party was seen to be the guardian of the Treasury. The complement of this speech, which caused great excitement among the "brigadiers," was made in the Senate by Senator Hill, of Georgia, who declared his opposition to loyal and disloyal claims alike, and that it was high time the South learned to repair the losses of the war by industry and frugality, and give up dependence on national aid. If they wished to avoid such losses in future, they must avoid war. We probably have not seen the end of these debates, and we need be in no hurry to do so, for they are a good sign. What is meant when a Southern white says he is a Democrat? is a question which has been long calling for an answer.

The Senate has passed the House Refunding Bill without dissent, and the Consular and Diplomatic Bill; and the Naval Appropriation Bill, after Mr. Blaine had wasted a good deal of time in advocating amendments which he saved from defeat by withdrawing, and in dodging Mr. Edmunds's patronizing thrusts at him for his "record" and his great expectations. On Thursday it passed the important bill modifying the existing law of patents; and twice during the week it refused by party votes to take up Mr. Edmunds's uncomfortable resolutions concerning the enforcement of the Amendments. The House has good-naturedly extinguished the bill of Mr. Wright, the Pennsylvania Communist, providing for a Government loan of $500 to every person wishing to avail himself of the Homestead Act; and has debated the bill introduced by Mr. Goode, of Virginia, devoting the proceeds of the sale of public lands to the common schools of the several States in proportion to their illiterate population. It is noticeable that this measure is approved by the "National Educational Association," as one of a series for "strengthening the Bureau of Education"; but it seems a rather costly method compared either with the abolition of the Bureau or the removal of the present incompetent Commissioner. The meeting on Tuesday next, in Washington, of the "Department of Superintendence" of this association looks like an attempt to exercise that sort of "pressure" upon Congress which in its more subtle forms is called lobbying. On Tuesday the House passed peremptorily, by 155 to 72, the unconstitutional bill from the Committee on Labor and Education restricting Chinese immigration to fifteen on any one vessel. Three-fourths of the minority were Republicans, but for a still larger number Presidential considerations outweighed all others, and they voted against "equal rights" with the bulk of the Democrats.

The new Patent Bill, which passed the Senate on Thursday and has gone to the House, is the outgrowth of agitation, originally rather adverse to patents, which was fomented by the Granger interest and by the Western Railroad Association. The Senate Committee gave a great deal of time to the matter, and heard arguments pro and con. from parties interested. While the bill embodies some great improvements in the patent system, it also makes changes about which there will be diversity of opinion. For example, the second section, relating to suits for the infringement of patents, provides that an established license fee, if there be one, shall be the measure of the plaintiff's recovery, and in certain cases gives the court power to fix a license fee, and also gives the court power to award such sum by way of counsel fee and expenses of suit as it shall deem just and reasonable in cases where it is of the opinion that the suit of the plaintiff or the defence of the defendant was vexatious and malicious or the infringement wilful. The same section provides that "no account of savings shall in any case be allowed; and no evidence or account of the defendant's profits shall in any case be admitted, except as to actual profits resulting from making for sale or selling the thing patented or the product thereof." It is held, on the one hand, that this is a fatal blow to the worth of patents, and, on the other, that it ensures the patentee advantages which he has never had before. What the House will do to the measure, except amend it, is of course not to be guessed. A more unfit body to regulate the patent system could hardly be found.

The resolution introduced into the House last week by Mr. Windom, of Minnesota, for enquiry as to the feasibility of securing the emigration of negroes from those parts of the South in which the exercise of their political rights is prevented or hindered to other parts where it is not, overlooked the fact that there has been a great deal of emigration of negroes from one part of the South to another, and that it still goes on, under the influence of economical motives. That is to say, the negroes do move about a great deal in pursuit of cheaper or better land or higher wages, and it is a remarkable fact that to this emigration the States in which there has been most bulldozing—such as Louisiana and Mississippi—have been most attractive, because land can be had in them most readily. The explanation of this is that the great body of the negroes really trouble themselves very little about politics so long as they have fair security for person and property, which they have in as high a degree as the white man all over the South, except about election time. As soon as the election draws near and the candidates and managers appear on the scene, the trouble begins. We have had many enquiries into the political condition of the blacks; but nothing would do so much good just now as an enquiry by a competent commission into their social and economical condition, with the view of ascertaining the progress they are making in acquiring property and education.

The Joint Committee which was appointed to examine the Indian problem, and before which Secretary Schurz appeared, has divided equally, and one-half has made a report recommending the transfer to the War Department. It condemns in the strongest terms the whole of our past management of the Indians; treats President Grant's "peace policy" as a practical acknowledgment that the Indian Bureau was incapable of doing its own business; testifies fully to the zeal and fidelity of the present Secretary of the Interior and Indian Commissioner in trying to reform the Indian Administration, but declares that the accounts given of late of the advance of the Indians in civilization have been grossly exaggerated; denies that any improvement can be looked for, because there is no security for the proper dealing with the Indians at remote posts but the individual fidelity and honor of the agents, which is, under the present system of selecting agents, not sufficient; and prefers military officers on the general ground that they hold office during good behavior and are not appointed or dismissed from partisan motives. The signers give these opinions as the result, in part, of two months spent in the Indian country visiting the posts and tribes.

The flight and massacre of the Cheyenne Indians are a most dis-

creditable as well as deplorable incident. They left their reservation, in the neighborhood of Fort Reno, early in September last, and went northward through Kansas and Nebraska, plundering and burning, and were pursued by the troops, and finally captured. The cause of their flight was enquired into by the Commissioner of Indian Affairs, and he reported that it was not starvation, as the military men allege, for they were unusually well fed, though their coffee, sugar, and tobacco had been withheld according to law, because they refused to work. The Secretary of the Interior therefore, in his report, ascribed their flight to "pure cussedness," and in support of this view pointed to the fact that, while three hundred Cheyennes broke loose, four thousand seven hundred other Cheyennes and Arapahoes remained quiet on the reservation. Anyhow the "cussedness" seems to have gone very deep, for a portion of those captured, forty-nine in all, after long confinement in Fort Robinson, Nebraska, finding they were going to be sent back to the reservation, broke out of the prison, killed some of the guard with arms they had managed to conceal or procure, and were followed and shot down in great part, both men, women, and children. The remainder made their escape in the darkness, took refuge in a gully, were surrounded by the troops, and, refusing to surrender, were nearly all killed or wounded, fighting to the last with ferocious determination. There is no more miserable episode in the miserable history of our Indian administration, and the atrocity of it is deepened by the fact that it occurred while the Army and the Indian Department were fighting over the responsibility for the various Indian troubles. Anything, however radical, even the separation of the Indian children from their parents for education at the East, would be better than a system which, however managed, exposes the Government to the disgrace of these horrors.

The Supreme Court has decided the series of cases arising under the Pacific Railroad laws known as the "five per cent. cases." During Secretary Boutwell's administration of the Treasury Department the policy of withholding from these railroads the half of their earnings for Government transportation, which the law promised should be paid to them as it accrued (the other half being retained as part payment of their subsidy debt), was commenced. The companies brought suit to recover the money so withheld, and obtained judgment; but by stipulation it was agreed that the settlement of the account should be postponed until the Government could bring suit and prosecute the same to a final hearing for five per cent. of the net earnings of the roads from the date of their completion, which the law requires to be paid into the Treasury in further liquidation of the subsidy debt. The questions involved in the decision were: 1st, What constitutes "net earnings," and, 2d, When were the roads completed? The companies contended that net earnings were to be computed upon the sum remaining after deducting operating expenses and interest on all indebtedness, and that their roads were not completed until 1874, although put in operation from the Missouri River to the Sacramento in 1869. The Court decides that "net earnings" within the meaning of the Pacific Railroad acts are all the moneys earned after deducting operating expenses and interest on the first-mortgage bonds, which constitute a lien prior to the Government mortgage; also, that the roads were completed at the time when the companies accepted the last instalment of subsidy bonds, which the law prescribed should be delivered to them on completion. The "Crédit-Mobilier case" having been decided some weeks ago adversely to the Government, there are now no Pacific Railroad cases on the Supreme Court calendar arising under the acts of 1862 and 1864. Among the recent decisions is one declaring that the Government mortgage does not extend over the Denver Pacific Railway, although that road was originally a part of the subsidized Kansas Pacific, and that it covers the Kansas Pacific itself only so far as the subsidy extended—*i.e.*, from the eastern terminus to the 100th meridian of longitude.

The account we gave some time ago of the way in which the campaign telegrams were dealt with by the Republicans has been proved by the evidence taken this week before the Potter Committee to be substantially correct. Mr. Orton managed dexterously to avoid surrendering them to the House Committee, but handed them over bodily to the Senate Committee, of which the late Senator Morton was chairman. While there they were appropriated, in part, by one Bullock, the clerk of the Committee and a protégé of Senator Morton's, who gave them to Congressman Evans, of Indiana, on the eve of his (Bullock's) departure as Consul to Cologne, an appointment which he received about the time the Potter Committee began to be talked of. Evans, in turn, gave them to Brady, the Second Assistant Postmaster-General, also a protégé of Morton's, who examined them and sent some to the *Tribune*, and gave the rest to Mr. W. E. Chandler, who in turn sent some to the *Tribune* and gave the rest to General Butler. Brady was one of the "workers" during the canvass, and spent a month in Florida absent from his duties, "seeing that there was a fair count," to use his own words. The bundles of telegrams that were passed about in this way were, however, all Democratic apparently, and the desire of the witnesses to have them searched for "latent rascality" does not seem to have covered those of their own side, which have apparently been effectually disposed of. Brady testified that he went to the committee-room and sought out and removed his own telegrams from Florida, of course not because there was anything wrong in them, but simply to keep them "as relics." Bullock, our consul at Cologne, fearing this investigation, wrote home in November last begging Evans that his name might not be mentioned in connection with the matter—a singular request from a good man who has been instrumental in bringing villany to light!

We are glad to learn from the Albany *Evening Journal* that the failure of the Legislature since 1875 to reapportion the representation, in obedience to the Constitution, is to be "charged wholly and exclusively" on the Democrats. We felt sure that somehow the Democrats were at the bottom of this as well as other badness. That the Republicans could delay the performance of such an important duty until they got that eminent reformer, Mr. Conkling, back into the Senate has always seemed to us one of those monstrous suppositions which no right-minded man could entertain without wrenching his mental machinery. How the Democratic minority worked this mischief on the majority we do not as yet know, but we presume it was by the use of drugs. As the *Evening Post* points out, however, this year the Republicans will surely be able to do the work. The majority which has re-elected Mr. Conkling must be able to outwit the rascally Democrats this time. Minorities may be wicked and powerful, but a majority seeking earnestly to do its duty is no mean force.

During the month past two expeditions across the Mexican border have contrasted strongly with the incursions from both sides which several times during late years seemed to make war imminent. The first of these was a visit of Major-General Treviño (commanding the district immediately south of the Rio Grande) with his staff to San Antonio and Galveston, at which places the Mexican officers were entertained by General Ord, commanding the military Department of Texas, and by the local authorities and citizens, with such cordiality as to cause them publicly to express their high gratification. What may be considered in order of time as a return visit was arranged in advance, chiefly by enterprising merchants of Chicago, and was directed beyond Treviño's command. On the 16th inst. the excursion party, amounting to a commercial mission, was formally received at the National Palace, in the city of Mexico, by President Diaz, a spacious building placed at its disposal for the display of goods, and its members welcomed with great enthusiasm. Even Minister Foster, whose discouraging letter had been printed and distributed to the excursionists before their journey was completed, seems to have been carried away by the prevailing excitement so far as to promise "his heartiest co-operation." The present Administration in Mexico, as well as some of its predecessors, has been steadily in favor of railroads to connect with the north, not

only because they will facilitate trade, but for increasing military power over the States where international peace was threatened and where rebellion against the central authority was fomented. The advantage of railroads to any government, in the rapid transportation of troops and efficient superintendence, would be the same as is gained by our transcontinental routes through the Indian country. Accordingly, concessions have been liberally granted by successive Administrations, but unfortunately have generally fallen into the hands of mere speculators without capital, who were unable to start the enterprises. When Diaz, after a reasonable delay, abrogated former concessions, the speculators opposed his recognition, and predicted the failure of the new undertakings on the ground that there was no trade for railroads, in spite of the fact that each had in his own prospectus established the certainty of that trade. After the recent favorable arrangement with its English creditors, it is probable that Mexico will soon enjoy a useful system of railroads to connect with, but independent of, those which will be extended from our territory.

It has been an eventful week in Wall Street. The extreme ease of the money market, which has been fostered by Government deposits in the banks of over $50,000,000, not only stimulated the refunding of the public debt, but created the wildest speculation that has been witnessed at the Stock Exchange since 1865, when the volume of irredeemable paper was at flood-tide. The sales of United States 4 per cents amounted, during the week, to nearly $50,000,000, and $40,000,000 more 5-20s of 1867 were notified for redemption, making the total so notified this month $150,000,000. Railroad bonds and investment shares were eagerly sought, and advanced from 1 to 4 per cent. The speculation in shares was rampant, and the leading "fancies" were advanced from 3 to 12 per cent. Naturally enough, after so great and rapid a rise there was a collapse, and this came on Tuesday, when about one-half of this rise was lost, although subsequently a good share of the loss was recovered. In London money was very easy, but at times there were disquieting rumors of impending failures. About $10,000,000 of United States 4 per cent. bonds were sold there during the week by the syndicate of bankers made up of the European members of the old 4½ per cent. bond syndicate. The market here for sterling was weak and declined to fully 3 points below that at which specie can be exported, although at the close of the week this market was steady. Silver bullion in London advanced to 51*d.* per oz., but at this price encountered large sales by the German Government, after which the price fell to 50⅝*d.* to 50½*d.* The bullion value here of the 412½-grain silver dollar at the close was $0.8507. The enactment of the Pension Bill, which the President has signed, makes an outlet for the $30,557,000 silver dollars, and bullion in process of conversion into dollars, now in the Treasury; as well as for the $10,000,000 legal-tender notes held as a special fund for the redemption of fractional notes which have, without doubt, been lost or worn out, and which will never be presented. Why Congress should have passed, or Mr. Hayes should have signed, such a bill, which is now estimated to involve an outlay of $80,000,000, must seem incomprehensible to those who do not reflect on the inconvenience to parties and politicians and platform-makers which opposition to such a measure would entail.

Eight months have now elapsed since the conclusion of the Anglo-Turkish Convention by which the Sultan agreed to reform Asia Minor, under the superintendence of Great Britain. There have been various reports since then of the progress made, but there has been no authentic information about it until a correspondence between Lord Salisbury and Sir Henry Layard on the subject was published a fortnight ago in London. The correspondence began in August last and closed on the 4th of December. It shows that not only has no reform of any kind been effected, but that the prospect of any is very blue. Lord Salisbury asked Sir H. Layard to procure the organization of a gendarmerie in the Asiatic provinces, commanded by Europeans; the establishment of a court of appeals in each of the five important towns, to contain one European member with a veto power on decisions; the abolition of tithe-farming and tenure during good behavior for judges and revenue collectors. Sir Henry got an answer to all this in October, and in forwarding it says that nobody connected with the Turkish Government, except the Sultan and Safvet Pasha, wanted to entertain the matter at all; but at last the Sultan declared that he would like a gendarmerie such as described, with *some* foreign officers, and he would "draw up a law" about it; that he would also like good courts, and would be glad to have "the experience and knowledge of European legists" in organizing them, but did not see how he was to give Europeans seats in the tribunal; that he would also give the new system of taxation a trial, by establishing it first in one or two districts, so as to see how it worked (the pretence here, that its superiority to the present system would have to be ascertained by experiment, is very diverting); that he would give judges and collectors tenure during good behavior, subject to the condition that they might be dismissed "if their dismissal was recognized by the Imperial Government as indispensable for some great public interest."

This was not very satisfactory, of course, to Lord Salisbury, and some further correspondence followed, but Sir Henry brought it to a close by showing that, as a matter of fact, the Porte had no money either for the gendarmerie or for the courts; that the utmost it could afford to do was to establish tenure of office during good behavior, as this would cost nothing, and try the new system of taxation in some small district, and with this Lord Salisbury has to be content. The acknowledgments that both of them make in the despatches, about the Turkish Government and the governing capacity of the Turks are an amusing commentary on the Conservative view of the Turkish Empire as propounded in Parliament. Since the correspondence closed, however, a change of Ministry has occurred, which makes things look somewhat more hopeful; Khaireddin Pasha, of Circassian origin, who has held important offices under the Bey of Tunis and has shown remarkable capacity and cultivation, having been made Vizier, or Prime Minister, much to the disgust of the palace ring, who detest him as an interloper. It remains to be seen whether they will not oust him eventually. Safvet Pasha, whose place he took, has apparently tried to do so and failed; at all events, this is the construction put on the appointment of Safvet as Minister to Paris. Khaireddin, though a good Mussulman, is what we should call here a loose constructionist of the Koran, and sees no objection to appointing Christians to any office of the state. He has accordingly scandalized the orthodox world by making M. Caratheodori, a Greek, Minister of Foreign Affairs. The rock on which he will probably split is the finances, which grow worse and worse. The Turks are trying to get England to guarantee a loan of £20,000,000, partly to keep up the paper money and partly to restore the administrative machine, which the war has utterly wrecked. The accounts from Asia Minor describe something very like a dissolution of society.

A fresh crisis has arisen in France on account of the decision of Marshal MacMahon not to sign the decree making changes in the great military commands, and to resign if no alternative is left him. Simultaneously, the apparent determination of the Left to proceed to the impeachment of the Ministry of the 16th of May threatens to dissolve the present Ministry, and Gambetta is represented as fully bent on taking his revenge in this way for the late vote of confidence. Gen. Chanzy and Admiral de Pothuau are spoken of as probable successors to the Marshal, with whom, it must be confessed, the chances of compromise seem much poorer than they were when the De Broglie policy was in question. The Republican majority in the two Chambers is a guaranty that the public order will not suffer from the temporary lack of an executive, but the expectations of the future moderation of the Republic are likely to be greatly modified both in the rest of Europe and in France.

REFORM WITHIN THE PARTY.

THERE are probably some among us still who can recall the facts connected with an extensive political revolt in this country, raised ostensibly in behalf of Reform, and having for its object nothing less than the seizure of the highest places in the Government by persons calling themselves Reformers. It was alleged that the party in power, under pretence of looking after the interests of the negro, had become mainly an instrument of private pelf, that it had lost all respect for the Ten Commandments, that its only standard of morality was success, and that the surest avenue of success lay through some unguarded approach to the public treasury. It was contended that these evil practices had become chronic through long neglect, so that ordinary remedial agencies taken internally would have no effect to remove them. In the estimation of the so-called Reformers nothing short of prompt surgical treatment would avail to effect a cure.

The impartial historian is bound to record that the party thus assailed made few and feeble attempts to deny the allegations of the self-styled Reformers. Here and there a particularly brazen politician, who had been caught with cream on his whiskers, was heard to deny that any milk had been stolen at all. For the most part, evils were acknowledged to exist serious enough to engage the most earnest attention, and as an offset and general answer to the cry of Reform there was raised the opposing cry of Reform within the Party. It was held by the advocates of Reform within the Party—that is, by all except the limited number who denied that any Reform was necessary—that it was unphilosophical to resort to extreme measures without first trying more moderate remedies, and that the party contained within itself in a dormant state all the elements of Reform, which needed only to be set to work by familiar chemical agencies, as it were, in order to produce the desired results. How much better would this be than to kill the patient outright by way of restoring him to sound health! The promise of Reform within the Party had an alluring sound. By declaring in the platform of the year that "any system of civil service under which the subordinate positions of the Government are considered rewards for mere party zeal is fatally demoralizing," the revolt was considerably checked, but it will always remain a matter of doubt whether the opposing faction would not have carried the country, had they not taken for their leader a person so noted for his eccentricities that the majority preferred to postpone Reform a while longer rather than commit it to the hands of so jerky and wayward a practitioner.

Reform was postponed, and Reform within the Party had its own way during the space of four years, at the end of which time it appeared that the people did not like it and were determined to have a change. Reform within the Party was roused to fresh activity by the evidences of this intention, and actually prevailed so far as to choose a leader who, if he did not represent Reform, did not represent the opposite. The people voted by 250,000 majority for a change of an altogether different kind, but they somehow failed to bring it about constitutionally. Reform within the Party again had a chance to show what it could do. The earliest symptoms manifested were those of decided repugnance in the party to reform of any kind, and the impartial historian will be obliged to record the fact that, although President Hayes has done much in a negative way to restore the party to popular favor by abstaining from the bad practices which had previously brought it into disfavor, he has obtained no thanks, but on the contrary every possible mark of ill-will, for his pains. A more striking sign and definition, however, of the progress of Reform within the Party is manifested in recent elections of United States Senators in New York, Pennsylvania, Illinois, and Wisconsin. The gravamen of the charge brought against the party when the ancient revolt took place was, that certain men occupying the highest places in its councils, and banded together like a college of Jesuits, had not merely got control of "the machine" but were using it for dangerous and corrupt purposes, so that the only way to shake them loose was to break "the machine" itself. Probably the most temperate and cautious Reformer of the remote epoch referred to would have said that his objection to these men and their system was that no act of maladministration and no scandal in public life had ever met with discouragement at their hands if committed by one of their own set (that is, by a component part of "the machine"), if concealment of it were possible, and hence that Reform within the Party was not to be expected through them, but the contrary.

The men most obnoxious to this criticism were undoubtedly Senators Conkling, Cameron, Logan, Carpenter, and Chandler. In one way and another all of them, except Conkling, were retired to private life. Cameron resigned, and Logan, Carpenter, and Chandler were disposed of by political throes such as come only on rare occasions when something particularly offensive has to be sloughed off the body politic. "The machine" made desperate efforts to save them, but to no purpose. They were each and all immolated on the altar of Reform within the Party. In the case of each there was a minority, a fraction, in the councils of the party determined that these men, at all events, should not go back to Washington to represent their respective States in the Senate. Even these fractions have now disappeared.

In the election of Mr. Logan the case is aggravated by the fact that the present incumbent of the seat is a man of a decidedly higher type of character, and of at least equal ability in the handling of subjects which ought to engage a Senator's attention. He is now serving his first term in the Senate, and, according to party usage, ought to have been re-elected if the Republicans were in the majority in the State Legislature. His only deficiency appears to be a lack of activity in the work of distributing the subordinate positions of the Government as rewards for mere party zeal—that is, in contravening the officially promulgated doctrines of Reform within the Party. In Wisconsin Mr. Carpenter's only rivals were the postmaster of Madison and the present incumbent, Senator Howe, each of whom has acquired something like a national reputation as a vigorous and untiring opponent of Reform either in or out of the Party. Mr. Carpenter's success over such antagonists is perhaps not to be attributed to a lower moral tone than anybody else in his State could boast of—the bolters who defeated him four years ago complained that he had boasted publicly of his share in the "back-pay grab"—but rather to his more clever and jocose way of defending practices which commonly excite prejudice in the public mind and lead to demands for Reform within the Party. In the neighboring State of Michigan also it appears that the revolution is moving backward too rapidly to wait for the ordinary course of Senatorial elections, so that Mr. Christiancy, who has proved one of the ablest and most useful members of the body to which he belongs, must needs be retired on a foreign mission or a seat on some judicial bench in order to give place once more to "Zach" Chandler.

All this is logical enough, and even necessary, if the party is making ready for the renomination of General Grant. To bring in another era of Robesons, Belknaps, Delanos, and Shepherds with any *éclat*, the presence of Conkling, Carpenter, Chandler, and Logan in the Senate is of vital importance; for since, by a perverse chain of circumstances, the Democrats have become the more numerous half of that body, the President ought *à fortiori* to be supported by men who have given proofs that they understand his methods and approve his conclusions. The thing most to be deplored, from this point of view, is the absence of a number of strenuous defenders of equal rights in the South. Patterson, Conover, Spencer, and Dorsey have very nearly ended their public careers, having fallen victims to Reform outside of the party, and having arranged to settle in places so far removed from their late constituents that their return to the Senate is not to be looked for. In default of the unflinching support which they brought to the last Administration, it is indispensable that the States of Illinois, Pennsylvania, Michigan, and Wisconsin should stand firmly by the next one. As to the present one, it represents nothing but Reform within the Party, and deserves no support from anybody.

MALDEN PUBLIC LIBRARY

CONGRESS AND INTER-STATE COMMERCE.

THE Reagan Anti-Discrimination Bill is now before the Senate. The fact that a measure of this description has been able to make its way through the Lower House of Congress is indicative of a tendency which may effect radical changes in the relations of American railways to each other and to the community. It is one of the most momentous steps ever contemplated by the National Government, and will be found to involve far more than the provisions of the bill itself; for if Congress has the power to legislate on the subject of transportation at all, it may in the future interfere to a much greater degree than is now proposed. There has not been as yet any serious question of its Constitutional right to enact regulations of some sort which shall govern each important public factor concerned in foreign and inter-State commerce; but serious doubts exist as to whether Congressional supervision of railways might not lead to many new evils, worse in their effects than those which it is now sought through this means to cure.

We have not seen any formulated statement of the troubles which the proposed legislation is expected to remove, and probably none has been prepared. It is, however, well understood that a very intense feeling of dissatisfaction with railways pervades nearly all parts of the country. The causes for this bitterness, so far as they have been made public, are not the same everywhere, but the feeling in all localities differs rather in degree than in kind. Its most formidable manifestations until now have been the railway strikes and riots of 1877, and the rash and ill-considered Granger legislation of some years since. These were ugly symptoms, and to any careful observer were sure evidences of social disease, which, if not cured or ameliorated, would certainly again reveal itself in other and perhaps more destructive ways; but it has been and is extremely difficult to define the nature of the sickness, and hence almost impossible to secure any agreement upon suitable remedies.

Before judging whether Congress can be safely looked to for help, it would seem but prudent to have the whole subject laid bare; to expose to public view and to public discussion the railway customs which have irritated such multitudes into a craving for relief so imperative as to override their customary reverence for law. Conservative people deprecate present legislation further than to provide for intelligent investigation by a committee of carefully selected experts, under due national authority. In truth, however, actual legislative regulation, up to a certain point, is an essential preliminary to successful investigation. Congress must go so far as inflexibly to require absolute and continual publicity upon the part of railways, in all matters which concern their relations with the general public, before any certain knowledge can be gained, even through experts, of what is actually done in the way of discriminations. Plausible reasons can be urged against such publicity: It will be a revelation of policy to rivals, which is rarely a wise candor. The time requisite to make and announce tariff changes may and often will drive trade into channels which can act more promptly. But neither these reasons nor any others that can be produced against enforced publicity can, in our judgment, compare in strength or weight with the arguments in its favor. The secrecy which now veils all important railway business may almost be deemed the actual parent of most objectionable railway practices, so powerful are the opportunities for and temptations to folly, and worse than folly, permitted by its virtually impenetrable shelter.

Perhaps as glaring an evil as any which it stimulates is that disastrous exaggeration of wholesome competition known as a "Railroad War." All evils are but variations from a just middle course, wise in itself and good in its effects. Competition, within proper limits, is such a middle course. Monopoly is one evil extreme, and a mad commercial contest (not yet provided with a single distinctive name) is the other. Either extreme is full of harm to any community. As between the railway anarchy which has worked so much commercial injury for many years and the risks of a monopoly through combination, such students of the subject as Adams and Fink unhesitatingly prefer the latter; and they are undoubtedly right. If no better way can be found, we should welcome combination as at least promising a mitigation of some of the worst of our evils.

To persons familiar with railway history there is something monstrous in the daily effects of secrecy. A typical instance will better illustrate this than pages of description. The chief commercial officer of a railway, whatever his title, soon learns that his leading duty is to watch and outwit unscrupulous competitors. Perhaps a million bushels of wheat are to be moved from Chicago to New York. A convention of competitors (just adjourned) has resolved upon new rates, which are to be "firm" by all of their routes; but shipping is slack, empty cars are accumulating in the Chicago yards, and the shipper is wiser in his generation than railway officials. He calls on the agent of one of the roads, announces the magnitude of his proposed shipment, looks at the new rate and returns it with a gentle sneer, which is weighty with unexpressed pity for the innocent faith of his listener. "Your road is my choice, Billy, and on an even keel you shall always have my trade; but the fact is I can do better. Don't ask any questions; I can't answer them. It's not my interest to give away my friends." "Billy" is disturbed. He is not sure whether the shipper is lying or really has been offered a "cut"; but he is quite sure that "Tom," who solicits for the Fort Wayne, or "Joe," who is agent for the Blue Line, will "scoop this big lot" if he does not. At a critical moment like this, "Billy" sees with wonderful clearness how faulty is the organization of his company, which leaves him stranded, as it were, for lack of power to act instantly and on his own judgment alone. What weight have such considerations as conventions, agreements, policies, or even net earnings, on "Billy's" mind at such a crisis? None whatever. He even forgets that his road has just emerged from a six months' desperate struggle, stripped of much profit and staggering toward bankruptcy. It is nothing to him that his president has, through tribulation and unsavory concessions, helped frame, as a peace treaty among the recent foes, this agreement on which the ink of the signatures is not yet dry. He only feels the imminence of that danger which, as soliciting agent, it is his specific function to avert. He begs the shipper for an hour's grace, and telegraphs his general manager (one of the signers of the agreement) that Jones has two thousand car-loads to ship, and has been offered a "cut," but will not say how much or by whom. He testifies earnestly to the veracity of Jones, though he has frequently known him to lie to gain a trifle.

The manager has no trust in the sanctity of the agreement or the good faith of its signers. Previous experience and his own practices have destroyed all such faith. Two thousand cars are a huge lot for dull times. The coveted authority is presently given, with strenuous injunctions to guard against the matter "getting out." "Billy" pledges the shipper to a willing privacy, grants the "cut," and, with a deftness only gained by long practice, arranges all the details of its payment, so that if suspicion and accusations arise, the charge can be denied with literal truth. The regular public rates will be collected, and all the freight records will accord with the agreement; but perhaps twenty per centum of the weight in each car will be omitted from the manifest, or five cents per hundred will be allowed as back charges, or paid for some ostensible service never rendered; or possibly payment may be deferred till the rival railways shall have made their charges, and, after receiving an indignant plea of not guilty, dropped them for lack of proof. But the cheated roads are too clearly aware that the denial is only Pickwickian, and take the earliest chance to "get even" with their neighbor. Within a fortnight from its execution the agreement, obtained with so much difficulty, is as useless as a last year's almanac. The result of one such act, at the instance of a local agent, zealous, according to his light, for the interest of his company, has frequently cost the railways affected a round million of dollars without producing any offsetting good to the community. Enforced publicity in tariffs would go far towards making such calamitous actions impracticable.

It may be asked why under such circumstances the conservative and restraining power of railway directors and shareholders is dormant. Unfortunately, while they have power they lack knowledge. Few shareholders could judge such a case intelligently if spread fully before them; but this class of actions are seldom submitted even to directors. It is not extravagant to say that the chief commercial officer of any large American railway can make in any month a difference of from one to three hundred thousand dollars between the actual earnings and the earnings as they would have been at the rates avowedly charged; and can do this without the knowledge of any one but the chief accounting officer, to whom his order is commonly law. In the main it is probable that secret concessions are honestly made, and solely with a view to the best interests of the railway. It may also be fairly granted that so long as any carrier retains the power to and does give them, it will be frequently essential that rival carriers should meet such action by imitation. But the uncontrolled power to make concessions is a fearful possession, even when resting in honest and capable hands, and full of dangerous temptations to any venal or weak-principled custodian. If a shipper can induce such an officer to let his real car-load of lumber be thirty thousand pounds, and the weight charged for but twenty thousand, he can afford to share his illicit gains with the obliging official. If trade is heavy, such perquisites to the latter would soon exceed his moderate salary. Should his conscience balk at a direct division of the spoils, some speculation in lumber is easily devised, the fortunate issue of which the prudent shipper takes good care shall be well assured to his thrifty patron.

To the shareholders in railways full publicity is the only basis for sure protection against such designed or blundering spoliation. To directors who conscientiously haggle over a few dollars uselessly spent on the equipment of an office, and who honestly strive to guard faithfully the interests entrusted to them, publicity is the only potential check to these vast flows from the bunghole which they helplessly and, in the main, ignorantly permit. To the community, who feel the oppression of favoritism and discrimination, absolute publicity is essential, in order that from a knowledge of what discriminations are actually made a reasonable judgment may be formed of what can safely be permitted. If the bill now pending should result in a law which, through effective provisions and penalties, ensured the destruction of every form of secrecy in relation to railway compensation for every kind of service, it would confer benefits upon the country far beyond the power of any one now to estimate.

THE NATIONAL LIBRARY'S EXHIBITION.

PARIS, January 10, 1879.

THERE is something very natural in our tendency to hide our treasures; it requires an effort to bring them to the light. During the last great Exposition of 1878 the National Library—the largest library in the world with the exception of the British Museum—made this effort. For weeks, I might say months, when I was on my way to the reserved Manuscripts Department, I saw workmen in the great and magnificent gallery still called after Mazarin, that leads to the secluded corners where lie so many thousands of undisturbed manuscripts. I asked them what they were doing; they told me that the Library was preparing its Exhibition. Day after day I saw the work done; it was hardly achieved before the Exposition was close to its end, and as there was no advertising in the newspapers nor any mention of the Exhibition in the press, I suppose very few foreigners had the opportunity of seeing what may be called the gems of our finest library. Fortunately the Exhibition of the Rue Richelieu will survive its object; it has produced such an effect on the chosen public of the bibliophiles that it will become permanent; and I have no doubt that it will soon be as well known as the Musée de Cluny or the Galerie d'Apollon at the Louvre. Every lover of books, of manuscripts, of fine bindings, will make a pilgrimage to the place which has been so admirably arranged by M. Delisle, the eminent Director of our National Library.

I think that this Exhibition will be of great utility to many countries. Take America, for instance: I doubt if there is a country in the world where the pleasures of literature are more universally valued than in the United States, and where money would be more cheerfully spent for fine books. I have before me some books edited and printed in America which can support comparison with the finest books made in Europe, for the quality of the paper, the character of the types, and some of them for the beauty of the illustrations. But it always seemed to me that the Americans, who have studied the art of printing so well, have not concerned themselves enough with the art of binding. I have received from America some beautiful books which were very badly bound. The margins were almost cut away, instead of remaining as large as possible; the backs and the sides were covered with the most commonplace and wholesale sort of *fleurons*. I will not and cannot here enter into a study of the technical art of binding. I have often followed all its processes in the rooms of Trautz, of Thibaron, who are now our best binders. I can only say that binding is a most difficult art, and that a good binding is worthy to be called a work of art. I do not think that Trautz ever made the same binding twice; there is in every book coming out of his hands something personal, something original. This man, who could make any amount of money by merely putting his name on books, is so conscientious that he only turns out every year about two hundred volumes; he has only three workmen or workwomen; he does all the drawing of ornaments and gilding himself. For those who have not seen such men as Trautz or Thibaron (the pupil of Trautz) at work, it is almost impossible to imagine how much pains must be taken for one volume. But let them go to our Exhibition in the Rue Richelieu, and before the wonderful books of the sixteenth, seventeenth, and eighteenth centuries, which have been fortunately preserved by our kings or by our great bibliophiles, they will see how a fine book, well bound, can become a sort of monument of the past—how it can be made to express its character, its tendencies, its ideal.

The bindings of the sixteenth century are in perfect harmony with the art of the Renaissance, with the originality and the splendor of the court of the Valois. The bindings of the seventeenth century have all the pomp, the majesty, the solidity of the art of the "grand roi"; they are serious, as well as rich; they belong truly to the time of Bossuet, of Corneille, of Pascal. You can even make categories in the same time. You can put aside in the seventeenth century the books of the Jansenists; they constitute a class which has kept to this time the name of "les Messieurs de Port-Royal," as they used to be called. When I say to my binder, "You will give to this book a Jansenist binding," he knows at once what I mean – a severe binding, without any glittering of gold, without any ornament; a mere piece of very good and solid morocco. We see in the transformation of the art of binding from the seventeenth to the eighteenth century the exact counterpart of the transformation which took place in the furniture, in the decoration of apartments, in the dress: severity gives way to grace; we enter into what the French call the *rococo* style; a binding is a sort of jewel, adorned with the most lavish amount of gold, and with mosaics of many colors, made out of various morocco. This eminently French art of painting was lost in the Revolution, with so many other things, like the art of engraving, which had been carried to perfection at the time of Moreau le jeune, of Eisen, of Gravelot, of Cochin. I doubt if you could find anything more ugly than the books bound for Napoleon I., for Louis XVIII., for Louis Philippe. The revival of the art has only taken place within twenty years, and it is partly due to the few bibliophiles who kept the tradition of the old times, and partly to our binder Trautz, a German by birth, but who had learned early to appreciate the character of the French bindings. Now we have in Paris quite a school of men who have been walking in the footsteps of Trautz; very able men, and very admirable workmen, but alas! they have not yet created what may be called a style. They merely attempt to reproduce and to combine the features of the old styles of the sixteenth, seventeenth, and eighteenth centuries. But even in this sterility of invention, as well as in this curious capacity for imitation, for adaptation and combination, they prove again that all the forms of art, the humblest as well as the highest, are mere translations of the general thoughts of humanity. The architecture of our new houses and palaces has no style; why should our modest bookbinders be more inventive than our architects?

I have been, perhaps, led away too far from the Exhibition in the Rue Richelieu. In the first room, which precedes the great Mazarin Gallery, are to be seen the choicest specimens of binding which the National Library possesses. Quite by themselves are shown the bindings of Grolier. Jean Grolier was Treasurer of France; he was born in Lyons in 1479, and died in Paris in October, 1565. Most of his books wear the amiable designation, "Grolieri et amicorum"; and it was not a vain

word, as Grolier had generally several copies of each book—a proof that he lent them to his friends to read. It has been remarked that he never had two books bound alike; they are all in the same style, with very beautiful designs of great simplicity and nobility, more remarkable for invention, for curious combinations of lines and forms, than for mere splendor of gold and of color. M. Leroux de Lincy has written on Grolier a volume full of erudition, in which you may find the most complete list of the volumes of his library which have been traced thus far. I have seen, however, in the Exhibition of Art which took place on the Trocadéro a few volumes of Grolier's which are not on M. Leroux de Lincy's list. Grolier often had also on his books the motto, "Portio mea Domine sit in terra viventium," taken from the Psalms of David (Psalm cxli.) The National Library exhibits as many as fifty-two Groliers, and it has a good many more.

To the same period and somewhat to the same style are to be ascribed the books of the famous Constable of Montmorency. These books are exceedingly rare. It is curious to find among the great bibliophiles the rude and hard Constable, of whom people used to say: "Dieu nous garde des patenôtres de Monsieur le Connétable," as he used to mutter a paternoster between his teeth each time he ordered a man to be hung. The great motto of the Montmorency was "Aplanôs" (without varying); his arms bear the famous *alérions*, and his bindings always bear the great sword of the Constable of France. Montmorency was the owner of the Château of Écouen, now the property of the state, and of Chantilly, which fell into the hands of the Condé family after the execution of the last Montmorency under Louis XIII. Our library is rich in books of Maioli. These books often bear "Thomæ Maioli et amicorum" and the motto "Inimici mei mea michi non me michi." You will understand at once that *michi* stands for *mihi*. Sometimes this singularly obscure motto is replaced by "Ingratis servire nefas," which is too easily understood. The bibliophiles have a great regard for the books of Marc Laurin, who was Lord of Watervliet; his motto was "Virtus in arduo."

After these great names, which are, so to speak, the holy names of the worshippers of books, comes our great Jacques Auguste de Thou, who was so fortunate as to have his books bound by the great artist Nicholas Eve. The history of the Eve family has yet to be written; as many as three of them are known with certainty—Nicholas the first, Clovis, and Nicholas the second. They all were binders to the king; the first Nicholas worked for the sons of Henri II., for Henri III.; he followed the curious fancies of his sovereign, who always ordered the marks of the crucifixion to be put on his books—death's heads, the sponge, the lance of Calvary, the cross, with the motto "Spes mea Deus"; no emblems of royalty, no crown, and often no *fleurs de lis*. Nicholas Eve worked also for the famous Margaret of Valois, the daughter of Henri II. and the first wife of Henri IV. She had adopted, naturally, the *marguerite* (daisy) as her flower, and in the admirable bindings of Eve you will see the *marguerite* in every stage of development, together with all sorts of emblematic letters or figures—the sun, with its rays imitating the petals of the *marguerite*, the snail (I could never understand the sense of this emblem), etc. The modest binder for Henri III. and Margaret never signed any of these books with his name, as the meanest binder does now, but they have on them the mark of a real genius. The National Library is naturally very rich in books of our kings. Their beauty is really incredible; nothing can equal the fine books of Francis I., with their emblematic salamander, the bindings in mosaics of Henri II. and of Diane de Poitiers. These volumes can be placed among the greatest works of art of the Renaissance; they excel by far anything of the kind that was ever made in Italy. It is quite true that the impulse came from Italy, from Venice chiefly, through Lyons; but our artists gave to the new art a perfection which could not be surpassed. As the printing of Lyons and Paris soon surpassed in excellence the printing of Italy, the decoration of our books soon threw in the shade what was achieved in Venice or in Rome.

After you have examined all the royal books from the time of Louis XII. to the time of Marie Antoinette, you enter the great Mazarin Gallery, which is full of the most valuable works, of xylographic impressions, of the first books printed by Gutenberg and Fust, by Pfister at Bamberg, by Fust and Schöffer, of the curious books printed first at Strasbourg, of the first books printed in Italy, in Spain, in Bohemia, in Holland, in England, in Switzerland, in Denmark. Of course, the early imprints of Paris are well represented, as well as the earliest books of the various cities of France. In the same gallery are to be found the choicest illuminated manuscripts of the library; but these are so important that they would require a special description.

Correspondence.

KANSAS CITY.

To the Editor of The Nation:

Sir: Your valuable journal (issue of Jan. 19, 1879, p. 39), while justly and severely condemning Jackson County and Kaw Township, inadvertently does injustice to the City of Kansas.

The city covers territorially a part of Kaw Township, and the latter a part of Jackson County. All three are in Missouri, not in Kansas, as your article, by a slip, indicates. The affairs of the county and township, including the raising of money by taxation and the payment of bonds and coupons issued on behalf of each, are managed exclusively by a set of officers for the whole county, called a county court. You charge truly: "Jackson County and Kaw Township are both shameless defaulters." That *court* is, however, alone chargeable for this, and the city should not be censured nor punished for sins it is not guilty of.

The city is a separate corporation, electing its own officers, who are empowered to levy and collect taxes, and charged with the duty of paying its bonds and coupons. This has all been faithfully done, at least for the last four years, during which the present city charter has been in force, and will be hereafter. If the city could dictate the financial policy of the county and township the reproach against them would soon be wiped out. But this it cannot do. It is in bad company and must suffer some. It will do no good to punish it by repealing the $200,000 appropriation made by Congress for a custom-house and post-office for it. Doing so will only weaken the hands of those who in the past have had the city perform its promises to pay, and who propose that in the future it shall preserve its honor by paying its bonds. If the repeal of the appropriation for the reason you suggest, default of the county and township in payment of bonds, would be felt only outside of the city, it might do good—at least would be merited. But the repeal would injure the city very much the most, and maybe give much more satisfaction in parts of the county outside the city than to the unfortunate holders of county and township bonds.

The credit of the city is good. Its renewal bonds, issued during the last four years, have sold well. Capitalists knowing all the facts, and that county and township are both "shameless defaulters," have been glad to get them. One fact on which investors rely is that the present city charter, among other wise things, provides:

"Neither the Common Council nor any officer of the city shall have authority to make any contract or do any act binding the City of Kansas, or imposing upon said city any liability to pay money, until a definite amount of money shall first have been appropriated for the liquidation of all pecuniary liability of said city under said contract, or in consequence of any such act; said contract or action to be *ab initio* null and void as to the city for any other or further liability."

Under this charter the city four years ago began doing, and has since done, an exclusively cash business. It has found in the simple rule, Pay as you go, a specific for much of the evil so often inhering in municipal administration, and which afflicted it before it was governed as now.

Cash.

OUR SOUTH AMERICAN TRADE.

To the Editor of The Nation:

Sir: A letter signed "B.," in the *Nation* for January 9, criticises the proposition of Mr. Evarts to subsidize lines of mail steamers between the United States and South America, suggests that this plan would not have the desired effect of building up our trade with that country, and takes the view that our tariff is alone responsible for the smallness of that trade.

It seems to me that your correspondent "B.," like many other persons who entertain decided views upon the tariff question, is partly right and partly wrong; also, that his letter is a striking illustration of the fact that we are very apt to ignore facts in examining a favorite theory, and frequently carry arguments further than the facts will justify. As a merchant who has had some practical experience in endeavoring to do business with South America, both before and since the establishment of steam communication, I know that the principal obstacle to the development of trade with Brazil has heretofore been the lack of *regular* and *frequent* steam communication. The principal product of Brazil—coffee—is free of duty in the United States, and we import very largely of that staple, buying from Brazil four or five hundred per cent. more than she buys from us in return; and the principal reason why the

merchants in Brazil obtain their supplies from Europe is that they have very frequent steam communication and low rates of freight. These steam lines could not have been established had it not been for the liberal compensation for mail service which England and France gave at their inception, and continued until sufficient business had been developed to sustain these lines without such aid, a portion of which is still continued.

In the course of Brazilian trade we have a striking illustration of the correctness of the position taken by Mr. Evarts; but Buenos Ayres and the west coast of South America trade almost as strongly sustains the tariff argument of your correspondent "B." Two of the principal products of these countries are wool and copper, both of which are enormously taxed by our present tariff for the supposed benefit of our wool-growing and copper-mining interests. Hence, these South American products go principally to Europe, and the merchants of those countries would buy the bulk of their supplies there even if they had regular steam communication with the United States.

Still this does not prove that proper compensation should not be given for ocean mail service. If the argument that only postage should be given to carriers of the mails is to prevail, it would break up nine-tenths of the mail routes in our Western States and Territories; and those who argue against subsidies to steamship lines, to be consistent, should also oppose the giving of mail contracts to stage-coach, steamboat, and railroad mail routes in our sparsely-settled States and Territories.

Divesting this question of all tariff, currency, and other sophistries we must come down to the plain, business principle that, if we would compete for the trade of a certain country or locality, we must furnish equal facilities with other nations who are also catering for this trade; and it seems to me that we have got to have both a reduction of the enormous duty imposed upon some articles in our tariff list and lines of American steamers for quick communication; and, to my mind, the latter is decidedly the more important of the two requisites.

I recently had a practical illustration of the important bearing which transportation has upon business. Two retail grocers were competing for the trade of a certain outlying suburb, the people of which had for a long time, without solicitation from either grocer, purchased their supplies at whichever store they chose and taken them home the best way they could. One of the grocers conceived the idea of putting on a wagon, with a smart driver to solicit orders and deliver goods. As a natural consequence he soon absorbed a large part of the trade of the suburb, and his competitor found himself obliged to do the same thing in order to retain his portion of the trade. There is a strong analogy between this case and the present situation of the United States in regard to South American and other foreign markets. England, France, Spain, Italy, Holland, and other countries of minor commercial importance have all been sending out their steam messengers to the four quarters of the globe to solicit orders and deliver goods, while we in the United States have been attributing the paucity of our foreign orders principally to one cause, and, in my opinion, not the chief one.

The liberality with which we gave public lands and other subsidies to railroad enterprises occasioned a reaction in the public mind which was intensified by the revelation of the corrupt practices of the Crédit Mobilier and also of the Pacific Mail Steamship Company, under the Stockwell management, until "Anti-subsidy!" became a popular political war-cry and has been echoed and re-echoed in the conventions of both parties, to the very great detriment of our export trade. A fraudulent insurance company does not prove that insurance, as a system, is all bad, nor an abuse in savings-bank management that there should be no savings-banks. If there have been abuses in granting subsidies, as there undoubtedly have been, let us guard against them in the future; if certain articles in our tariff are unduly protected, let us reduce the duties, but do not let us proceed in either case to an opposite extreme, which would be unwise and unprofitable. F. B. Thurber.

New York, January 20, 1879.

SHALL WE HAVE A SECRET BALLOT?

To the Editor of The Nation:

Sir: During the recent municipal election in Boston, and to a far greater degree during the late gubernatorial election in Massachusetts, the privacy of the individual ballot was destroyed by the provision of colored ballots or tickets. This practice has been common in Massachusetts elections before, but perhaps never to such an extent as during the present year. During the State election it was a common spectacle to see the zealous committee-men of both sides sitting at the polls, with copies of the registration lists, checking off each voter's name as he voted with a red or black check, according as he voted a Republican or Opposition ticket, the committee-men being able to tell with certainty which way each man voted from the label, portrait, or color which distinguished his ticket. In the manufacturing districts it is reported that mill-owners had clerks stationed at the polls to keep tally of the way the employés voted, in the same way, and informed the employés that the tenure of their employment would depend on the way they voted as shown by the tally.

A few individuals were thus able to control the vote of a large population. To prevent the possibility of mistake, many Republican and other committees printed a certificate on the back of the ticket, of which the following is a sample:

"Cambridge, Nov. 5, 1878.
"This is the only genuine Republican ticket.
"Leander M. Hannum,
"Chairman Republican City Committee.
"Benjamin Dow, Secretary."

It was impossible to fold a bright yellow ticket with a red border, after the fashion of wall-paper, and a heliotype portrait of the "Favorite Son" surmounting the whole, and such a certificate spread at large on the back in the lithographed handwriting of the committee-man, in such a way as to make it a secret ballot. There was no escape for the employé but to write his ticket, and writing it was confession.

While the Senate Committee are investigating the "outrages" at the South, would it not be well also to investigate the "threats" and "intimidations" by which "a few individuals controlled the vote of a large population"? While the "tissue-paper ballots" of South Carolina and the "fan-tail tickets" of the West are calling public attention to the form of the ballot and needed changes therein, would it not be well to consider the question, Shall we have a secret ballot?

As bearing on this question, I cite the existing laws of Massachusetts and California on the form of the ballot.

The first Massachusetts provision now in force is found in the Revised Statutes of Mass., Supplement of 1854, Laws of 1851, chapter 226, entitled "An Act for the better security of the ballot":

"Sec. 1. All votes . . . shall clearly indicate, in writing or print, the office for which each person voted for is designed, and shall be deposited in the ballot-box in one sealed envelope, furnished as hereinafter provided, and no vote deposited in any other manner shall be counted."

Then follow provisions for the keeping and distribution of the envelopes by the Secretary of the Commonwealth.

This, we believe, has never been expressly repealed, but it was virtually repealed by chapter 7 of the General Statutes of Massachusetts, which chapter is entitled, "Of the manner of conducting elections and returning votes":

"Sec. 4. The Secretary of the Commonwealth shall provide and keep constantly in his office a sufficient number of self-sealing envelopes to supply all the voters in the Commonwealth, and shall furnish the same to the clerks of the several towns when applied for. Such envelopes shall be of uniform size and color and bear the arms of the Commonwealth, and no other envelopes shall be used at the polls."

Then follow provisions for distribution of the envelopes:

"Sec. 12. No vote shall be received by the presiding officers at any election provided for in this chapter unless presented for deposit in the ballot-box by the voter in person in a sealed envelope, or open and unfolded, and so that such officers can know but one ballot is presented."

The Act of 1874, chapter 376, which amended some sections of chapter 7 of the General Statutes, left the above sections in full force, and there has been no legislation touching the question since. Practically, the envelopes are unused and the ballots are folded; the opinion of the officers of election that "but one ballot is presented" being considered a satisfaction of the statute.

The California law presents a strong contrast. It is found in the "Political Code of the State of California," at chapter 8, entitled "Election Tickets and Ballots," to wit:

"1185. A ticket is a paper upon which is written or printed the names of the persons for whom the elector intends to vote, with a designation of the office to which each person so named is intended by him to be chosen.
"1186. A ballot is a ticket folded in such a manner that nothing written or printed thereon can be seen."

[The authority cited by the annotators of the code for this definition is Wharton's 'Law Lexicon,' title "Ballot."]

"1187. Every ticket must be of paper uniform in size, color, weight, texture, and appearance.

"1188. The Secretary of State must provide and keep constantly on hand a sufficient quantity of paper uniform in color, weight, texture, and appearance, without marks of any kind thereon, to supply the demand for paper for tickets."

After provisions for the disposal of this paper comes Article 1191:

"No ticket must be used at any election, or circulated on the day of election, unless—

"1. It is written or printed on paper furnished by the Secretary of State, or upon paper in every respect precisely like such paper;

"2. It is four inches in width and twelve inches in length, or within one-eighth of an inch of such size;

"3. If printed, the names of the persons voted for and the office designated are printed in black ink and in long-primer capitals—the name of the office in small capitals, and of the person in large capitals—and both without spaces, except between the different words or initials in each line;

"4. If printed, the same margin is left above the printed matter as below it, and the side margins are equal in size;

"5. If printed, the lines are straight and the matter single-leaded;

"6. If written, the matter so written that no sign thereof appears when the paper is folded; and,

"7. It is free from every mark, character, or device, or thing that would enable any person to distinguish it by the back, or when folded, from any other legal ticket or ballot."

Then follow provisions that no folding or unfolding, giving or receiving, exhibition, or request to see any tickets or ballots intended to be voted, shall be permitted within a hundred feet of the polls; that no device of any kind, or any distinguishing mark, shall be placed on the inside or outside of any ballot or ticket used by any person or class of persons; and then:

"1198. Every ticket, when used as a ballot, must be folded crosswise, four times from the centre, so as to make the ballot three-fourths of one inch in size, and must be pressed flat.

"1199. No ticket must be folded in a manner to indicate its contents when used as a ballot."

These are the principal provisions of the Code which relate to the secrecy of the ballot. The law savors of excessive legislation, but the question is, Shall the State enforce secrecy of the ballot by prescribing minutely all conditions necessary to that end?

Other States have similar provisions, but none go so far as California. The election law of the Dominion of Canada might well be cited if there were room.

Under the law in Massachusetts, and many States which have similar laws, the number of votes for each candidate can be accurately known at any hour of election day—the very condition which Tweed labored so hard to bring about—and the right of the voter is liable to subversion by outside pressure, "intimidation," and "outrage." What shall be the remedy? M. S.

CAMBRIDGE, MASS., Dec. 26, 1878.

[We agree with our correspondent in thinking that the form and color of the ballot are matters of growing importance. The great "onion-skin" frauds at the South, which the Republicans started in Florida in 1876, and the chief perpetrator of which now holds, or very lately held, a Government office in Washington, are signs of the times which need attention. "M. S." forwards us the Republican ticket used at the last election in Massachusetts. It is twelve inches by six, and has a flaming pink border which throws out branches towards the centre of the back, and has a Republican endorsement in letters half an inch in height.—ED. NATION.]

Notes.

LITTLE, BROWN & CO. have just published a third edition of President Brown's 'Life of Rufus Choate,' the edition of 1869 being quite out of print. A fresh obituary notice (of Rufus Choate's older brother David) and several new notes increase the matter and the value of the work, a large part of whose public favor is doubtless traceable to the legal profession.——Mr. Sidney S. Rider's "Rhode Island Historical Tracts" have grown to No. 6, commemorative of the battle of Rhode Island, Aug. 29, 1778, of which the centenary was celebrated last year. In addition to the oration of the day, the contemporary English, Hessian, and American accounts of the battle are given, together with a general order of Gen. Sullivan, on the day after the battle, vindicating the good conduct of the colored regiment whose enlistment, with Washington's approval, from slaves thereby made freemen, is one of the most interesting events of this campaign.——The 'Hand-book of Boston' published by Moses King (Cambridge, Mass.) groups under fanciful chapter-headings a good deal of information about the city, and is plentifully illustrated in various ways and with various degrees of artistic excellence. The commercial character of the undertaking is too little concealed.——The American Book Exchange, in this city, has begun the publication of a cheap foreign-eclectic monthly *Library Magazine*, of better shape than print; and has, we know not by what right or arrangement, begun the republication of 'Chambers's Cyclopædia of English Literature,' in eight volumes of the same form and quality as the magazine.——'The Telegraph in America; and In Memoriam Samuel F. B. Morse and William Orton,' by James D. Read (New York: Derby Bros.), is a bulky collection of what seem to be cuttings from prospectuses and reports of telegraph companies, from newspapers and other publications; and contains, apparently, no important original contributions to either the science or the gossip of the subjects to which it relates.——The less technical contents of the latest Bulletins of Dr. Hayden's Geological Survey (Nos. 2, 3, 4, vol iv.), are Mr. J. A. Allen's discussion of Wallace's theory of the geographical distribution of animals, and Dr. Coues's field-notes on the birds of Dakota and Montana on the forty-ninth parallel. Important to the specialist is the White-Nicholson 'Bibliography of North American Invertebrate Palæontology'; and of wide interest the historical-descriptive catalogue of photographs of North American Indians, by W. H. Jackson, photographer of the Survey. This authentic ethnologic collection "embraces over one thousand negatives, representing no less than twenty-five tribes."——B. Westermann & Co. send us Part 20 of Spruner's Historical 'Hand-Atlas,' containing maps of Europe at the time of the Third Crusade, 1190; of the Slav realms, 1328–1480, and 1480 to 1689, *i.e.*, to the time of Peter the Great; and of Hungary in its ecclesiastical divisions from the beginning of the fourteenth century to the Reformation. Among the numerous side-maps are plans of the cities of Novgorod and Moscow. The same house have received the prospectus of the new edition of Stieler's 'Hand-Atlas,' only three years having elapsed since the last edition was finished. The marked deficiencies of the Central and South American maps will now be repaired by ten wholly new ones, and Stanley has made necessary a new map of Central Africa. The first part will be issued in February, and there will be 32 in all, embracing 95 maps, at 65 cents each. An important supplement, a map of the Mediterranean in eight sheets, begun by Dr. Petermann and completed by Dr. Berghaus, is offered at half price to subscribers to the main atlas.——American literature receives growing attention in France, especially in the *Revue des Deux Mondes*, in the pages of which Mr. Aldrich's "Reine de Saba" has been followed by Mr. Henry James, jr.'s "Quatre Rencontres," which will be recognized as the recent contribution to *Scribner's Magazine* called "Four Meetings." It is a little surprising that Mr. James's more important studies of American character as affected by European environment, notably "Madame de Mauves" and the "American," have not yet been transferred at length into French. Among the French Christmas books appeared 'Les Bébés d'Hélène, imité de J. Habberton' and illustrated by Bertall.——Provost Stillé, of the University of Pennsylvania, announces that he will admit, on personal application for tickets, fifty ladies to his February course of lectures on the history of the Eighteenth Century.——The publication of the *Magazin für die Literatur des Auslandes* has passed into the hands of Wilhelm Friedrich, at Leipzig, having been heretofore published at Berlin. A change of which we can better appreciate the value is the abandonment of the Gothic letter. This useful periodical is now in its forty-eighth volume.

—An important announcement is made by the Cincinnati Musical Festival Association, of which Mr. Theodore Thomas is the musical director. They offer a prize of a thousand dollars "for the most meritorious work, for chorus and orchestra," to be performed at the Fourth Festival, in May, 1880. The competition for this "is to be open only to native-born citizens of the United States," and the work offered "must not occupy more than sixty minutes" in the performance. Other conditions are that "the full score and a piano score" must be placed in the hands of the president of the board of judges in Cincinnati on or before October 1, 1879, and that the real name of the composer shall be sent in a sealed envelope designated by the title affixed to the work. The successful author will retain his copyright, while the association pays the cost of publication, retaining some privileges. The only one of the five judges already named is Mr. Thomas, the president.

—All the requisites of a popular magazine are well met in the February

Harper's. Mr. James C. Beard's "Treasures of the Deep," discoursing of sea-shells, corals, the nautilus, sponge-fishing, turtle-catching, and other submarine industries, and beautifully illustrated; Mr. Benjamin's unliterary, yet hardly to be called dull, "Rambles in the South of France"; Commander Meade's pregnant sketch of the life of the late Admiral Hiram Paulding; Mrs. Gibbons's rambling but fresh observations on "French Farmers"—these, in one degree or another, will all repay reading, and will not be overlooked either. Mr. Mather's "Winter Sports in Canada" touches the subject somewhat too lightly, whether one's expectations are based on the title or the excellent woodcuts. By far the best traveller's tale in this number is Mr. Mauris's "At the Mouth of the Amazons," a lucid and impressive account of the Isle of Marajó and of the city of Pará; this, too, very prettily illustrated. Mr. Horace E. Scudder's "Education by Hand" (a misnomer for "Education of the Hand") treats of some Boston notions about manual training which deserve study and imitation. The question is whether the Institute of Technology, with its laboratories and Russian workshops, and the Industrial School Association (outgrowth of a very original Whittling School), are making good the apprenticeship system which Franklin supposed would last for ever. Mr. Scudder thinks not, but that we may yet see our way clear to grafting mechanical instruction upon the common-school system, just as drawing and sewing have already been added to it. To many readers the cream of this number will be the long series of Mendelssohn's letters to Madam Moscheles here printed for the first time in English. They are valuable as revelations of the writer's character, but have rather a domestic than musical interest, except for a few judgments here and there, and an unpublished composition on Heine's "Im Kahn." The letters of 1832–3 are full of allusions to the unmusical reputation of the Berlinese. "She [Madam Moscheles's sister] looked at me angrily, and asked what was to be got in Berlin, and who took any interest in music *there*." It is a pretty conceit of Mendelssohn's, when giving a pressing invitation to his correspondent, "I wish I could enclose a starling that could say, Come." The letters are abundantly annotated by Madam Moscheles.

—*Scribner's* for February emphasizes, as it has done before, its "leading article" with a portrait frontispiece. This time the subject is Emerson, the artist Mr. Wyatt Eaton, interpreted by Cole's admirable graver, and Mr. F. B. Sanborn says of the result that it "well presents the aged poet, now passing into silence." The picture perhaps reveals too strongly this transition, at least for those who knew Mr. Emerson in his prime, and who remember his features in all their strength and sharpness, and love to think of his face as the highest Yankee type of character. There are numerous other illustrations, all admirable, to "The Homes and Haunts of Emerson," of which no one is better qualified to speak intimately than Mr. Sanborn. What is noticeable in his point of view is the almost exclusive attention to the poetic side of Mr. Emerson's genius, and in this Mr. Sanborn no doubt anticipates the judgment of posterity, unless that is to be affected by the publication of his literary remains. We are told that—

> "Scarcely any of his numerous sermons have ever been published; most of his speeches on political and social occasions remain uncollected and unedited; many verses exist only in manuscript, or have been withdrawn from publication; and even of his lectures, from which he has printed freely for nearly forty years, a great many still remain in manuscript."

We must pass briefly over the other illustrated articles. The second instalment of "The Tile Club at Play" has more literary style and rather more substance than its predecessor, chiefly owing to the Club's having fallen in with a sweetheart of John Howard Payne. The praise given in the text to Mr. Quartley's luminous sketch, "A Catch of Menhaden," is well justified by the engraving on p. 464. Mr. Stedman's paper on "Aërial Navigation" disappointed us, whose faith, by the way, in the ultimate realization of the art is not inferior to his own. He seems to have set out on the principle that a problem well stated is half solved; but in the end are we not just as wise as we were before? Whether we imitate birds or fishes, the first desideratum is a motor; that once invented, the rest offers no insuperable difficulties. Mr. Russell Sturgis's paper on John Leech is, for obvious reasons, second in point of interest, as well as of time, to his other on Cruikshank. Worth quoting is the following remark:

> "It is not customary to consider Leech as an unfortunate man, an artist who never had a chance; but an essay could be written treating of his art from that point of view, as showing talents never rightly employed, rare gifts unsuspected by his contemporaries, and a tragic force which he hardly suspected himself."

The fac-similes are chosen with the discrimination of a connoisseur, and include examples of Leech's essays in etching and lithography, as well as of his designs for the block.

—The noticeable articles in *Lippincott's* are Mr. Edward King's first paper on "Hungarian Types and Austrian Pictures," Mr. John R. Tait's "A Hungarian Artist," Felix L. Oswald's "A Gate to the Nether World," and Maria P. Woodbridge's "The Latter Days of the Blennerhassetts." One of Mr. King's Hungarian types is the painter Munkácsy, and his admiration for the noble head of this artist will be confirmed for most readers by the portrait which subsequently introduces Mr. Tait's sketch of the romantic career of the same interesting personage. Mr. Tait's studio adjoined Munkácsy's at Düsseldorf some ten years ago, and the intimacy which thus sprang up has enabled the American to give us a very near view of an original and charming character. The article is agreeably written and effectively illustrated. Personal knowledge and the literary sense also distinguish Mr. Oswald's account of the origin of the Mexican volcano, Monte Jorullo, and its mischief-making for more than a century. There is strong probability that many years will not elapse before the Mexican capital will be connected with the railroad system of the United States, and whenever that event occurs there will certainly be tourists resolved to test for themselves the wonders of "the greatest natural curiosity of the American continent south of Niagara Falls"—the sixteen-miles-long volcanic ditch, namely, called the *barranca*, of which a good idea is given in one of the cuts. The latter days of the Blennerhassetts were full of wretchedness caused by poverty and the degrading and even dishonorable shifts of the father to obtain a living, and by the drunkenness and imbecility of the sons. The only bright spots in the gloomy picture here drawn are the constant affection of Mrs. Blennerhassett for her unworthy and unfortunate offspring, and the fast friendship of the Emmets, whose acts of charity to this stricken family would alone have merited the conspicuous monument in St. Paul's churchyard. In the "Monthly Gossip," admirers of Turgeneff will find something to arrest their attention in connection with the genius and personality of the poet Pushkin.

—In 1749 some amateurs acted Otway's "Orphan" at the Coffee-House in State Street, Boston. This, the first public attempt to introduce the drama into Puritan New England, was received with horror and dismay. A stringent law was passed in the next General Court by which all theatrical performances were prohibited, the owner of a building in which such performances should take place being liable to a fine of £20 "for each and every day or time," and the actors and spectators to a fine of £5 each. This law was successful in preventing all public acting for many years, though private theatricals were not uncommon. In 1792 a "New Exhibition Room" was opened with a variety performance, consisting chiefly at first of rope-dancing and gymnastic exercises. This probably proved an insufficient attraction, for on a later play-bill we find announced "A moral lecture in five parts, in which the dreadful effects of conspiracy will be exemplified." Under this guise the unsuspecting citizens were lured to see Otway's "Venice Preserved." Other plays, as "Romeo and Juliet," and "Hamlet," were also given as "moral lectures," or "moral dialogues." It was too flagrant an evasion of the law, however, and the "Exhibition Room" was closed in Dec., 1792, notwithstanding the violent opposition of the playgoers. There was evidently now such a strong public sentiment in favor of the drama that no attempt was made on the part of the authorities to prevent the building of the "New Theatre," on Federal Street. This was opened on Feb. 3, 1794, with a recital of a dedicatory ode by Robert Treat Paine, jr., and the performance of Brooke's tragedy, "Gustavus Vasa," and O'Keefe's farce, "Modern Antiques." Thus at length the drama obtained a permanent foothold in Boston. A new interest has been given to this event from the recent discovery that a number of the plays performed during this first dramatic season were published at the same time by David and John West. These were: "Hamlet," "Twelfth Night," "The Revenge," "Belle's Stratagem," "Natural Son," "West Indian," "Foundling," "Busybody," and "Provoked Husband." An additional value is lent to this discovery from the fact that the hitherto earliest recorded publication of Shakspere in this country is the edition of his works in Philadelphia, in 1795–6. It is, of course, possible that there will be brought to light earlier editions, but at present the "Twelfth Night" and "Hamlet," published in Boston in 1794, are the earliest known American editions of any of Shakspere's plays.

—The Bishop of Gloucester's hopes of advancing the gospel in India by occupying the Afghan passes and acquiring a "scientific frontier"

seem more bizarre than ever to those who apprehend the small effect already produced on the Hindu mind by missionaries and colleges. A recent writer in the *Academy* (for December 28, 1878) has undertaken to make this clear as regards Southern India. Writing of the Presidency of Madras, with a population of about forty millions (thirty-three millions in British territory), he shows that the annual number of graduates of the University and the Medical College falls short of one hundred, and that the only way in which they could work on so large a population would be by books and periodical publications, by which the higher and middle classes are, so far as literacy goes, quite able to profit. But there is not the least sign of such activity among these graduates, though printing-presses abound. Only six of them contributed to the 636 publications which appeared in 1877 in the Madras Presidency, and but ten other persons who had "had an education of the higher kind under Europeans." "So far as these books can be taken as a basis for an opinion, the University and high-schools might as well have never existed." The Hindu and Mohammedan tracts surpass in number those of all the Christian sects, while their medical books "are miserable trash, and there is no sign that European medicine has ever been taught in the country." The same is true of astronomy, for astrological publications are numerous, and the "almanacs are purely astrological and are full of the grossest superstitions," by which the Hindus of South India are completely ruled—a fact which, the writer thinks, explains "the impossibility of understanding the motives of the Hindus." Finally, "the educated Hindus nowadays wear as prominent sectarian marks on their foreheads as the most bigoted fanatics," and their former curiosity about European science and literature has been succeeded by utter indifference. Mr. Burnell asserts that in South India "the result of contact with foreigners has always been a revival of Hinduism," and believes that another such revival has undoubtedly begun.

—A late number of the *Revue Scientifique* compares the French workingmen's club, "Cercle Franklin," with the reactionary "Cercles Catholiques," founded in 1870 by the Comte de Mun. The purpose of the latter is, as might be expected, to bring the working-classes to accept the principles of the Syllabus, and to follow implicity the lead of the directing classes. The object of the *Cercle Franklin*, which now has about two thousand members, is to make the workingman capable of directing himself, and its methods are somewhat similar to those of the better kind of our Young Men's Christian Unions, with the religion carefully left out. Lectures, concerts (the hall seats eighteen hundred persons), a library, and periodical reading-room, classes in geography, history, science, a gymnasium, billiard-tables, fencing-rooms, offer to the members instruction, amusement, and exercise. The laborer brings his wife and children to enjoy and profit with him, with a certainty that neither his political nor his religious independence will be interfered with; he will not be urged to vote for this or that candidate, or offered prizes for good attendence at mass or confessional—a security very grateful to those who have felt the irksomeness of clerical pressure, and the difficulty of resisting those who, in the name of truths which one believes, urge him to practices which one despises. The Mulhausian *Cercle* will be another aid to France in keeping in that path of political sobriety upon which she has lately entered.

—Prof. Angelo de Gubernatis, the well-known author of 'Zoölogical Mythology' (London, 1872), has recently published a companion work devoted to the vegetable kingdom. The first volume, all at present published, bears the title, 'La Mythologie des Plantes, ou les Légendes du Règne Végétal' (Paris: Reinwald & Cie. 1878). The volume is devoted to "general botany," the material being arranged in the form of a glossary. The author in the preface gives a concise idea of the extent and importance of the subject, and the chronological and geographical "displacements" which have taken place in the mythology of plants. Among the most interesting articles are those devoted to the legend of the wood of the Cross, involving a discussion of the whole subject of Adam's fall, the mythical signification of the tree of life, and the fig-leaves that served our first parents for garments. Intimately connected with this article are those on the *arbres anthropogoniques* and the *bâton*. Under the title of *Bernacles* (*arbre aux*) the author examines the myth of the geese supposed to grow out of the barnacle-shell, and arrives at conclusions different from those of Max Müller, who ('Lectures on the Science of Language,' second series, p. 533) explained the myth by a confusion of the word *bernaculæ*, the Barnacle-goose (which he derives from *Hibernia*, *hibernicæ*, *hiberniculæ*) and *bernaculæ*, the Barnacle-shell (from *pernacula*, diminutive of *perna*). De Gubernatis, on the other hand, connects this myth with that of the *barometz* (the plant supposed to produce lambs), which he thinks gave a Latin diminutive *baranicula*. He has collected a large amount of material relating to the flowers and shrubs connected with the various ancient and modern festal days, or devoted to certain saints, or to which are ascribed magical properties. As in his 'Zoölogical Mythology,' he has drawn largely on the popular botany contained in folk-tales and popular customs and usages. The work was composed in French by the author himself, and is written in the same enthusiastic style as his other works. The conclusions he reaches will seem extreme to many, but all students of comparative mythology will be grateful to him for placing at their disposal in such a convenient form a large amount of valuable material. The second volume will contain the "special botany," in the shape of a glossary of individual plants, etc.

—Dr. Hans von Bülow is not so well known in the capacity of a literary man as his great predecessor, Liszt, but once in a while he writes a letter or an article which usually contains some bright ideas and a few positive criticisms well worth having. Two years ago he wrote for the *Allgemeine Zeitung* an article in behalf of the young Russian school of composers, which he thinks is destined to take the place of the modern Italian school, now in its final agonies. The present is an opportune moment for recalling this opinion, in view of the recent sale at Paris for non-musical purposes of the famous Italian Opera, which, in the golden age of the peculiar æsthetic monstrosity known as the lyrical drama, used to be the nightly rendezvous of the wealth and fashion of the French capital, every box being a sort of private reception-room. It is also an open secret that the director of the Italian Opera at Berlin has been brought back from the very brink of ruin by the timely arrival of Patti, whose magic gifts sufficed to make even the Berliners for a moment forget their antipathies. There can be little doubt, therefore, that the Italian Opera and Patti will be buried in the same grave. The older Italian music, on the other hand, of the Palestrina epoch, is now becoming better known every year, which is an encouraging sign of the times. There is still room, however, for new musical currents, and it is to be hoped accordingly that Von Bülow's sanguine expectations of the Russians may not be disappointed. In a late number of the Leipzig *Signale* he calls attention to a new *geniale Neuling*, Herr Rimsky Korsakoff, of St. Petersburg, "who stands to Tchaikoffsky in somewhat the same relation as the latter does to Glinka, the father of Russian music." Tchaikoffsky the doctor considers a genuine tone-poet, whose new string quartette in E flat minor, second symphony, and orchestral fantasia, "Francesca da Rimini," have fairly intoxicated his ear by their freshness, vigor, depth, and originality. Outside of Germany, Von Bülow thinks, the best music is nowadays in St. Petersburg and in Paris, by Saint-Saëns, Lalo, Massenet, and Delibes. Rubinstein is nowhere mentioned, but artists, like editors, are not in the habit of alluding to their rivals. And then Rubinstein can scarcely be classed with the Russians, for he is a thoroughly German musician. This tendency in prominent non-German composers to follow the strong current of German music is rather to be regretted than otherwise. The tendency of modern intellectual culture being to wipe out all national differences in the habits of thought and manners of different peoples, it is very much to be desired that in art, at least, may be preserved some traces of that local color which gives life and variety to our æsthetic impressions. Those who are familiar with several languages know what a luxury it is to pass from an English to a French or German book once in a while; and, although the French style is the most polished, nobody could wish that all books should be moulded on the French type. From this point of view Chopin, whose every note is tinted by the national Polish sadness, is of such great importance that his compositions must be regarded as a rich vein of gold amid the general silver ore of German music.

BISMARCK AND DR. BUSCH.*

FEW writers have ever succeeded by a single act in arousing such an immediate and violent thunderstorm of abuse as has Dr. Moritz Busch by the publication of his diary recording the after-dinner talk of Bismarck during the Franco-Prussian war. To understand this it is only necessary to know how frank and unsparing the Chancellor is in his criticisms of men and things, and how he never fails to impress his views on all minds by the vigorous and pointed or sarcastic way of expressing them. A phrenologist, after reading Dr. Busch's two volumes, would confidently declare *à priori* that on Bismarck's skull there must be a deep

* 'Graf Bismarck und seine Leute während des Krieges mit Frankreich. Von Dr. Moritz Busch.' 4th edition. Leipzig: F. W. Grunow; New York: B. Westermann & Co.

concavity at the place where the bump of reverence for mundane officials and institutions ought to be. In his political speeches and other public utterances he is careful, like all other mortals, to take off the sharp edge of his opinions by the choice of a judicious phraseology, but in the familiar conversation at his own table no such pains are taken ; we see his real opinions unembellished, and as it were under a microscope. Hence it is that the German press has been almost unanimous in pronouncing Dr. Busch's publication a monstrous indiscretion, and it must be admitted that in many respects it is an indiscretion. A person of more tact and better judgment would have omitted the most offensive passages altogether, or at least reserved them for a *post-mortem* edition.

Barring this weakness, however, Dr. Busch had all the qualities which are required for carrying out an enterprise such as he had undertaken. He had, in the first place, a proper share of that mental attitude known as hero-worship. Then, he had a ready and practised pen, having for some years been editor of a prominent weekly paper ; a knowledge of languages, acquired during his extensive travels in America and elsewhere; and, finally, a good memory, which enabled him to put on paper the Chancellor's utterances in the spicy words and direct sentences in which they were expressed. Besides reading the newspapers and cutting out, marking, or translating important articles in them for the King or for Bismarck, his chief function was to prepare for the German and English press "inspired" articles. For this purpose he was repeatedly summoned every day by the "Chef," as the Chancellor was called, to get ideas, comments, and statistics for elaboration into articles or telegrams. From the revelations here made it appears that Bismarck is himself one of the most active of journalists, and constantly reads the leading political papers of the European capitals. If he comes across an article which falls in with his aims he takes measures to have it multiplied. "This article," he says on one occasion, "must bring forth young ones." Unfavorable criticisms and slanderous statements, on the other hand, are as carefully refuted. His habit of reading the outrageous lies which the French papers circulated about his character and his policy during the war, to some extent accounts for his low estimate of the French and for his bitter comments on them, which very probably do not express what are his real sentiments in more sober moments. In these pages he figures as a veritable "swallower of Frenchmen," who goes so far as to assert even that "all Englishmen who speak good French are dubious characters." He only excepts Lord Odo Russell, evidently because he "can also express himself well in German."

Dr. Busch appears to have some faith in the maxim that "Der Mensch ist was er isst"—A man is what he eats—and accordingly he devotes a good many pages to an account of the culinary tastes of the Chancellor, who, like Humboldt, Goethe, and other great Germans, always brings a good appetite to his dinner-table, a peculiarity for which, he asserts, all his ancestors distinguished themselves : "If many of such capacity were in the country, the state could not exist ; I should emigrate." "If I am expected to do good work I must be well fed." His friends and admirers in Berlin appear to have been aware of this peculiarity, for they kept him well supplied at Versailles with all the delicacies of the season, so that even the Crown Prince, when dining at his table, expressed astonishment at the luxurious *menu*. The Germans have succeeded in their desire to have "a corpulent Chancellor," for he is known to be one of the most corpulent men in the Empire—a somewhat strange fact in consideration of his very delicate and irritable nervous system, which, after the very exhaustive work of a day, often keeps him awake all night. In his comments on various articles of diet he displays as much knowledge as if he was chief cook instead of chief politician of his country. Yet his remarks on the culinary art are not exclusively from the standpoint of the epicure, but also from that of the anthropologist. Thus, the conversation once turned on the peculiar fact that dog and horse-flesh are never eaten except under compulsion, as in Paris during the siege, although both these kinds of meat have a good flavor. The "Chef" explained this antipathy as grounded on the fact that these animals are so much more our equals in intelligence and sympathies than other animals. "The more a thing is like us the less we relish it. It must be very nauseating to eat monkeys, whose hands resemble those of human beings."

Whether this is the scientific explanation of the peculiarity in question we may leave undecided. Some will feel inclined to class his theory among his superstitions, especially when they find that he harbors various other beliefs which undeniably are superstitions. He objects to eating at a table with a party numbering just thirteen, and he shares the common aversion to beginning anything of importance on a Friday. He firmly believes that the moon exerts an influence on vegetation and on human hair, and thinks he knows the year of his death, although Dr. Busch has wisely suppressed this date. These facts supply evidence that Bismarck is by no means such a radical unbeliever as the clerical press would persuade us ; and we have positive information that he performs certain acts of devotion. Dr. Busch repeatedly found prayer-books lying on his night-table, in which the servant said his master often read at night. Frau Bismarck once forwarded a book of Psalms to her husband, as she was afraid he might not succeed in finding a Bible in France. Still more decisive are pp. 208–211 of vol. i., where he makes the religious confession which has since been so much quoted, and in which the following sentences occur :

"Did I not believe in a divine Providence which has destined this German nation for something good and great, I should give up at once the profession of diplomatist, or else would never have assumed it. . . . Take away from me my faith and you take away my Fatherland. . . . Were I not a strictly orthodox Christian, were my convictions not grounded on the wonderful basis of religion, then would you have never had your present Chancellor. . . . Procure me a successor with that basis and I will go immediately. But I am living among heathens. My desire is not to make any proselytes herewith, but I feel the need of confessing this faith."

His religious orthodoxy, however, does not go so far as to make him approve, among other things, of the English way of observing the Sabbath, which he characterizes as "eine ganz schreckliche Tyrannei." When he made his first trip to England he landed at Hull, and while walking down the street began to whistle an air. A fellow-passenger begged him not to whistle, and, on being asked why not, replied because it was Sunday. This so offended Bismarck that he immediately bought a ticket for the next steamer to Edinburgh—which was, of course, out of the frying-pan into the fire. However, he does not approve of working on Sundays, on hygienic grounds, although he adds that farmers in harvest-time must be exempted from this rule, as well as diplomatists, who are obliged to receive messages and telegrams every day.

How far Bismarck's statements on religious matters are to be taken as sincere and how far as inspired by policy is not easy to say. He also preaches *tolerance* most emphatically, and yet nothing could be more discordant with such a text than his ecclesiastical policy, his treatment of the Socialists, and his suppression of liberty of speech and press. His financial policy excepted, no fault can be found with his aims. His enemies, the Ultramontanes and Socialists, are also the enemies of culture and progress. But he greatly errs in the measures which he takes to secure his ends, and has not yet comprehended the first axiom of political philosophy—that opinions cannot be put down by force. He is now the most influential and independent of living statesmen, but he is also the most unscrupulous and iron-hearted of despots. Of the truth of this assertion Dr. Busch's diary furnishes abundant testimony. The Chancellor is continually complaining that the military authorities are too mild in their treatment of the enemy. He insists that villages in which treason occurs should be forthwith burned to the ground and all male inhabitants hanged. The *francs-tireurs*—disguised soldiers who shot at the Germans from ditches and then disappeared in the forest—are especial objects of his anger, and he breaks forth into abuse every time he hears that his soldiers have captured some of them, instead of shooting them on the spot. It occurred very frequently during the war that captured French officers broke their word of honor and made their escape. When news was brought the Chancellor that General Ducrot, on his way to Germany, had made his escape in this manner, he exclaimed: "If any of these rascals who have given their word of honor—the others are not to blame—are recaptured, they ought to be hanged in their red breeches, and on one leg should be written *parjure*, on the other *infâme*." On the 20th of January a French officer came to ask for a two days' truce in order that the dead of the previous day might be removed and buried. Bismarck replied that this could not be granted, that a few hours would suffice for the work, and that, moreover, the dead were just as well off above as below ground. It is somewhat humiliating to find that an American general, who frequently dined at his table, gave an instance of military *sang froid* which throws even these cases in the shade. Herr Busch makes General Sheridan responsible for the doctrine that "correct strategy consists, in the first place, in dealing out heavy blows on the military portion of the enemy, and, secondly, in inflicting on the populace so many calamities that it will desire peace and insist on it with the Government. Nothing should be left the people but their eyes to weep over the war." To a certain extent this policy was adopted by the "Chef," for he continually insists that the populace should be so treated as to make them clamor for peace. And this reveals the very essence of

his general policy—a fixed determination to secure his object, at whatever cost to enemy or friend. We say friend as well as enemy, for he is showing just at present by his fiscal policy that his only aim is to secure a certain sum of money for the Government, totally regardless of the fact that by *his* method the people will lose much more than the Government will gain.

Another characteristic of the great Chancellor, revealed by Dr. Busch's diary, is that he feels an intense feline happiness in cruelly playing with his unhappy victims. This is particularly evinced by his treatment of M. Favre. At the same time one cannot help admiring some of his remarks to the Frenchman as good specimens of that sarcasm for which he is noted. In one of the interviews pending the capitulation of Paris, Favre remarked to Bismarck, by way of appealing to his feelings, that even then on a Sunday the Boulevards were crowded with women and children. "Indeed!" replied the Chancellor, "I am surprised to hear that they haven't all been eaten up yet." On another occasion Favre complained that the German artillerists fired at the asylums of the deaf and dumb. "I don't see what right you have to complain of that," was the reply; "you are doing what is a great deal worse than that: you fire at our robust and healthy soldiers (*Sie schiessen auf unsere rüstigen und gesunden Leute*)." M. Thiers also appears to have fallen a victim to his wiles. At an interview held late in October Thiers turned the conversation on the supply of provisions in Paris. "I interrupted him," says Bismarck, "and said, 'Excuse me, sir, we know more about that matter than you who have only been in the city one day. They are supplied with provisions in there up to the end of January.' You should have seen the astonishment depicted on his countenance! But I had only been testing him, and his astonishment told me that my assertion was not correct." A few days later he remarks at the table: "M. Thiers doubtless has some historical work in view. He always protracts our interviews by introducing foreign matters (*allotria*). He tells me what he did and advised on this and that occasion; asks for information about this or that point; what I should have done under such and such circumstances," etc. M. Thiers, on his part, appears to have received a favorable impression of Bismarck, for he subsequently alludes to him as a "barbare aimable."

Bismarck's conversations, like his speeches, support the conviction that, had his tastes led him in other directions, he would have distinguished himself in other spheres as well as in politics. Occasionally one feels inclined to regret that he did not devote his life to literary pursuits. In wit and sarcasm he might have equalled Heine, and he even has a rich poetic vein which, if properly taken care of, might have added much valuable ore to the literary treasures of the Fatherland. Appropriate and well-chosen figures abound in his remarks and letters. He aptly characterizes himself as the pepper in a German political assembly, and of his talent for framing an epigram the following, chosen at random, may serve as a specimen: "A general who unnecessarily exposes himself to danger should be arrested." In short, with all his occasional rudeness and lack of polish, with all his errors in dealing with social and religious questions in a mediæval spirit of repression and violence, he yet remains the centre of gravity of modern politics, and his great work, the unification of Germany, alone would suffice to make him immortal. When the present generation has passed away, those elements in his personal criticisms which now give offence will be less conspicuous, and future generations therefore will not withhold from Dr. Busch some of the gratitude which we now all entertain towards Eckermann and Boswell for having preserved the conversations of Goethe and Johnson for the entertainment and instruction of posterity. If Herr Busch's predecessors had an advantage over him, inasmuch as their conversations cover many years of the life of their heroes, he, on the other hand, has this in his favor, that the seven months covered by his diary constitute one of the most interesting episodes in the history of Europe.

AMERICAN FORESTRY.*

AMERICAN forestry, if it can be said to exist at all in the scientific acceptation of the term forestry, is still in embryo, and the voluminous report on this subject prepared by Mr. Franklin B. Hough, under direction of the Department of Agriculture, and published by Congress, will not serve in any great degree to dispel existing ignorance of what forestry means, or what it can be expected to accomplish. We search in vain for the practical suggestions we had the right to expect in so ambitious a work, or even for anything like a complete presentation of the subject in its different bearings. Mr. Hough has not thought it necessary to divide into chapters or even to classify the mass of material he has collected together, and his index has been so carelessly prepared that it affords but little assistance to the student searching through much chaff for a few stray kernels of knowledge. Indeed, so badly is the report edited that it is safe to say that it contains nothing of permanent value which is not more accessible in its original form. A second volume, containing statistics "of the most valuable character," and which "may be regarded as entirely exhaustive," has been prepared by the same hands, but (we make the announcement with feelings of at least mitigated regret) it has so far failed to pass the House Committee on Printing.

We should not recall, even for a moment, Mr. Hough's report from its position of obscurity beside the other forgotten publications of the useless Department of Agriculture, did not its appearance present an excellent opportunity to consider some of those national questions which the science of forestry must soon be called on to settle for us. Forestry in its relations to this country will be best considered under two heads, economic and physical. It is the sphere of economic forestry to supply the community with forest products by planting new forests where existing ones are, for any reason, inadequate to supply the demands made on them, and to render natural forests more permanent and productive through scientific management. If we except the extreme northwestern and southeastern portions, there is no part of the United States where the demand for forest products will not in a few years far exceed the supply. Everywhere our forests are ruthlessly sacrificed to fire and the axe. Every year the demands made on them are greater, while but little attention has yet been paid to providing for their restoration. Fortunately, however, this evil must in time correct itself, and a scantily supplied lumber market and high prices will soon set every one to planting trees. As soon as our farmers can be made to understand that it will be *more profitable* for them individually to plant portions of their land with trees than to allow it to lie idle, then, and not till then, will tree-planting become general in this country.

To demonstrate that tree-planting is profitable is the first duty of economic forestry. That done, it must show what and where and how to plant. There is hardly any portion of the United States, with the exception of the region lying between the Rocky Mountains and the Sierra Nevada, where a forest cannot be more or less easily and quickly raised; and as soon as it can be satisfactorily shown that timber-planting is a profitable employment for capital, capital will naturally seek this (for us) new form of investment. Little apprehension, then, need be felt about our ultimate supply of timber. It is not improbable that in a hundred years the country will have more and of a far better quality than at the present time. But timber is not produced in a day, and there is a still stronger probability that there will be an era at no distant date when the country will experience great hardships from a scarcity of lumber of all kinds. This, perhaps, cannot be entirely avoided, but the danger will be lessened by a general diffusion of knowledge on the subject of sylviculture, which is already occupying considerable public attention; and perhaps, also, by the enactment in other States of special laws for the encouragement of tree-planting, in imitation of the policy already instituted in New England. Exact knowledge of the economic value of most of our forest trees does not exist, and the want of a comprehensive *sylva* of North America is greatly felt. The preparation, however, of so expensive and elaborate a work can probably not be undertaken on a fitting scale except under the auspices of the general Government.

But we must turn to that more interesting and complex branch of the science of forestry which has to do with the physical relations of forests to the earth's surface, and which, for want of a better name, may be called physical forestry. Without touching even on some of the more difficult problems which this subject presents, it will be sufficient for our purpose to state that the annual precipitation of moisture over any great region is not, so far as is now known, either increased or diminished by the presence or absence of forests. Forests, however, play the most important part in retaining and distributing the rain and snow which falls; and it is observed that as a country becomes cleared of its forests its springs disappear and its rivers flow more irregularly, producing disastrous floods at some seasons of the year, which are followed at others by corresponding periods of unnaturally low water. Fortunately for us, the topography of that portion of the United States which is east of the Rocky Mountains is such that there is little danger here of those devastating torrents that spring from high mountain ranges from which the forests have been cleared. Freshets, more or less severe, occur annually

* 'Report upon Forestry. Prepared under direction of the Commissioner of Agriculture, in pursuance of an act of Congress approved August 15, 1876. By Franklin B. Hough.' Washington. 1878.

in nearly all our rivers, resulting in very large aggregate losses; these can be expected to increase steadily and rapidly until the forests in which they once took their origin are restored. Still, on the whole, little serious apprehension need be felt about the ultimate irregularity of the flow of Eastern rivers, or the ultimate drying up of Eastern springs; for these are evils which will also, to a certain extent, eventually correct themselves. When the scarcity of forest products sets every one to planting new forests or preserving existing ones, those mountainous and hilly regions where rivers and springs originate will naturally be selected the first for planting, as being but little suited for agriculture; and a greater regularity of the water-supply will naturally follow such a restoration of forest area. Under a form of government different from our own such reservoirs of the country's water-supply could well be held and cared for by the nation, but under existing circumstances large Government reservations of wood-lands in any of the older States are now impracticable; and it must be left to individual or corporate enterprise and intelligence to decide the future climatic and fluvial condition of the eastern half of the continent.

West of the Rocky Mountains all is different. The country is cut up by high mountain chains overlooking narrow valleys. The rain-fall is in parts of this region exceedingly small, and everywhere very unequally distributed throughout the year; so that once destroyed it would be difficult or, indeed, impossible to restore any forests of this region beyond the immediate influence of the Pacific Ocean; while its peculiar topography demands that the mountain ranges remain forest-covered that the valleys may be habitable. Large portions of this Western territory are still in the hands of the general Government, and before it is too late steps should be taken to set aside and scrupulously preserve at least such portions of forest-covered mountain ranges as give rise to important streams. It is probably already too late to preserve any considerable part of the scanty forests of the "Great Basin." They are everywhere fast melting away to supply the enormous and often unnecessary demands of the mining enterprises of that regions. These forests, which are of immense age, once destroyed, will never reappear, and the streams which now make agriculture possible in the valleys through irrigation will, at no distant day, flow only during a short period of the year. If any portion of this interior region is worth saving for agriculture, immediate steps must be taken to preserve the remnants of its forests, or it will not long support even its present small agricultural population.

More important still is the necessity for Government or State preservation of some part of the noble coniferous forest which graces the western slopes of the Sierra Nevada. The future of California depends on the existence of this forest. Nowhere on the face of the globe is the physical necessity for preserving the forests greater than in California; nowhere has the world seen its forests so rapidly and senselessly destroyed. We will briefly examine what the dangers are which threaten California, and what should be undertaken to prevent or at least diminish them. All along the western slope of the Sierras numerous rivers head, which, flowing westward through the rich foot-hills and great plains of California, fall into the Sacramento and the San Joaquin, the one flowing south and the other north, and at length emptying into the Bay of San Francisco. Through these rivers must pass all the moisture, not absorbed by the soil, which the Sierras attract from the ocean lying almost at their feet. The annual precipitation of moisture in these mountains, although almost exclusively confined to the winter months, is still very large, a fall of sixty feet of snow during an exceptionally severe winter having been reported in the high Sierras. It results that during the early summer months, when the snow is melting, these mountain streams become large and rapid rivers, carrying off immense volumes of water, and then almost entirely disappearing with the snow. As they are not replenished by summer rains, the length of their annual duration must depend on the slowness with which the snow at their sources melts. It is a well-established fact that snow melts much less rapidly and that much more of it is absorbed in the forest than in the open ground; while the forests on a mountain side offers great mechanical resistance, especially by their undergrowth and coating of fallen leaves, to the rapid running off of water or melting snow. If the forests of the Sierras are destroyed, their annual snow-fall will probably not be materially diminished. The length of time, however, required to melt it will be much shorter; and the absorbing power of the forest being gone, the volume of water passing through the rivers will be greatly increased. It is not difficult to foretell the results. Every season, earlier at the south, later at the north, torrents, more terrible and more destructive than the history of the world records, will carry during a few weeks death and desolation from the mountain-sides down over the foot-hills, covering the plains with débris and holding the cities lying along the low banks of the larger rivers at their mercy. And then, when this terrible rush of a few days is over, it will be found that the whole supply of water for the summer is exhausted. The foot-hills and the plain will no longer produce fruits or vegetables, or any summer crop for which irrigation is essential, for no water to irrigate with will come down from the mountains. "Placer mining" will be a thing of the past, and even the navigation of the great rivers will be either interrupted or abandoned. During the last fifty years more than one country in Europe has been visited by calamities similar in origin and extent to those which now threaten California, but in none of them were the physical reasons for the danger so great. The mountains from which the destructive torrents of Europe have sprung are lower than the Sierras, less heavily forest-clad, and enjoying a more regular precipitation of moisture with a much smaller snow-fall, and so less able to produce sudden and disastrous torrents.

There is but one remedy for the dangers we foretell, and on its adoption depends the future of California. A strip or strips of forest must be set aside along the western slope of the Sierras extensive enough to secure the natural flow of the rivers, and these reservations must be strictly guarded from fire, the axe, and especially from all browsing animals. It is in her boasted millions of sheep that California's greatest danger now lies. These, with countless herds of other browsing animals, are driven up every summer from the plains into the mountains to feed during the dry season. The damage they are inflicting in the Sierra forests is terrible and indescribable. One can ride for days at a certain elevation through the mountains along the sheep-trails without seeing outside of the rare ranch enclosures a single uninjured shrub or a seedling tree of any sort. Everything the sheep can reach is eaten clean. This means that there is nothing left of the forest but its older trees, and that it has lost or is fast losting its best element for holding back melted snow; and it means, too, that there are no new trees coming on to take the place in their turn of their parents. As the number of animals driven to the mountains increases, forest fires increase also, set by the shepherds either accidentally or purposely to increase the next year's feed. A forest annually wasted by fire, on which the axe is always making terrible inroads, and in which no young trees are allowed to spring up, is clearly doomed. When that of the Sierras, the noblest of our continent, has gone, nothing will stand between California and the dangers which threaten her. To preserve California is the first and greatest duty of American forestry. The task is a difficult one, but it can be accomplished if her people desire it.

The French Revolutionary Epoch: Being a History of France from the beginning of the first French Revolution to the end of the Second Empire. By Henri Van Laun. (New York: D. Appleton & Co. 1878. 2 vols. 8vo.)—We do not remember any other work that undertakes to relate the history of France from the outbreak of the great Revolution to the present day. This book is therefore welcome, and will be found serviceable; it is only to be regretted that it stops at the year 1870, and does not, therefore, contain the *whole* of the revolutionary epoch; and that it is so disproportionate in its parts that it is in reality a history of the First Revolution and Empire, with a brief account of the subsequent period attached. The twenty-six years from 1789 to 1815 occupy a volume and a half, so that the fifty-five years that follow have only half a volume left for them. No doubt this results from the relative abundance of materials for the earlier period; but then it is precisely this early period of which we have already numerous excellent accounts, while the important events of the period since the Restoration we are obliged for the most part to pick up as we can. And at any rate, whatever the interest and importance of the earlier period, the sense of proportion and of historical perspective is seriously offended. Nor is this disproportion necessary; the events of these last years, if less dazzling, are varied enough and important enough to fill double the space given to them, and they are very well, if too briefly, related by Mr. Van Laun.

He is, indeed, very good at narration—best when he has not, as in the earlier parts, the shadow of Carlyle hanging over him. We should not say that he imitates Carlyle, although he often quotes him, and refers to him as an authority. But he has studied him to such effect that his style here is unhappily imbued with Carlyle's characteristics. In the second volume his style is far better. Acknowledgments are also made to M. Taine, from whom the introductory chapter is "summarized." The abridgment is fairly done, but it is not the best part of the book; it has the look rather of working upon another's ma-

terials than of independent labor. The lack of mastery over his materials is even more manifest in chap. i., "The Gathering of the Storm." We should not have believed it possible that any student of history should confuse the constitutional events of these years (1774–1789) as is done here. The convocation of "Parliament" by Turgot, Nov. 12, 1774 (p. 36) is evidently understood—or will certainly be understood by the reader—to mean the summoning of a legislative body. The English reader is not told that the French *Parlement* is a totally different body from his own *Parliament*, being judicial and not legislative; and if he happens to know this fact of himself, pains are taken to bejuggle him by speaking of the "convocation of the States-General" in the very next paragraph. The author then proceeds, in a series of paragraphs which read very much like an unskilful abridgment, to relate the early history of the States-General and the Parliament, which are ingeniously melted into one institution, called now by one name and now by the other. For example (p. 38), "Parliament had the right of consenting or refusing to grant taxes"—a right that never belonged to Parliament, but to the States-General. So the expression (p. 40) that "the first Parliament under Louis XVI. is convoked, the Third Estate as yet 'feeling its feet,'" is nonsense. The Parliament had no Third Estate; nor did the Third Estate begin to "feel its feet" until 1788, when the States-General were convoked for the following year. Any one who wishes to see how this process of "feeling their feet" went on can find it graphically depicted by Erckmann-Chatrian in 'The Outbreak of the Great French Revolution.' But what Mr. Van Laun means by saying at this juncture (p. 77) that De Brienne found himself "without plenary court and without Parliaments" we cannot conceive. Without Parliaments, of course, as the previous pages very well show; and of course, too, without plenary court, for this had not existed since the sixteenth century; but as well say without College of Cardinals or *Comitia Centuriata*.

Astronomy. By R. G. Ball, LL.D., F.R.S., Astronomer Royal for Ireland. Specially revised for America by Simon Newcomb, LL.D., Superintendent American Nautical Almanac, formerly Professor at the U. S. Naval Observatory. (New York: Henry Holt & Co. 1878. 16mo, pp. 152.)—If the object of the average science-primer were to amuse, there could be no fault to find with it; but, as far as America is concerned, it is next to certain that this kind of books as a species has done more harm than good. They are bought by two general classes of readers, we suppose: first, by those educated men who have forgotten the details of the astronomy they learned at college and wish to refresh their ideas; second, by intelligent boys and girls who wish to forestall or supplement their school-lessons in this subject. For the first class the science-primer, as we commonly find it, is quite too bewilderingly and condescendingly simple, as it omits all the difficulties and most of the facts. For the second class, it is noxious and deceptive, as it leaves them with the idea that they really understand something, at least, of the subject, whereas no subject can be at all comprehended if every difficulty is uncandidly avoided, as it must be in these small works.

These strictures on science-primers often apply to much larger and more ambitious works on astronomy. But they do not in general apply to Dr. Ball's work (one of the "Hand-books for Students"), which is direct, comprehensible, and valuable, and which will require, as it demands, some thought from the lad for whom it is presumably written. The reason why it is so much better than its congeners is largely due to its method of approaching difficulties. An illustration will make this clear. It is a question of the precession of the equinoxes, its amount, its effects, and its cause (chapter xiv.) The argument is as follows: a method for experimentally determining the right-ascension of a star has already been explained. This method has been applied to Sirius, for example, at different epochs, and the resulting right-ascensions of this star for 1847, 1857, 1867, and 1877 are set down in a table. The data the student must take on faith. These numbers vary by about 2.65 seconds per annum. The phenomenon to be explained is then accurately stated. It is that Sirius and the vernal equinox are now further apart than they were thirty years ago and that the change is progressive and uniform. This is true for any star. Hence, the motion is in the equinox and not in a particular star. But the equinox is the intersection of the equator and ecliptic. The ecliptic is at rest. Hence, the equator moves on the ecliptic. Observations of the north-polar distance of Sirius show a change also. These observations are given and the rate of change is determined. This change is one of the position of the celestial pole. Such a change might produce a change of the obliquity of the ecliptic or the angle between equator and ecliptic. The values of this angle determined by observation for 1847, 1857, 1867, 1877 are given. They show that the obliquity is practically constant; hence, the pole of the equator can only move in a small circle about the pole of the ecliptic. The rest of this question is treated in the same logical way, and, by the eleven pages of explanation devoted to the subject, the student with some thought can obtain an accurate idea, not only of the phenomenon itself and its cause, but of how it was discovered originally. This last most important point is usually not considered at all in text books.

It is clear that the method of this treatise is not that of the science-primer, and its value as a text-book is correspondingly high. It is not well printed, the stereotype plates being full of imperfect type. The wood-cuts are very coarse, although always well chosen for the explanation of the text. If this small book meets the success it deserves, these faults can be amended in future editions.

The Dramatic List: A record of the principal performances of living actors and actresses of the British stage; with criticisms from contemporary journals. Compiled and edited by Charles Eyre Pascoe. (London: Hardwicke & Bogue; Boston: Roberts Bros. 1879. Pp. 358.)—Mr. Pascoe, who is already known in this country as an occasional contributor to our periodical literature, has here prepared a really useful book of reference. Its purpose and scope are fairly stated on the title-page which we have quoted in full above. Mr. Pascoe has done for the more important living actors of England what Mr. W. Clark Russell, in his admirable 'Representative Actors,' did for the long line of great dramatic artists who had succeeded one another on the stage of Great Britain from the days of Betterton to our own time; and what Mr. T. Allston Brown ambitiously attempted to do for all American actors, past and present, in his miscalled and ill-made 'History of the American Stage.' As in Allibone's 'Dictionary of Authors,' the brief biography of each of the more prominent performers is set off by extracts from current criticism, taken in general from the *Athenæum*, *Times*, and *Telegraph*. It is a pity that more carefully considered criticism could not occasionally have been chosen, as, for instance, from Mr. Lewes's 'Actors and Acting,' or from Prof. Morley's 'Journal of a London Playgoer,' or from other similar works, in place of the necessarily hurried verdict of the weekly or daily journal. But Mr. Pascoe's selections are for the most part very well made, and they add greatly to the value of his volume. Somewhat too much space, perhaps, is given to the mere recital of plots of plays—a recital which can have only an indirect use in estimating the merit of the actors in them. Now and again, it is also to be noted, the same extract is used twice, appearing under the name of each of the performers in the scene (see for examples pp. 21 and 221, and pp. 79 and 118).

The biographical sketches are, as a rule, sufficiently full and yet concise; and the actors and actresses whose lives are given are in the main those who deserve the prominence here bestowed upon them, but the book would need to be at least a quarter larger to be anything like complete. Although Mr. Pascoe apologizes for the omission of absentees from England, one seeks in vain with surprise for the names of Mr. Coghlan, Miss Dyas, and Mr. Rignold. The use of the words "British Stage" in the title-page is not quite accurate, for no attempt is made to cover other than the London theatres. Many of the actors and actresses whose careers are to be found at length in these pages are wholly unknown in this country; not a few, however, are either Americans by birth or training, or have made themselves as well known in the United States as in Great Britain—the one class being represented by Joseph Jefferson, J. S. Clarke, and Hermann Vezin; the other by Sothern and Chippendale and Mrs. John Wood.

It is a pleasure to handle so well printed and well bound a volume as the 'Dramatic List.' The following errors may be divided among the compiler and the proof-reader: The right name of Mr. Wigan's version (p. 355) of M. Sardou's "Nos Intimes" is "Friends or Foes"; Mrs. F. A. Kemble's play (p. 212) is not the "Heir" but the "*Star* of Seville," and Mrs. Bancroft acted (p. 18) in Mr. W. S. Gilbert's exquisite "Sweethearts," not in the slightly antiquated "Sweethearts and Wives." There are two misprints of French proper names: the name of Mlle. Bartet, the latest recruit of the Comédie-Française, is misspelt (p. 18) with a final *l*, and M. François Coppée, the author of the tender and poetic "Luthier de Crémone," appears (p. 252) as Copyer.

On the Plains; or, How Mrs. Maxwell made her Natural History Collection. By Mary Dartt. (Philadelphia: Claxton, Remsen & Haffelfinger. 1878.)—One learns here how much strength, energy, and capacity

were shown by a woman in shooting and trapping, then stuffing and cleverly mounting a collection of birds and beasts inhabiting Colorado and its neighborhood. The collection was exhibited at the Centennial, and this book is an enthusiastic and ill-written account of a good deal of hard work, undertaken from taste and necessity, and carried through by help of the same stimulus.

Fine Arts.

THE TANAGRA FIGURINES.

A COLLECTION of the interesting statuettes from Tanagra has been received in this city, and has excited a lively pleasure in the few who have yet been invited to inspect it in its present resting-place at a residence in Lafayette Place. The terra-cotta figures from Tanagra tombs have been known to archæologists for six or seven years. In 1872 a native professional excavator, a man from Corfu named Yorgis Anyphantis, began to sack the tombs around the ancient capital of Bœotia, attracted by the reports of the neighboring farmers; a few archaic tombs containing vases were first discovered, and then a series dating from the time of Alexander, each revealing, besides a large bombylios-shaped drinking-pitcher at the head of the skeleton, from two to six statuettes in clay; other statuettes of like character were found outside, scattered over the lids of the sepulchres like the flowers strewn at a funeral, to the number of twenty or even fifty for a single tomb. As the Bœotian statuary betrayed a character entirely novel in Greek art it kindled the immediate ardor of collectors. The Louvre secured over a hundred specimens while the proceeds of the excavations were still a novelty and cheap. Individual French antiquaries followed suit, until the Tanagra statuary became a mania. The Berlin and British Museums obtained small but choice assortments, but very few have reached the hands of private English collectors. The examples now here were obtained at Athens—under every advantage for getting the specimens fresh and untampered with—by M. Gaston Feuardent, of the London and Paris house of that name, who possesses the series we shall describe. Since the earlier discoveries, digging for terra-cottas has been the sole form of agriculture practised by the worthy populace, from the hill of Grimada to the hill of Bratzi; the people from the villages of Skimitari, Liatani, and Staniates, and all their country neighbors of the Lari valley, have cultivated nothing but archæology; the land has become white with upturned earth, and the ancient roads of Bœotia are traced in dry heaps of dust, thrown up from their lines of tombs. The mutilated bits have now been sifted out, their fractures smoothed with a touch of the lathe or potter's wheel, and alarming monsters constructed of heads and limbs stuck together, to the taste of native restorers. These improved specimens, colored with forcible tints due to the triumphs of modern chemistry, are at present plentiful in Athenian shops, but they have been altogether avoided by the purchaser of the present admirable series.

The first sensation felt by the spectator of this miniature statue-gallery is the genial and familiar character of the figures. They represent a set of every-day gestures and attitudes of the promenade or the women's apartment. The temper and temperament of the easy Bœotian damsels of the fourth century B.C., the mannerism they could introduce in the fling of a vail or a shawl, the familiar turn of the head, language of the fan, coquetry of a hat worn sideways, and so on, are seized by the artists to perfection. Although statuettes from Greece and Asia Minor are well known in many cabinets, yet no series so abundant and so restrictedly local, none giving the boulevard aspect of a given city in such variety yet such harmony and consistency, has ever turned up before. It is a crowd of figures in full action, sketched on the fly, attired in the fashions of a particular capital and a particular date, and leavened with a mischievous spirit unknown to antique monumental statuary. It is completely Greek, yet as different from Greek marbles as English society-verses are from English epics.

A large figure in fine condition preserves the pink hue of its square shawl or himation, with a broad border of black; the garment is seen thrown over the head like a hood, while it falls just low enough to form, with the inner chiton of different color, and the innermost tunic, a series of three regular flounces. The right arm is set akimbo under the draperies, and the lady looks over her fan with a gaze of great tenderness and provocation. The sweet waiting expression of the head turned sideways is completely narrative, and a modern artist would name the figure at once, "The first at the rendezvous." All the statues have the hair painted a warm auburn, the eyebrows marked with black, the eyes and lips distinctly tinted; on this particular specimen the rouge on the cheek and the white plaster on the face are perfectly preserved. The fan is the usual heart-shaped lotus-leaf, but here alone it is decorated with a bent-up rim like a metallic mounting. The carnation hue with which the principal garment is tinted is a preparation of cinnabar. The bare left arm holding the fan, from which the black border of this pink drapery falls in coquettish zigzags, is clasped by a bracelet of which the gilding is still perfectly evident. Another figure, seven inches high, is robed in sky-blue, a coloring derived from a silicate of copper. She leans against a slender cippus or column, her right breast bare, her head tied in a kerchief. The potter who made this image had certain habits of his own which distinguish him from the manufacturers of every other piece in the series: the vent-hole between the shoulders of the statue, instead of being square as in all the rest, is here triangular; and the square plinth or base is hollowed out along with the rest of the piece, whereas the other figures are always cemented to a rectangular slip of clay like a domino. The whitey-brown clay of which they are all made is always turned out from the piece-mould very thin and hollow, and is retouched with the tool, so that interesting differences in expression have been observed in European specimens evidently from the same mould. The forms are kept large and rather summary or imperfect, as is always the case with images intended to be completed with elaborate painting. In this respect the Tanagra statues differ remarkably from the Cesnola terra-cottas from Cyprus, with which they offer the most interesting points of comparison. The Tanagra figures, so bold and original in movement, are very broadly treated, being, as it were, the mere ground for a picture; while the Cypriote statuettes are of excessively sharp finish, because they are meant to receive a coating of stucco of a certain depth.

A lively figure is a young girl in a pointed hat, the petasos, which is put on over her hood; she flirts her short mantle out to one side as far as it will go, like a cape, and looks in the opposite direction with lively interest. Her tunic falls around her feet, and both hands are covered from the hot sun which has necessitated the hat; one arm is akimbo, and the other employed in gathering her mantilla around her as tight as possible. Another, who has lowered her head and looks out from under her brows with an expression of inimitable sauciness, has wrapped her draperies spirally as close as she could; as she is only six inches high, it looks as if she were trying by this adjustment to make herself as perpendicular and tall as possible. Her hair is parted in rays, like the lobes of a melon. Another, with right arm akimbo under her shawl, and one foot on a slight eminence, pats her knee with her fan, bends her head back, and looks up with a telling expression of waiting for an answer. Her head is kerchiefed, the wrap running down behind to a point. Her sharpness of meaning, as indicated all through her posture, is mitigated by a truly Greek softness of lips, and cheeks, and expression. Still another figure with a fan betrays a perilous knowledge of the language of this seductive implement; biting the point of it, she flutters it just before her chin, holding it up at the same time demonstratively like a writing intended to advertise a coming friend. Her sidelong movement is full of vivacity, her right arm swings freely in a kind of sling formed in her robe, and her skull-cap allows the hair to escape gracefully both before and behind.

The figures of melancholy expression are still more fascinating. One standing lady of dignified mien, hooded in her mantle, separates the hood at her neck with one veiled hand, lifting up her robes with the other from beneath, and in this muffled and bandaged condition contrives to look up to heaven with perfect grace and abandon. Another, with a thick wreath around her hair, and her draperies strained around her in a spiral, looks softly downward with bent head; she is almost the Polymnia of the Louvre, the muse who leans against the rock, only that here the figure has straightened itself up in a slight degree and the rock is unnecessary. A third, a lovely little nymph, with thin folds of gauze wrapped around and around her, and tasteful melon-like partitions of the hair, looks down from her seat in the attitude of Aubert's familiar painting of "Meditation." The sacred or divine character of the Tanagra statues, ardently maintained by M. Heuzey against almost every

other archæologist, has little to support it better than the grave or reflective air of personages like these three. They may be representations of Ceres, the Mater Dolorosa of the Greeks, in her weary search for Korê; or they may simply be hetairai in moments of discouragement. The air of softness and beauty in their faces, and the fluent suavity of their motions even when boldest, remind us of Greek goddesses perpetually; but we must not be led to attribute too superhuman a character to the loveliness of the women of Tanagra, the townswomen of Corinna.

Several of the images discovered are, however, evidently meant for divinities. One of these is a female figure in the present collection. It seems to be treated as a conception of some importance. Instead of the simple domino-like plinth, there is a pedestal of two steps, on which, nude to the waist, is the familiar goddess lifting both hands to her hair, repeated in museums with many slight variations, as the Venus Anadyomene. This Tanagra statuette, made perhaps soon after Apelles' picture in a similar pose, shows the bather lifting up a tress with her right hand, and with the left pressing to her locks an implement with a handle and with teeth or bristles, not unlike a hairbrush. It is a somewhat novel rendering of the favorite posture, a posture repeated in a whole shelf of tinted marble statuettes in the Naples Museum, and derived, like them, from an artistic prototype of inexhaustible attractiveness.

The male statues found in the Bœotian tombs are not more than one in ten. Among those in this collection may be mentioned, as one which Prof. Heuzey would assuredly call a divinity, the sitting boy, nude except for shoes and hat, and a short chlamys which spreads behind and under him like a little riding-cloak. His right hand follows the curve of the knee; from his left, as it retreats into the cloak and supports the shoulder, a roundish object dangles over the seat. Calling the object a purse, and recognizing the petasos, we can dub the image at once a young Hermes; a Hermes introduced into the receptacle of the dead, not however in his more suitable attribute as the guide of souls into hades, but in his mundane aspect as patron of the markets. The fact that the figures discovered in older Greek tombs are always divinities is certainly an argument for recognizing deities in these mortuary offerings whenever it can be done; and there is hardly any familiarity which the innovating artists of the Macedonian epoch would not take with a celestial subject. But it is rash to carry a hobby too far; the female promenaders of Tanagra are often human beyond mistake, and the male subjects are sometimes still more unequivocally mortal. Thus there is in this series a handsome statue, nine inches high, leaning on a cippus with one arm and bare torso, and resembling the Spada Pompey as it extends a large ball with its bare right arm. The ball is held, however, under instead of over the hand, being clasped in the extended fingers as if ready to be dropped; and the subject is simply an exercise of the gymnasium. Another boyish character, going out hunting, as it would appear, in a short shirt and a hat, shades his bare arm with the edge of his garment as he rests his knuckle on his hip, and looks, but for the Hermes attribute of the hat, more like an Alcibiades, the destroyer of innumerable Hermes, than like the deity he insulted.

Except, indeed, such types as the Venus here present, and the correctly-winged Cupids of European museums, the statuary from Tanagra is decidedly wanting in religious significance; an obstinate doubt, so far, attaches to the innumerable figures hatted like Mercury, or meditative like Ceres. It is as lively impressions of the contemporary life that passed before the eyes of the artists that their plastic value remains. As a rich and varied but homogeneous mass of illustrations of a Greek epoch, as a set of antique Gavarnis, so to speak, the revelations of Bœotia are inestimable. Even such a collection as this made by a single individual—the half of which we have not particularized in our enumeration—is a rare and fruitful chance for the painter or the sculptor. It will not be surprising if the archæological brushes should presently be found taking a new direction. It must have been remarked that the Tademas and Gérômes have been confining themselves principally to Roman scenes, though everybody is far more interested in the life of the Greeks, and the latter suggests far more beauty and applicability to art. The reason simply is that there are multitudes of Roman relics preserved, and the details of Roman life can be depicted with demonstrable correctness. With the Tanagra flood of familiar Greek illustrations there may come a stimulus to revive, realistically rather than conventionally, the aspects of home-life in art's true home, Greece.

MRS. FANNY KEMBLE'S

Records of a Girlhood.

"The book is so charming, so entertaining, so stamped with the impress of a strong, remarkable, various nature, that we feel almost tormented in being treated to a view only of the youthful phases of the character. Like most of the novels that we read, or don't read, this volume is the history of a young lady's entrance into life. Mrs. Kemble's young lady is a very brilliant and charming one, and our only complaint is that we part company with her too soon. . . . What we have here, however, is excellent reading. . . . She is naturally a writer—she has a style of her own which is full of those felicities of expression that indicate the literary sense."—*Nation.*

A SECOND EDITION OF THE

Life of Gerrit Smith.

By OCTAVIUS BROOKS FROTHINGHAM.

Octavo, with Portrait, cloth extra, $2.

"Mr. Frothingham has acquitted himself of a difficult task with dignity, with delicacy, and with great force of expression and illustration. He has taken a broad and generous view of the various aspects of the subject. . . . The sincerity of his literary execution is a model. The work shows no passion but a love of truth. No desire of effect, no taste for display, stains the purity of its lucid pages. . . . It exhibits qualities as genuine and substantial as the virtues of the man whom it commemorates, and forms a permanent ornament to exemplary worth."—*N. Y. Tribune.*

Hampton Tracts for the People.

Edited by Dr. STEPHEN SMITH, Gen. S. C. ARMSTRONG, Miss HELEN W. LUDLOW, and Mrs. M. F. ARMSTRONG.

Sanitary Series. No. 1. Health Laws of Moses; No. 2. Duty of Teachers; No. 3. Preventable Diseases; No. 4. Who Found Jamie; No. 5. A Haunted House. 16mo, sewed, price per number, 8 cents; per hundred, $5; per thousand, $40.

These publications are strong and condensed statements of the fundamental laws of health, with illustrations of the results of breaking these laws, and advice as to the best and easiest way of living in obedience to them. They supply carefully-prepared information upon all points connected with physical life, as cleanliness of the person and house, ventilation, drainage, care of children and invalids, preparation of food, etc. The plan of the series, and these first numbers published, have been cordially endorsed by the AMERICAN SOCIAL SCIENCE ASSOCIATION.

New England Mutual Life INSURANCE COMPANY,

POST OFFICE SQUARE, BOSTON.

AMOUNT INSURED, ... $57,000,000.

This institution transacts business under the Statute of April 10, 1861, known throughout the United States as the

MASSACHUSETTS NON-FORFEITURE LAW.

The following table shows how long, by that law, a policy continues in force, one or more annual cash payments having been made, and then payments having been stopped. The table shows the extra insurance prescribed by the law, additional to the years during which payments have been made.

FOR QUEENSTOWN AND LIVERPOOL.
Sailing from New York every Wednesday. From Boston once a week.
RATES OF PASSAGE:
CABIN—$80, $100, and $130, gold, according to accommodation. Return tickets on favorable terms.
STEERAGE—$28 currency. For freight or passage apply to
C. G. FRANCKLYN,
Bowling Green, New York.

NORTH GERMAN LLOYD STEAMSHIP COMPANY

FOR SOUTHAMPTON AND BREMEN.
The Steamers of this Company will sail every Saturday from Bremen Pier, foot of Third Street, Hoboken.
RATES OF PASSAGE TO LONDON, HAVRE, AND BREMEN.
First Cabin, $100; Second Cabin, $60 gold. Steerage, $30 currency.
For Freight or passage apply to
OELRICHS & CO., AGENTS,
2 Bowling Green

CHOCOLAT DEVINCK,

175 RUE ST. HONORE, PARIS.
"HORS CONCOURS."
Sweet, Vanilla, and Fancy Chocolates of all kinds, and Pure Cocoas. Used in the principal Hotels of New York, and for sale by leading Grocers and Confectioners.
WHOLESALE DEPOT, 62 PINE STREET.
E. L. LENTILHON. J. J. CAUCHOIS, Sole Agent.

Pratt's Astral Oil.

PERFECTLY SAFE.
Especially adapted for use in the St. Germain Student Lamp.

CHAS. PRATT & CO.,
Box 3050. NEW YORK

The Nation.

NEW YORK, THURSDAY, FEBRUARY 6, 1879.

The Week.

THE great question of "the New York appointments," to which the senior Senator from this State has devoted himself almost exclusively during the past year, has at last been decided. As soon as the nominations of Merritt and Burt in place of Arthur and Cornell were sent in, a fierce controversy opened between the Secretary of the Treasury and Mr. Arthur. The Secretary was called on by the Senate for his reasons for Arthur's dismissal. He gave them in a long letter, and they were, in substance, neglect of duty and connivance at abuses. Mr. Arthur answered and the Secretary replied, but the charges and countercharges have now little interest for the public. The shock of battle in the Senate was postponed from last week, and in the interval the excitement among the henchmen was painful to witness. On the one side was their "gifted leader," well combed and neatly attired, his brain full of the facts in the case, his coat-pockets crammed with damning letters, surrounded by piles of law-books, a curl of scorn on his lips, and his torso bursting with "sarcasm." On the other was the shrewd and wily Secretary of the Treasury, working as he has never worked before, pursuing the Senators to their lodgings and constraining them to support the Administration for this once. That heroic body of men, the Republican majority in the New York Legislature, were, in the meantime, so appalled by the preparations for the fray that forty-six of them signed a petition that Merritt might be confirmed, and thus prevent civic convulsions and promote harmony. Several of them afterwards were so frightened by the prospect of their leader's wrath, however, that they telegraphed to him that they were sorry for what they had done and hoped all would be forgiven.

On Monday the opposing forces closed in deadly conflict, and the reports which have crept out represent the Conkling onslaught as one of the most shocking scenes of "sarcasm" and "scorn" ever witnessed in a legislative body. The real havoc he wrought in the Administration ranks, however, was effected with private letters, which showed that the President and members of the Cabinet had insisted on appointments in the Custom-house for political reasons; that Judge Bradley had to have a son provided for in this way—for "manifest reasons"; and that Mr. J. Q. Howard, the author of a 'Campaign Life,' had to be furnished with a deputy-collectorship in consideration thereof. Sarcasm, however, was in vain, and the nominations were confirmed, that of Merritt by 33 votes to 24, and that of Burt by a majority of eighteen. The result has caused profound consternation among the henchmen, who are shouting frantically for "harmony," but we think the country and the Custom-house will be the better of it. Only fifteen Republicans voted with the Administration.

Except to confirm the New York appointments the Senate has achieved little during the week. When Mr. Edmunds's resolutions came up at last on Thursday, the mover declined to speak to them, saying that all he wanted was a vote; which at once invested the whole proceeding with an air of buncombe. Senator Morgan, however, undertook a one-sided debate, arguing from the ground of the Democratic counter-resolutions, and saying some things that were true and others that, whether true or not, were not pertinent, and on the whole failing to make a very serious or profitable occasion of it. Senator Bayard spoke more coherently and effectively on the same side on Tuesday, and Mr. Edmunds argued that the Constitutional power of the Federal Government to protect citizens was in aid of local self-government. The House has resounded with the noise of three Mississippians, Messrs. Chalmers, Singleton, and Hooker, in retort of Gen. Bragg's well-considered rebuke to Southern raids on the Treasury. From Mr. Chalmers's remarks it appears probable that he was the very offender whom Gen. Bragg had in mind, for he boldly stood up for what he called equal distribution of appropriations from the National Treasury, and confessed that he had long ago given warning of Southern desertion from the Democratic ranks in case the tap was cut off. Mr. Mills, of Texas, on the other hand, was for putting an end to the payment of all claims. The House passed on Thursday the Post-Office Appropriation Bill; on Friday voted down the Fairfax Seminary war-claim by 121 to 89, the yeas being nearly all Democratic; on Saturday it refused to take up the Army Reorganization Bill, and began the discussion of Mr. Hewitt's substitute in the shape of the Army Appropriation Bill, to which Mr. Banning offered the other as an amendment. On Monday, being still in a negative mood, it refused (130 yeas to 98 nays) to suspend the rules to oblige Mr. Wood, who wished the Sugar Bill made a special order for February 8; or (140 yeas to 81 nays) to pass a bill authorizing the issue of $40,000,000 four per cent. bonds to meet, as far as this amount might go, the extraordinary demand on the Treasury of the Arrears of Pensions Bill—a sign of returning sanity; or (101 yeas to 136 nays) to pass the bill offered by Mr. Whitthorne, of Tennessee, by which the Treasury would be compelled to pay $100 in gold for every $100 in silver presented to it—again a most healthful indication.

The Army Appropriation Bill contains a number of sections providing for a gradual reduction of the number of officers on liberal terms without deciding upon any final maximum establishment, that being left for a future Congress. The most, and indeed only, serious objection to the plan of the bill is that it departs from the uniform horizontal reduction in all grades and arms as was first announced to be the draft Mr. Hewitt presented to the Committee. It now discriminates in favor of the Corps of Engineers by excepting it alone from the stoppage of promotions, and thereby reawakens all the jealousies and contests which had virtually been allayed by the published simple scheme of equal and common hardship to all individuals and classes. Any argument for preserving the rank and numbers of the Engineers will apply equally to other staff corps, and legislation disregarding that fact becomes partial and special.

The report of the dissenting half of the Committee on the Indian transfer question has been published. It reviews the history of the Indian service while under the control of the War Department, and shows that during that period many evils and abuses grew up, while almost nothing was done towards civilizing the Indians. From a large amount of testimony taken it appears that army officers, as a rule, object to the transfer, and the Indians almost unanimously oppose it. The Committee cite a number of instances in support of the belief that the Indians can be civilized, and recommend that the present policy of reform and improvement be continued. They also urge that the civil law of the United States be as far as possible extended to the Indians, with a code of laws adapted to them, defining crime and providing a judiciary. The salaries of agents should be sufficiently liberal, and the tenure of office during good behavior sufficiently secure, to enable the Government to obtain the services of honorable and able men who can take their families to the agencies and support them there; at the same time the punishment of offenders in this service should be prompt and severe. Such a policy has been pursued with the best results under the present administration, which is considered as economical and as efficient as that of the War Department could be. Without urging immediate legislation the reporting members of the Committee recommend that the entire government of the Indians be placed under a separate and distinct department, its chief to be a member of the Cabinet. In

case of disorder or threatened hostility on the part of any tribe the President should be authorized to place such Indians temporarily under military control, there to remain until peace is secured. A bill which accompanies the report provides for this measure, and also authorizes the President to detail officers of the army as Indian agents or inspectors.

The investigation of the Potter Committee into the cipher telegrams is a melancholy business. They found out in the first two or three days all there was to find out, viz., how the Democratic despatches came into the hands of the Republicans and of the *Tribune*. There is nothing to be discovered about the Republican despatches, because they are not in existence. Mr. Brady produced those sent by him from Florida, which he had abstracted from the bundles in the Committee room, but they contained little but "words of cheer." One of them, however, threw amusing light on his statement before the Committee that he went to Florida to "see a fair count." In it he accuses General Barlow, who also went to "see a fair count," of "treachery" for "recommending contrary to our [Republican] interests." In other words, seeing "a fair count" was advising the Returning Board to count for Hayes, and any Republican whose arithmetical views did not permit him to do this was a traitor. Mr. Brady drew $300 from the United States Treasury for work in the Post-office at Washington while he was one thousand miles away watching Barlow and a State Returning Board; but he acknowledged to the Committee that "some of the Civil-Service Reformers might object to this." It would be just like their impudence if they did.

We believe a sub-committee is coming on to New York to examine Mr. Tilden and give him a chance to vindicate himself by showing that he knew nothing of the operations of Pelton and the rest. But he cannot show this to anybody but admiring friends, who are willing to take his own word as conclusive. There is only one way of proving to the incredulous that you did not know a certain thing on a certain day, and that is by showing that it was physically impossible or physically difficult for you to know it. Mr. Tilden may swear he never heard of Pelton's telegrams, and Pelton that he never told him of them, but nobody who now distrusts either of them will believe it. The only way out of the scrape is to prove an alibi or brain paralysis. If Mr. Tilden could show that he was in Europe or insensible during the canvass, he would now be able to confound his enemies; but having been in the same house with the ingenious Pelton, the case is hopeless. We must say that it is well that such is the case. Nothing at this moment needs to be more rigidly enforced than responsibility for Wicked Partners. The Partner and the Good Man must be held, for all purposes of moral judgment on their acts, to be one and the same person, unless the Good Man can prove that he was separated from the Partner by the sea, or by a chain of mountains untraversed by the telegraph. There is one thing the Committee ought to enquire into closely, and that is the great campaign miracle recorded by the *Tribune*, when the lightning was stopped on the wires to prevent the bribery of the South Carolina Returning Board. This is the most remarkable event of our time, and has attracted singularly little attention either from Roman ecclesiastics or scientific men, to say nothing of politicians.

The Chicago *Tribune* is as faithful a Republican paper as there is, and perfectly sound on the Southern question. Its account, in a recent issue, of Logan, the new Senator from Illinois and former member of the "Senatorial Group," is, therefore, very entertaining. After speaking of the shame caused in Illinois when he was last in the Senate by his ignorance, his illiteracy, his Crédit-Mobilier operations, and his back-pay vote, the *Tribune* says:

"He was opposed to all reforms in government; he was the embodiment of the worst phase of machine politics, and helped to bring scandal and reproach upon Grant's Administration; a majority of his appointments turned out to be corrupt and faithless, a number were indicted, some fled the country, others escaped through flaws in the law, many passed under a cloud, and some, who are out on bail, have yet to be tried."

The appointees were, in other words, worthy of their "influence," as the office-seekers call the man who gets them a place. To appreciate all this thoroughly, however, we must remember that Logan is one of a set whom the party is actually sending back into public life as a remedy for Southern disorders. Those who wish ill to the party can desire nothing better, for nothing is surer than that "the Group" will prepare the people not for Grant, as some of the managers fondly hope, but for "anything to beat Grant."

There are some signs that Mr. Carpenter, who has been returned from Wisconsin, has learned wisdom in his retirement. He is an abler man than any of the others, and it is to be remembered to his credit that he strenuously opposed the Louisiana iniquity of 1872. He has owed his election to the hostility of the Germans to his predecessor, Mr. Howe, which may help to keep him on the right track. Mr. Howe's fate is curious. He might have avoided it if he had not been seized with the then current delusion, that the thing to do after the new Administration turned the cold shoulder to the party leaders was "to have a whack at Schurz." So he composed "an effort," in which he devoted all the powers of his mind to showing that Mr. Schurz was born a German, that he rose against arbitrary government in his own country and afterwards emigrated to this, and had held high office here. He somehow had got into his brain that when the country had heard this it would be appalled at Schurz's rascality. But the only feeling excited by the speech among native Americans was one of simple curiosity about Mr. Howe's mental condition, while, as might have been expected, it enraged the Germans. The result is that he returns to private life. We would now recommend his visiting Germany and examining the exact spot where Schurz was born. He will find that it is not half as queer a place as he thinks it is, and will see in the region around a considerable number of men who will compare favorably even with himself.

The sub-committee for the settlement of the Virginia State debt met the representatives of the bondholders on Saturday last, and a liberal proposition was made by the latter, of which the following are the important features: Bonds are to be issued dated January 1, 1879, the principal payable forty years thereafter, bearing interest at the rate of three per centum per annum for five years, four per centum for twenty-five years, and five per centum for ten years, coupons on the bonds and certificates of interest to be receivable for taxes and other debts due the State. All due and unpaid interest up to January 1, 1879, is to be funded at the rate of fifty cents on the dollar, and a sinking fund established for the final payment of the principal. The sub-committee decided to submit the proposition to the Joint Finance Committee without recommendation. It is important that a settlement in this matter should be reached at once, both for the credit of Virginia and as an example to other Southern States in similar difficulties. The only persons in Virginia hostile to this proposition will probably be the "readjusters," who do not wish to pay more than three per cent., demand that the bondholders should yield their only security, the tax-paying coupons, and clamor for "concessions." The settlement offered by the State's creditors is a liberal one, and any further concessions ought to come from the other side.

The financial prospects of other States burdened with debt are less reassuring. The interest due on the debt of Louisiana might be easily met if the assessments on property were made with accuracy, and their collection enforced. The city of New Orleans is obliged to supply almost two-thirds of the State revenue, while property in the country pays little or nothing. The country has a majority in the Legislature who show no disposition to allow an honest assessment. The tendency in Tennessee is decidedly toward repudiation. A resolution recently introduced into the State Legislature to provide for the honorable adjustment of the debt by the

acceptance of a compromise of fifty cents on the dollar offered by the bondholders was tabled by a vote of fifty-one to thirteen. The State tax of Tennessee is only ten mills, while in eight other Southern States the average rate is eighty mills on the dollar. About half of this average rate would enable the State to meet the interest on the proposed compromise; but there seems to be no desire among the people of Tennessee to fulfil their obligations. The same sentiments prevail largely in North Carolina. The Governor thinks it is out of the question to pay part of the debt at its face value, and that there is no moral obligation to pay the rest. In a leading article the Raleigh (N. C.) *Observer* says "it is pained to learn that some Virginians must suffer on account of the inability of North Carolina to meet her obligations," but "has no sympathy with the holders of bonds who contributed to the bankruptcy of the State by taking part against her in the late war, or who bought the bonds they hold subsequent to the war, and on speculation." In short, in the States which have suffered least from the carpet-baggers as well as in those which have suffered most, the sense of honor is for the moment nearly extinct, and common prudence has not yet come to take the place of it.

During the week the Bank of England reduced its posted discount rate from 4 to 3 per cent., and in the open market prime three-months discounts could be obtained at 2 to 2½ per cent. There was not a sufficiently active demand in London for United States 4 per cents to offset the return movement of 5-20 6 per cents to this country; accordingly, the market for sterling bills here was strong, and rates advanced half a point nearer to the gold-exporting point; it is not feared, however, that gold will be exported. There was some abatement during the week in the demand in this country for United States 4 per cents, although enough were sold to warrant the Treasury in giving notice of redemption to the holders of $20,000,000 more 5-20s of 1867, which raises the total amount so notified since Jan. 1 to $170,000,000. The first month of specie payments resulted in a gain of about $45,000 gold at the New York Sub-Treasury, the principal office for presenting legal-tender notes for payment. The month was one of extraordinary activity at the Stock Exchange, more than seven millions of shares and stocks (having a par value of over seven hundred millions of dollars) having been dealt in. During the week there was a continuance of the downward reaction in prices which had begun when we last wrote. Money is still extremely easy at 1½ to 3 per cent. on collateral; and in the latest statement of the Treasury the following item appears among the assets: "Deposits held by National Bank depositaries, $166,351,141." This item is, to a large extent, a fiction of book-keeping made necessary by the refunding of the public debt. Silver in London fell to 50*d.* per ounce, and there remains. At the close of the week the bullion value of the 412½-grain dollar is $0.8430.

The result of the determination of the French Ministry to carry out the programme of the Left as regarded the changes in the army, the judiciary, and the civil service was that Marshal MacMahon sent in his resignation, saying he could not sign the proposed decrees, and that there was no use in trying a new ministry, as it would make the same proposals. His letter of resignation was received by the Chamber in profound silence, and they immediately proceeded to vote in joint convention for a successor for the term of seven years. Out of the 713 Senators and Deputies present 670 voted, and M. Grévy was elected by 536 votes, General Chanzy receiving 99. Marshal MacMahon, who has throughout behaved with great dignity, at once called on him and congratulated him. The result was received with great rejoicings throughout the country. M. Grévy's vacant place as President of the Chamber was then filled by the election of M. Gambetta by a vote of 405 to 314. The resignation of the Dufaure Ministry followed soon after, M. Dufaure pleading age and the desirableness of meeting the new situation with new men. A new one has been organized under M. Waddington, with Le Royer, a Senator, as Minister of Justice; Marcère as Minister of the Interior, an office which he also filled in the Jules Simon Ministry; Jules Ferry as Minister of Public Instruction, and Lepère as Minister of Commerce, he having been Under-Secretary in the Ministry of Agriculture under the late Ministry, and Admiral Jauréguibberry as Minister of Marine. The only very new man among them is Lepère, who is one of Gambetta's closest adherents, and in a certain sense represents him. The change has been received very favorably abroad, M. Waddington's name being a guarantee of peace. In fact, the only cloud which now appears in the Republican sky is the enormous weight of the centralization in Paris. Whether this will not cause every Ministry to break down under the legislative pressure remains to be seen.

The most striking piece of news from Europe besides the change of Government in France is the appearance of what seems to be the veritable Black Death of the Middle Ages on the eastern border of Russia, killing, it is reported, ninety-five per cent. of those whom it attacks, and alarming the Russian Government so much that it is using large bodies of troops to form a sanitary cordon one thousand miles long, and is burning the villages and the clothing of the inhabitants in which it has appeared. It is reported to carry off its victims in from four to ten hours. In the town of Vetlianka, in the government of Astrakhan, in which it first appeared, it slew 400 persons at once out of 1,700, and the rest fled, leaving the dead unburied. At Prishibe it killed 520 out of 830 inhabitants in two weeks, and it spreads even in thinly-settled localities with great rapidity. In one quarter it advanced thirty miles in four days. The alarm has not only passed through Russia but reached Germany, where rigid quarantine precautions are being taken on the frontier.

The Pope has published an Encyclical—we believe his first—and it is not pleasant reading for those who, like Colonel Forney, enjoy "the bright side of human nature." He says there is a "mortal plague" running through human society; denounces the Socialists and Nihilists, on whom he lavishes all the Papal wealth of invective, and finds the source of their detestable errors in the Reformation, which first brought in the present atrocious liberty of opinion; warns princes and rulers that the present spirit of resistance to their authority is due to their own hostility to the Church; repudiates the principle of equality, and preaches passive obedience to earthly governments, except where something is commanded in direct hostility to natural or divine law; treats sacramental marriage as one of the foundations of social order, and declares that it is the Church only that can enforce the performance of the various duties appertaining to the domestic relations; and he closes a most dismal review of the condition of mankind by a solemn appeal to all governors and peoples to take the Church for their mistress, as the only refuge from misfortune, both present and to come. The allusions to Pius IX. and his Encyclicals which the paper contains seem to indicate that the present Pope is not very far from adopting the doctrines of the Syllabus, though the style of all Papal documents is such that one hardly knows how much is merely the trumpet-blast of warning and how much formal assertion.

The Bulgarian Parliament, or Assembly of Notables, as it is called, was to assemble at Tirnova on December 27. It consists of 290 members, of whom seventy-five are officials and thirty-five ecclesiastics, including the Turkish Mufti and the Jewish Grand Rabbi. The first business of the Assembly is to elect a prince, but who is the most likely candidate is not known. He cannot belong to any reigning house, and will probably be picked out by Russia. One of the most striking facts brought out by the election of the Assembly is the diminution in the Turkish population in the Principality, who are now said not to number over 100,000, the rest—about 300,000—having disappeared during or since the war, a result which, as regards the future, is certainly not to be deplored, particularly as the emigration has included a colony of Circassians whom the Porte some years ago planted in the midst of the Christians, and who never abandoned their predatory habits.

WHO IS RESPONSIBLE FOR THE CUSTOM-HOUSE?

THE President's Message to the Senate touching the New York Custom-house appointments contains very sound doctrine, and, in fact, goes to the root of the whole question of civil-service reform. He says the New York Custom-house collects over two-thirds of the whole customs revenue of the Government; that, therefore, the whole country is interested in having it managed on business principles; that it has not been managed on business principles, because its managers have for years been also the managers of the Republican party in this city and State, and have, therefore, "regarded the duties of the offices held by them as of subordinate importance to their partisan work," and have made the Custom-house "a centre of political management." This is all strictly true. It is one of the notorious facts of the day. It is true not only of the Custom-house as managed by Mr. Arthur, but the Custom-house as managed for a great many years by Mr. Arthur's predecessors of both parties. The Custom-house has not for forty years been conducted as "a business office on business principles," to use President Hayes's language, but as a political "headquarters" with a business office attached. The evil consequences of this have been, however, more apparent since the war than before, owing to the enormous increase of business. This being the case, the controversy which has been for some time raging between the late Collector and the Secretary of the Treasury has really not been over the question whether Mr. Arthur's management was the best that could be secured, but whether it was so bad as to warrant the interference of the Administration. From the purely business point of view there is not, and never has been, any doubt about his unfitness. No private firm would for one month retain in charge of weighty interests two persons whose minds were as much occupied with other things than the business as Messrs. Arthur and Cornell—persons, for instance, who were so deeply concerned night and day about primaries and conventions and elections and "claims." If a private firm found its cashier and bookkeeper leading this sort of life, the head of it would not suffer himself to be questioned as to the exact extent to which the officers neglected their business. He would refuse to say in what particular and to what extent the house was damaged by their political activity. He would dismiss them on general principles of human nature. He would inform them that they were not the kind of men he wanted, and that, without going into details, he knew as a matter of business experience that the affairs of his house could not be well managed by persons who not only did not make them their chief interest, but who took an intense and absorbing interest in something else.

All the investigations into the management of the Custom-house, therefore, have been really enquiries into *the degree* of its badness. Their object has been to ascertain not whether it came up to the business standard, but whether its abuses were so great and flagrant that political considerations would have to be disregarded in order to reform them. Mr. Arthur's defence has been that there was not as much bribing and cheating as people said there was, and that he passed more hours in his office than some evil-minded persons tried to make out; that anyhow his administration would compare well with Mr. Murphy's or Mr. Grinnell's or Mr. Schell's, and so on. He would not venture to defend himself in this way if his employer were a private firm, because he would know it would avail him nothing. Nor would Mr. Cornell venture to tell a private employer who complained of his absenting himself too much for political work that he was interfering with his "personal and political rights," because he would know that any such observation would lead to his instant dismissal.

Those, therefore, who accept Mr. Hayes's view of the nature of the Custom-house, and are aware of the position in politics hitherto occupied by the Collector of the Port, will have no difficulty in coming to the conclusion that the President is right in saying that Mr. Arthur is not the man for the place, and will be disposed to treat the discussion between him and Mr. Sherman over the more or less of Custom-house abuses as really extraneous or superfluous. There is one other argument in support of the President's position which is not in our own eyes a very strong one, but which as against the class of politicians with whom the President is contending is fairly overwhelming. There is no ground on which Stalwarts have so bitterly opposed anything like the introduction of fixity of tenure into the civil service as the ground that it would weaken the responsibility and tie the hands of the appointing officer if he had to give reasons for dismissing a man. "Give the head of every department," they say, "complete liberty of choice and removal, and then hold him to a rigid accountability, and you will have the best civil service on this planet." This rule if good for anybody is good for the President, and if good for any portion of the Government service is good for the New York Custom-house. We are, therefore, surprised to hear from Stalwart mouths fierce denunciations of Mr. Arthur's removal as long as it cannot be shown that he has committed any criminal offence. In fact, if their theory of the management of the New York Custom-house were to become a permanent part of our system of administration, it would soon be as difficult to hold anybody responsible for the proper collection of the duties as for the state of the weather. If we were to judge from many of the articles we read on the subject, we should come to the conclusion that the last persons whose opinions about Mr. Arthur's qualifications were of any consequence were his immediate superiors, the President and the Secretary of the Treasury, and that the persons to whom he was really answerable were Senator Conkling and an indeterminate number of politicians and newspaper editors. A custom-house organized on this basis might afford some beautiful examples of the working of pure justice, but it could hardly remain very long an efficient instrument for the collection of revenue.

Of course we know very well all that can be said by way of showing Mr. Hayes's inconsistency in applying these rules to his dealings with the New York Custom-house when he has violated them freely in his own practice elsewhere. The best portion of his supporters will read with genuine pain the revelations made in the Senate on Monday about his mode of using the Custom-house for the reward of his personal followers. Considering the professions with which he solicited and obtained the votes of reformers, his forcing the author of a 'Campaign Life' on the Collector of this port as a deputy was a performance which it is difficult to characterize in moderate language. There is no denying that if you insist on dismissing men from office for too great political activity you must be careful not to appoint them to office for political services; and that Mr. Hayes has left himself, to a certain extent, at the mercy of the Stalwarts, and incapacitated himself for anything like complete reform of the civil service, by distributing offices wholesale among the large and by no means respectable body who took part in the canvass and "count" by which he obtained the Presidency, is only too true. This, of course, furnishes the Senators whom he is trying to deprive of their patronage an excuse for resisting him which it is not easy for *him* to dispose of. But the public has no real interest in this quarrel. It gains nothing by driving Mr. Hayes into a corner and exposing his errors. It is not his private affairs that he is managing, but those of the country, and in so far as he manages these rightly, or calls for what we must all acknowledge to be a reform as far as it goes, it is not very wise policy for those who are interested in reform to keep telling people not to mind what he says. If it be a good thing to change the management of the New York Custom-house, it is good whether Mr. Hayes acted rightly or not a year ago in making other appointments, and should be so taken. The defeat of Mr. Conkling, whatever be the merits of the nominee who has been confirmed, or of the Collector who has been dismissed, is an effective blow struck at what is worst in the present system. It will rob him of the allegiance and confidence of scores of "henchmen," and reduce him before long to the sorry plight of having to maintain himself in public life by useful industry and by application to serious public questions. In all the controversy, too, both sides have been forced to acknowledge and rely on the principle that efficiency and fidelity in the discharge of official duty constitute the sole title to retention in the public service. All this is a great gain

for the country—so great that we can well afford to disregard the motives of the disputants.

THE NEW REGIME IN FRANCE.

IT seemed unlikely a week ago, even, that the French Republic would be put to so severe a test as the election of a new President close on a change of Ministry, and still more unlikely that it would bear the strain with so much ease. But Fortune seems to smile on the new régime as it has never smiled on any preceding one. Marshal MacMahon's throwing himself into the hands of the Reactionists on the 16th of May of last year bore at that time the appearance of a serious misfortune and danger, as he enjoyed an amount of prestige which no other military man possessed. He was the only one of the older generals who came out of the war with a shred of reputation. In fact, only two even of the younger men—Generals d'Aurelle de Paladines and Chanzy—won any fame from it whatever, and the former of these is dead. All the old marshals of the Empire, except MacMahon, either gained nothing from it or were fatally discredited by it; and whether even he would have been able to lift up his head after the pummelling he received from the Crown Prince at Reichshofen, if he had not had the good fortune to be badly wounded at Sedan, is more than doubtful. But this wound relieved him most opportunely from all share in the responsibility for the surrender, gave him the air of one of the martyrs of the war, and revived in his favor the memories of the Italian campaign in 1859, which was after all the one brilliant episode in the history of the Empire. He was the hero of Magenta, which ought not to have been a victory but was one; and seen from afar, amid the smoke and desolation and disgrace of the German invasion, its glories were heightened, and people of all parties turned to the man who won it, in his new character of the "glorieux blessé de Sedan," as the last of a grand generation, and the only really surviving "Marshal of France." The news, therefore, that he had put himself in the hands of the Broglie-Fourtou combination was very serious for the Republicans, because they could not estimate with any exactness the amount of hold he had on the French public, and the knowledge that anybody had of the condition of public opinion a year ago was still very vague. It turned out, however, on experiment, that he had no political weight whatever; that the reactionary party could not conjure with his name, and that the country did not rely on him for the preservation of "order." This discovery was an immense gain and relief to the Republicans, because it proved that there was no military name or reputation in France which kindled the imagination of the voters; or, in other words, that the army was no longer to be dreaded. It of course also greatly diminished his value in the eyes of the Conservatives, but they would probably have still stuck by him if he had not surrendered somewhat tamely to their adversaries. When this occurred, more than half the difficulty or danger of getting rid of him altogether disappeared, because it left him absolutely without political friends. The other half he removed himself, it now appears, by his not ungraceful resignation. He could not make himself the instrument of the new reforms in the Administration. The ties of comradeship are with most old soldiers stronger than any other, and when he was called on to sacrifice old army friends to political necessities, he took himself with a good deal of dignity out of the way.

The election of M. Grévy, however, by an overwhelming majority of the Chambers in joint convention is something more than the election of a new President. It is the beginning of a new régime the like of which France has not yet seen. By it the French people have, for the first time, put a man in the chief executive office who has no pictorial effect. We spoke two or three weeks ago of the strength of the French tradition which requires the chief of the state to be a soldier, either professionally like MacMahon, or *ex-officio* like the late Emperor—and, indeed, like all kings—that is, a man who is entitled to wear a uniform, and is in theory, at least, capable of commanding an army in the field. M. Thiers was apparently an exception to this rule; but M. Thiers, by the length and lustre of his past, did touch the imagination of the present generation; and to these claims on their respect he added others derived from his negotiations with the Germans. Then, too, he had done so much with his pen to glorify the French army that he possessed a kind of semi-military reputation, and, in fact, plumed himself a good deal on his knowledge both of strategy and tactics. He accordingly came in more as a relic of old greatness and glory than as a statesman simply; but, even as such, he more or less startled the public during his administration by reviewing troops and appearing at state ceremonies in a black coat.

M. Grévy takes office as a politician simply. There is nothing striking and picturesque in his career. It is that of a plain, laborious, and upright publicist who has done well in various positions whatever work was given him to do. He is probably, on the whole, made of more commonplace material than any man France has yet seen in such a position. He has none of the literary *éclat* of Louis Philippe's ministers, nor has he the court behind him from which both they and those of the Second Empire borrowed much of their dignity. He will, in fact, for the first time present to the country the spectacle of a chief of the state who is simply a functionary like another, paid for performing certain duties, and will thus completely obliterate the monarchical halo which still lingered around MacMahon. When he takes up his abode in the Palais Elysée, it will be not as a personage with a semi-sacred character cutting him off from the rest of his countrymen, and investing him with mysterious and indescribable titles to respect, but as a public servant paid for doing certain work for a limited term. There are countries in which this change would not be altogether beneficial in its effects; but in France, strong as the passion for equality is, and completely as royalty has been uprooted, the "pouvoir exécutif" has remained surrounded by a somewhat superstitious reverence which has been one of the great obstacles in the way of real political progress, both by making it an object of lawless ambition, and deluding the possessor of it as to his real powers and duties.

The election of M. Grévy, too, has provided a happy solution of the Gambetta problem, which the resignation of M. Dufaure threatened to make more serious than ever. As long as Dufaure remained in office, the anomaly of Gambetta's position was kept somewhat out of sight, as the Dufaure Ministry was, to all outward appearances, the product of the victory in October over the Broglie-Fourtou reactionists. But a new Ministry would have been considered, whether truly or not, Gambetta's creation, and the creation of ministries by a man who did not himself take office would have been in a republic a scandal as well as a danger which it was by all means desirable to avoid. His election to the presidency of the Chamber in place of M. Grévy is an escape from the difficulty. It puts him in office at last, and in a very conspicuous office, for the Speaker in France is a good deal more than the mouthpiece of the House. He deals out doctrine, reproof, and instruction to the orators on his own motion, and in heated discussions is constantly in the *mêlée* as the defender of dignities and principles against unseemly assaults. Here the country will get used to Gambetta as the friend and defender of the thing that is, and be prepared for his succession to the Presidency when the time comes.

Any alarm that has been excited by the proposed removal of officials of monarchical antecedents will doubtless soon pass away. The fear that has found expression in some quarters that it foreshadows the introduction of the American "spoils" system, and will lead to a clean sweep every time there is a change of ministry, is not justified by the changes now proposed. That a government can be well and efficiently administered through agents belonging to a party opposed to that in power is well known; but no government can be well and efficiently administered by agents who deny its right to exist, and are eager for its overthrow and the substitution of another form. In other words, a republic cannot be carried on by monarchists, or a monarchy by republicans, or a constitutional monarchy by the lovers of a pure despotism. If the Republic is to last in France, its paid servants must be men who believe it to be the best kind of government, and who desire its success and are jealous of its fame, and any minister who put up with servants who sighed for the

Empire, or believed in the divine right of the Comte de Chambord, would be guilty of a sort of treason. Precautions on this point are all the more necessary in France because of the great concentration of powers in the Government, and the vastness, complexity, and rigidity of the machine through which they are exercised.

Correspondence.

THE BRAZILIAN STEAMSHIP SUBSIDY.

To the Editor of The Nation:

Sir: In Mr. Thurber's letter in your issue of 30th ult. he does not exhaust his illustrations.

He instances two grocers competing for a certain suburban trade. One puts on a wagon and a smart driver, and compels his neighbor to do likewise. Therefore (is his moral), if our manufacturers wish to compete with those in Europe, our Government must subsidize a line of steamers. But Mr. Thurber's enterprising grocer did not ask the Government to subsidize his wagon; he ran it himself, and Baltimore begs New York to imitate him in his independence.

Yours, T. E. Carson.

Baltimore, Feb. 1, 1879.

To the Editor of The Nation:

Sir: It appears to me that Mr. F. B. Thurber's argument (in the *Nation* of January 30) in favor of the Brazilian steamship subsidy is fatally defective in this, that it does not show how much money, if any, Mr. Roach is now losing in default of a subsidy, and how soon, therefore, the line will be withdrawn if the subsidy is not granted. Mr. Thurber's argument goes to show that such a line is wanted. The answer is that the line is already in operation, has been running nearly a year, and that before it was started there was another line (an English one, I believe) on the same route. I have not seen any statement going to show that Mr. Roach's line has been operated at a loss. On the contrary, the newspaper accounts of its success from month to month have been somewhat glowing. I presume nobody would contend that money should be paid out of the Treasury to Mr. Roach because he has established a successful line, but that it should be paid, if at all, because he has started an unsuccessful one. But just here all the advocates of this subsidy stop short. They do not tell us whether the money is wanted to make good a deficit in the balance-sheet of the concern, or merely for purposes of general encouragement. Doubtless we should all feel encouraged if we had a little more money.

New York, Feb. 3, 1879.

INTER-STATE EXTRADITION.

To the Editor of The Nation:

Sir: In some remarks in the *Nation* of January 23, upon the article on "Extradition between States" in the *American Law Review*, you say that I seem "to think that there is no remedy for the present chaotic condition of things save through the action of the States; that Congress cannot interfere." A reference to the article will show that in the passage referred to, a part of which is quoted, there is no allusion to the matter of legislation, nor is there any reference to that question in the article. The discussion assumes the law in its existing shape as a finality throughout. It is too well established to need further illustration that as the law now stands the question of executive discretion, so-called, cannot be brought directly before any court in the ordinary course of judicial proceedings. In view of that fact, the suggestion contained in the article was made, that under such a provision as the constitution of Massachusetts contains, authorizing the governor to require the opinion of the State Supreme Court on "important questions of law and upon solemn occasions," a governor honestly desirous of executing the mandate of the constitution in accordance with his oath might obtain a rule for his safe guidance, having for him and for his State the absolute force of law. It is worth mention that the writer has since been more than once assured, by those presumably familiar with the ways of thinking of State executive officers, that the proposition is quite too simple to catch the average State governor. The reason given is that, having found in the complicated relations of the two governments, both of which a governor swears to support, this solitary chance for the exercise of arbitrary and irresponsible power, he would be supremely foolish to submit the question of his duty to a tribunal authorized to lay down the law for him by a method which would carry a sanction with it. By an accidental circumstance he can make himself in this particular his own interpreter of the Constitution. It is of small consequence to him that by a primary principle, taught even in the schools, the Federal Supreme Court is the sole interpreter of that instrument, and that not only that court but all other respectable courts, which have had an opportunity to express an opinion, have declared an interpretation diametrically opposed to his own. That circumstance indeed supplies an additional motive for abstaining from soliciting a decision which would bind him. Under the present law he cannot be compelled to adopt the construction of the courts any more than to execute the provision at all, and so long as he is careful not to submit the question to the judges he may exercise his accidental prerogative with impunity.

As to a remedy for this preposterous state of things by legislation, there can be little doubt that Congress has the necessary power, though the subject is not altogether free from difficulties. The right of Congress, as opposed to the States, to provide for executing the constitutional clause was declared by the Supreme Court in Prigg *v.* Penn (16 Pet. 539), which pronounced the Act of 1793 constitutional. Congress can, therefore, repeal that Act, and make other provision for the case. The only condition of such legislation is that it be in harmony with the clause of the Constitution which it is designed to carry into execution. The obvious remedy, and that most in accord with the theory of the Government, is to relegate the whole matter of surrenders to the Federal courts in the States where the fugitive is found. Federal officers are, of course, amenable to the general Government. Is this course authorized by the Constitution? There is certainly nothing in the language of the rendition clause itself inconsistent with such a theory. The clause assumes that the "executive authority" of the demanding State shall make the demand, and says that the fugitive shall thereupon "be delivered up." It does not say upon whom the demand shall be made, nor who shall deliver up the fugitive. The turn given to the argument of the court by Chief-Justice Taney in the case of Kentucky *v.* Davidson seems to lead to the conclusion that the clause as it stands contemplated that the demand should be made upon the State executive, and the surrender made by him. In view of the similar provision in the Articles of Confederation, and of what he assumes was the practice under them, the chief-justice concludes that the members of the Constitutional Convention "manifestly intended to sanction the mode of proceeding practised under the Confederation—that is, of demanding the fugitive from the executive authority, and making it his duty to cause him to be delivered up." Chief-Justice Cooley, in his recent article in the *Princeton Review*, also seems to hold that Kentucky *v.* Dennison decided not merely that the duty imposed on governors by the Act of 1793 could not be enforced, but that "within the sphere of Federal jurisdiction no power existed to compel obedience to the constitutional obligation." If these statements be literally accepted, we are confronted with the startling fact that there is no remedy for the present condition of things short of a change in the fundamental law.

But this theory is not that generally held. In the famous case between Pennsylvania and Virginia, before the passage of the Act of 1793, Attorney-General Randolph expressed the opinion that the fugitives might be surrendered without calling upon any State officers. "Private persons may be employed," he said, "and clothed with special authority. The Attorney-General [of Virginia] agrees that a law of the United States might so ordain." That has been the prevailing opinion. In 1867 it was asserted with confidence by Chief-Justice Beasley, of New Jersey, in the valuable judgment in the case of Voorhees (3 Vroom, 141). He said:

"I can entertain no doubt of the power of Congress to vest in any national officer the authority to cause the arrest in any State of a fugitive from justice, . . . and to surrender such fugitive on the requisition of the executive of the latter State. The national right to require the surrender under the terms of the Constitution seems to me clear, and all that is necessary to render such right enforceable in every case is the necessary organ of the Federal Government."

Chancellor Kent (Com. ii. 32, n. h) was of the same opinion. He declared the provision to be a "substantive and essential grant of power by the people of the United States to the Government of the United States"; and he maintained that the subject partook of a judicial character, and was fitly of judicial cognizance by the Federal courts under Art. iii. § 2 of the Constitution, which extends the judicial power of the United States to all cases arising under the Constitution. He thought the Federal courts the "fittest tribunals" to possess the power, and that the marshals might be clothed with the duty of making arrests and surrenders on the warrant of the court. This course he thought autho-

rized by the Constitution, and he believed Congress ought to have adopted it, as the most efficient and safest for the fugitive and most consistent with the orderly and customary administration of justice. It is noteworthy that Kent's opinion, that the proceeding partakes of a judicial character, coincides with what is now known to have been the practice both before and during the Confederation—that is, of making arrests and surrenders without the intervention of the executive, by virtue of a writ from the Supreme Court of the State having jurisdiction, endorsed by the chief-justice of the State where the fugitive was sought. A case occurs in 1784, where an executive declined to interfere, on the ground that the writ of the chief-justice was the proper and appropriate method, and it might cause misunderstanding if the executive interfered with the regular course of judicial action. The existence of this practice tends to weaken the argument of Chief-Justice Taney, based on the language of the Articles of Confederation and on the circumstance that under that compact the States were independent sovereignties, not liable to coercion for violation of its provisions. On the whole, there seems little ground for holding that the rendition clause contemplates or requires that the demand should be directed to the State executive and the surrender made by him. If such is not the case, there remains no legal obstacle to an act transferring the duty of surrender now resting on governors to Federal functionaries, subject to the writ of mandamus of the Supreme Court in case they neglect their duty. Whether such a provision would meet with sufficient favor in Congress to secure its adoption at present is another question. The surrender of fugitives even under the Constitution is popularly looked upon as an act of sovereignty, and it is to be anticipated that the old spectre of State sovereignty would be conjured up by such an attempt to transfer this precious prerogative of executives to the Federal courts. Whether done under the theory that Congress can impose the duty upon any Federal officer, or under that of Kent, that the matter constitutes a case of a judicial character arising under the Constitution, it would doubtless be met with the cry of "Federal encroachment." Chief-Justice Ryan, of Wisconsin, has in a late case arraigned the Federal judiciary for unwarrantably expanding its jurisdiction, in the pure *ante-bellum* manner, and the action in the case of Judge Rives in Virginia indicates an abiding sensitiveness on this point even after the war has enabled the Supreme Court to declare that "The United States is a Nation." In spite, therefore, of the propriety and urgent necessity of action in the present instance, it is not unlikely that Congress would fail to make the change required, and we shall remain for some time yet to come a preposterous spectacle in the eyes of those civilized nations with whom we are year by year entering into more and more intimate and careful treaties for the surrender of fugitives. Meanwhile, our own criminals will run scot free and be the occasion for wrangles between the States as unseemly as they are deplorable.

I. T. Hoague.

Boston, January 28, 1879.

COST OF LIVING IN GERMANY.

To the Editor of The Nation:

Sir: The number of Americans who come to Germany to finish their studies is not only large, but increasing. They study here chiefly medicine, philology, and music. A few hear lectures on law at the universities; but the origin, theory, and practice of German law, as well as the highly abstract and antiquated method of teaching it, are so foreign to our views of jurisprudence that such students generally themselves regard their law studies as a luxury and an accomplishment, rather than a practical gain. Though our students are to be found in nearly every university town, most of them gather at Leipsic and Berlin. Last winter there were more American students at Leipsic than there were natives of all other countries not European together. The figures were: Americans, 67; total, 79. Austria excepted, no single European nation sent so many students to Leipsic as America. The chief states were represented as follows: Austria, 71; Russia, 61; Switzerland, 49; Great Britain, 19; Greece, 14; France, 4; the United States, 67. The majority of our countrymen who study in Germany are not wealthy. Most of them come supplied with a sum which they think with fair economy will last one, two, or three years. Their calculation is based, almost without exception, upon the theory that the expenses of living in Germany are much less than at home. I venture to say that not one in fifty lives within his theoretical estimate. My own experience is derived from a residence in Leipsic and Strassburg of nearly two years, with visits to Berlin, Dresden, and other cities of North Germany. It is not a rare thing to meet men who say that, had they known the expense of studying a year or two here to be so great as it is, they would not have come, or would have postponed their coming. I shall endeavor here, if space be granted me, to state the facts as they now are, hoping they may thus reach a wider circle than that of private intercourse.

As a general statement, it is true that there is scarcely a single article in the range of human commodities that does not cost less in this country than with us; yet the matter of personal expenses is so relative and subjective that the conclusions of different Americans are amusingly various. Wealthy tourists say life is dearer here than in America because they succeed in easily disposing of large sums. Others observe that they can get good instruction for 75 cents per lesson, or a good dinner for 30 cents, and they conclude that living is less expensive here than at home. One can relieve himself of as much money as he likes and receive a fair equivalent, or he may economize to almost any extent. The Germans are, as a whole, poor, and the tendency of life outside the circles of the nobility is toward economy. One of the first characteristics noted by an American is a surprising minuteness of detail in bills, and a regard for sums so small that it seems to him like penuriousness. There is no lavishness, and the new-comer soon begins to fall into the national habit of taking care of the *pfennig* (about two mills). Again, the question is made complex by the fact that prices vary in different provinces and in different cities. Americans, too, must usually pay from ten to twenty per cent. more than natives until they have learned the customs and a smattering of the language. Every American is thought to be rich, and, as a compliment to him, I suppose, it is thought no sin to give him back too little change, to mark up prices when he enters a shop, and to demand high fees.

Allowance cannot here be made for exceptional cases. The following list of prices includes only rates for those accommodations which would not disgust a man of some refinement. I have known Americans to live here with $10 per month, everything included; and thousands of needy German students live with from $10 to $15 per month. But they are unclean, their dress is not respectable, and their food and rooms are becoming neither to a gentleman nor a scholar. Anything less than a German stomach, used to black bread, sausage, fat, and beer, or a German system, used to thick and smoky air and little exercise, would finally give way under the pressure of these prices. The necessaries of life, within reasonable limits, cost about as follows: Board—breakfast of rolls and coffee, 10 to 20 cents; dinner at *table d'hôte*, 20 to 75 cents; private table, 20 to 30 cents. Lodging—one room on first floor, good location, with month's notice, $10 per month; second and third floors, $7 to $9; poor location, first floor, $6; second and third floors, $4 to $6. If one goes to the luxury of study and sleeping rooms together, he must add about 20 per cent. to these rates. A good suit of clothing costs from $20 to $35. A good pair of shoes costs $5. Books not imported are nearly one-half cheaper than with us. They are generally bought in paper and turned over by the purchaser to the binder. Binding costs from 20 to 60 cents per volume in calf, according to the size of the volume. The cost of instruction varies with the eminence of the instructor, and with the methods of it. For private lessons a gymnasium teacher receives 75 cents per hour; but good private teachers of languages may be found who charge only from 30 to 50 cents per hour. The fees for instruction at the universities are very small in all departments save the scientific, where apparatus and chemicals are required, and there they are comparatively slight. Six lectures per week for an entire semester cost from $4 to $6, and the rates dwindle thence down to $2 for two lectures a week. Many lectures are quite gratuitous. Heating in winter costs from $2 to $3 per month extra. This item varies with the weather, as it is the custom to let the fire go out and to rekindle it on very short notice. The fuel is either a sort of soft, peat-like coal, or wood. Our coal-stoves are almost unknown.

The expenses for books are much lessened by the liberal policy of all German libraries, academical and municipal. Upon giving due guaranty, the student may take to his rooms for long periods books from the libraries. Besides, there are many loan-libraries where books may be had for three cents per week. Railway fares in Germany are not high. For second-class fares the rate is about two cents per mile ordinary, and by express train about three cents per mile. First-class fares are nearly one-third more, and third-class fares nearly one-third less, than these rates. In third-class coupés there are no cushions, and connections are bad; but for short journeys in summer they are tolerable. At hotels there is a most complex system of grades, bills of fare, and variations for different meals at different times of the day. The charges at a first-class German hotel aggregate from $3 to $4 per day. This includes wine at dinner, for

no water is drunk. One can live well at a second-class hotel for from $2 to $3 per day; and at a third-class house rates vary from 75 cents to $1 50, and it often happens that a third-rate inn is not so bad as its class would indicate. Laundry bills are one-half cheaper than in the United States.

To generalize, a student may live comfortably, second floor, in a single apartment, in Leipsic for $25 per month, and in Berlin for from $25 to $35. Nothing save board and lodging is included in this estimate. The number of small items, fees, admission charges, etc., usually not reckoned by the student before leaving home, is surprisingly large. For less than this sum he cannot live comfortably, and many would say not decently. Then there are the almost irresistible temptations to visit at least neighboring cities of note. The student should not provide himself with less than $600 a year, though many squeeze through for $400 and $500.

An examination of these figures will show that each of the necessaries of life is cheaper in Germany than in the United States, that board is relatively most expensive, and that books, clothing, and instruction are relatively much cheaper. We see by a comparison of like grades and classes with each other that the cost of living in detail and in the aggregate is less than it is with us. It is about one-fourth less; in some cities one-third less. But an important point here enters into the problem: a first-class German hotel is not so good as a first-class American hotel; a second-class pair of German shoes will not last so long as an American second-class pair; a restaurant of middle grade does not set so good a table as a middle-grade restaurant with us; and this relation runs through the entire list, with the exception of instruction and books. Though Germany is poor, and her body politic is weighed down by a stupendous and costly military system, she pays her thirty odd thousand university professors and her myriad gymnasium teachers well, and ensures them a position for life and a pension in decrepitude; so that her instruction is cheaper and better than ours, and her books are written by the best scholars in the world. While we see, then, that the student may live in Germany in the same rank of life as he lived in at home for from one-fourth to one-third less, and that he may carry economy farther than at home, yet he does not get absolutely as good goods for his money as he has been used to, so far as the material side of life goes. But the result is that most American students do live here less expensively than at home, or they make the same money go farther in the way of travel and sight-seeing, which is the same thing.

As to differences in different cities, Leipsic is on the whole the most favorable city for one economically inclined. In most ancient university towns special advantages are granted to students, as, reduced prices for seats in the theatre and at concerts, discount at bookstores, and the like. Though the seat of the famous *Messen*, or fairs, and though the students number over three thousand, yet rooms are always plentiful in Leipsic. There is every inducement to choose that city, save, perhaps, romantic surroundings—excellent and varied university instruction, good libraries, many interests and phases of German life, a literary and musical centre, a time-honored and well-established theatre, the Gewandhaus concerts in winter, and moderate prices. Rents are dearer in Berlin than in Leipsic, but board is not more expensive. Göttingen and Bonn are more expensive than Leipsic and as expensive as Berlin. Strassburg is dearer than Berlin. It has a magnificent corps of instructors, but it has since 1871 adopted little of the air or customs of a university town. K.

STRASSBURG, Jan. 6, 1879.

Notes.

A SECOND edition of Frothingham's 'Gerrit Smith' has been published by the Messrs. Putnam, the author's difference with Mr. Smith's family being composed by admissions which leave Mr. Smith's veracity unchallenged: he knew Brown was intent on a raid, but did not know (and could honestly deny that he knew) that Harper's Ferry was the chosen rendezvous, or that the plan involved an attack on Federal property—the arsenal—which gave it a seditious character.——Prof. J. C. Welling's "Notes on the Life and Character of Joseph Henry," read before the Philosophical Society of Washington (of which Prof. Henry was President) and printed in the Society's Bulletin, have also been issued separately in a pamphlet of some thirty pages.——We have received the N. Y. *Tribune's* 'Index for 1878,' compiled, under one title, by Mr. John L. Weinheimer: a reference-book of prime utility to journalists, and a mirror of the year's history.——The ninth edition of Fletcher and Kidder's 'Brazil and the Brazilians' (Boston: Little, Brown & Co.) has been revised as far as the plates permitted for the body of the work, and brought down to date also by means of an added chapter and by alterations and substitutions in the appendix. The map, too, shows signs of correction, chiefly in respect to railroad extension. The portrait of Dom Pedro at the age of thirty-five has been replaced with an admirable steel engraving of him at fifty-two, with his prematurely venerable aspect. Ruder portraits of eminent Brazilian statesmen and of the rising composer Gomes, a sketch of whose life is given, still further freshen the edition, in which one could now chiefly wish to see the wood-cuts of persons and scenery yield to more authentic and artistic reproductions of nature, with all the resources of photography and photo-engraving.——The occupation of the new capitol at Albany gives a timely interest to the leading paper in the *Magazine of American History* for January, on the formation of the first constitution of New York, by the editor, Mr. John Austin Stevens. Most curious is the Rev. B. F. De Costa's account of the so-called Globe of Ulpius (1542) now in possession of the New York Historical Society, and which has an important bearing on the Verrazzano controversy. It is announced that the Lenox Globe (1510–12) will form the subject of another critical article. Of the February number, wholly devoted to Washington, we shall have something to say hereafter. Its contents are remarkably attractive.——Those of our readers who may have been interested by our article last week on American Forestry should be reminded of the recent addition of important works on this subject to the Boston Public Library, with the co-operation of our Minister to Italy, Mr. George P. Marsh. In Bulletin No. 46 appeared a list of 148 general and 22 special works, besides a great number of references to agricultural reports, articles in the periodical press, etc.; this has just been reprinted, by request, with additions, in Bulletin No. 48.——No. 10 of the Harvard University Library Bulletin has the usual valuable "supplement," with articles on the early history of the Massachusetts Bay Company; references in Analytic Geometry; the floras of different countries; the life and works of Michel Angelo; the calendar of Lee MSS.; the Sumner Collection; and Shakspere's poems. Prof. Winsor is preparing a list of all editions of Ptolemy's Geography, and a bibliography of the early editions of Milton is also in progress at the Library.——On the 11th of this month, the birthday of Daniel Boone, the newly-founded Kentucky Historical Society will hold its first annual meeting at the State capital. The curator is Mr. Geo. W. Ranck, author of a meritorious 'History of Lexington,' published in 1872. The Society appeals for contributions of all articles appertaining to the history of the State ——The 'Banker's Almanac and Register' for 1879 (New York: I. S. Homans) would seem to be indispensable to the banking fraternity, and of considerable use to merchants and others. That it would have any attractions for the greenbacker, is less apparent.

—Mrs. Francis Lieber, being engaged upon a Life of her husband, the late Dr. Francis Lieber, urgently requests his friends and correspondents (or their families, in case of their decease) who have preserved his letters to send them to her by express. Mrs. Lieber's address is Newport, R. I.

—The Report on the General Index of the Journals of Congress, now in progress by order of the House of Representatives, is a document that concerns not only catalogue-makers and bibliographers, but every citizen. The orderly development of legislation, difficult enough in a Congress whose personnel is so changeable as ours, is rendered doubly so by the impediments to research when it is really desired to ascertain what has been said or done on a given subject in previous Congresses. Hence, on the one hand, the reckless introduction of bills inconsistent with the whole tenor of the statutes; and, on the other, the ignorant acceptance of them, or the vain repetition of debates in which their principles had been long ago condemned. The wastefulness of this habit is not its worst feature; it encourages contempt of precedent, and gives rise to those sudden and frantic efforts to remedy real or imaginary evils for which the present Congress has distinguished itself. No more amusing as well as melancholy instance of the results of the want of continuity in legislation, arising from ignorance, has been seen than the passage of the Silver Bill, as a corrective of fraud and conspiracy, afforded. When shortness of memory begets in the Anglo-Saxon mind suspicions worthy of the Reds of '89 it is high time that an index should come to the rescue, and we regard Mr. Albert Ordway, to whom the task has been committed, as nothing short of a public benefactor. His two communications to the Committee on Rules show him to be fully impressed with the political importance of the undertaking, and to be equal to the practical difficulties of it. He omits private legislation altogether, and for the rest enables the enquirer to "find at a glance the course and final result of legislation

on any subject," each entry containing the number and year of the session and a memorandum of where the matter referred to can be found. Mr. Ordway annexes to his report a specimen taken from the completed index for the House and Senate Journals of the first four sessions of Congress. It seems to us admirably executed, and we can only hope that the extra compensation prayed for as a means of employing more assistants will be freely granted. We conclude by pointing out the advantage which such an index would be to Cabinet ministers admitted to the floor of Congress to attack or defend measures ; and the vast improvement which it ought to effect in the character of Congressional debates.

—Parents whose care for what their children read extends beyond the holidays will welcome two fresh additions to juvenile libraries—the one already standard, the other destined to become so. Of Charles and Mary Lamb's 'Tales from Shakespeare' nothing need be said further than that Macmillan & Co. have brought it out in a cheap but handsome dress, with a vignette by Du Maurier, and an introduction by the Rev. Alfred Angier, who tells how the Tales came to be written, and what was each author's part in them. Their guiding principle, to employ as much of Shakspere's own language as was consistent with their purpose, has been followed by Francis Storr and Hawes Turner, "late scholars of Trinity College, Cambridge," in their 'Canterbury Chimes : or, Chaucer Tales Retold for Children' (London : C. Kegan Paul & Co.; Boston : Roberts Bros.) To use the *ipsissima verba* in Chaucer's case is of course far less practicable than in Shakspere's, and paraphrase and interpretation have been freely resorted to, omissions and transpositions made, and still a fidelity to the substance maintained that is worthy of all praise. The Prologue and the Knight's Tale occupy half the book, the others chosen being the Man of Law's Tale, the Nun's Priest's Tale, the Squire's Tale, the Franklin's Tale, and the poet's own. It cannot be said that everything bloody has been omitted or smoothed over, but all coarseness has, and the stories will interest any child and harm none. What heightens the attractiveness of this pretty volume, besides a portrait of Chaucer, is the character illustrations borrowed in fac-simile from the Ellesmere MS., and which, as the editors justly assert, "give a truer idea of the personages of the Prologue than such modern pictures as Stothart's, or even Blake's." Their archaism is, in fact, charming.

—The February *Atlantic* continues its series of articles descriptive of different phases of American life with a sketch of the Career of a Capitalist which is instructive and, we think, typical of a whole class. The other more solid articles are a discussion of International Copyright, "Limited Sovereignty in the United States," and "Puritanism and Manners," which last is much too full of unconditioned statements. Mr. W. W. Story gives us an extremely entertaining sketch of a journey in the country districts near Rome some twenty years ago ; and the account of "London Streets," by Mr. Richard Grant White, is full of interesting matter. Mr. Stoddard contributes some intimate reminiscences of Bayard Taylor. "The Lady of the Aroostook" is still delightful reading, and Mark Twain's account of "The Great French Duel" is of the cleverest. Altogether the number is of extraordinarily even interest.

—The oldest American poet, Richard Henry Dana, died in Boston on Sunday, Feb. 2, in the ninety-second year of his age. He was seven years the senior of Bryant, having been born in 1787 (Nov. 15), but his muse was less precocious, and his first verses, on "The Dying Raven," were contributed nine years after "Thanatopsis" saw the light in the *North American Review* (with his own editorial approval), to the *New York Review*, just established in 1825 by the poet who left us last year. Moreover, Mr. Dana's poetical activity was confined to a single decade ; after 1833, when he brought out a volume of new poems, he produced, we believe, no more, although he made alterations in those he had written. His complete works, in prose and verse, appeared in 1850 in two volumes, and since that date the younger generation have been reminded of him only by some such accident as the republication in *Harper's Monthly* of his "Husband and Wife" (1858) and his "Buccaneer" (1872). The poet was worthy of this revival, for he had, to use our own words on a former occasion, "the solidly valuable qualities of sense, delicate sensibility, masculine vigor, and cultivated restraint." Although among the first to appreciate the worth of Coleridge and Wordsworth, and more or less affected by them and their contemporaries, he proved his independence of them; and his personal character as visible in his verse had a title to respect which time cannot diminish. Like his father and his grandfather, and his mother's father and grandfather, Mr. Dana was bred to the law, but his poor health and his ample fortune fostered his disinclination to enter heartily upon that career. So essentially literary was his poetic calling that he passed unmoved through the stormy period which inspired Longfellow, Whittier, and Lowell with some of their loftiest and warmest lyrics. A few stories, essays, and a course of lectures on Shakspere are among his prose works published and unpublished.

—We have received from Mr. Alfred T. White, of Brooklyn, whose name is well known in connection with plans for improving the condition of the poor, a copy of some proposed amendments to the Excise laws of this State which are being brought to the notice of the Legislature by Mr. Jonathan Ogden. The amendments are borrowed largely from the Excise laws of Sweden, and seem particularly adapted to our present needs. One liquor-saloon is allowed for every five hundred inhabitants of a city, or for a village containing less than that number. All licenses are sold at auction, so that the local government obtains their actual value, and not merely a license-fee, as is now the case. Besides this advantage, it is evident that a dealer who has paid a fair price for his license will be slow to sacrifice it by a violation of the law, and will be interested in preventing illegal sales by others. Any person obtaining a license is obliged to give public notice of the place where he intends to pursue his trade, and if the owners of half the property situated within two hundred feet of that place remonstrate against the sale of liquor in their vicinity, the dealer will be required to establish himself elsewhere. In this way a good neighborhood is protected, and a liquor-dealer once established finds it to his interest to keep such order that his neighbors will not complain. This system, however, will not apply to any city or town where the inhabitants have established total prohibition. By the adoption of these amendments the liquor trade will cease to be so profitable as to induce large numbers of persons to pursue it ; the revenue derived from it will be greatly increased, and the number of saloons being limited they can be properly overlooked. The trade will also cease to be an element in politics. The simplicity as well as the justice of these changes ought to render them satisfactory to the State, as well as to honest and law-abiding dealers.

—Governor Robinson, in his recent message to the Legislature, touches upon a subject which it is to be hoped will receive the careful attention of that body—the proposal of Lord Dufferin that Niagara Falls shall be set aside by the New York and Canadian governments as a reservation for an international park. The plan contemplates a purchase or appropriation of a good deal of land on both sides of the Falls, a permanent commission, and a revenue from tolls. There can be no great difficulty in carrying this project into execution, and it would certainly be a cheering sign of advancing civilization were it successfully carried out. Every few years the newspapers set afloat the story that some one has proposed or is about to propose the utilization of the water-power of Niagara for industrial purposes ; and the story serves the convenient end of pointing the somewhat stale moral of the devotion of America to the "almighty dollar," the national lack of sentiment, and so on. To our minds the utilization of the waters for this purpose would not be so striking an illustration of those national vices as the use to which the place is already put is a proof of our easy-going national indifference to matters of public interest. The Governor describes the evil as follows : "It is, however, well known, and a matter of universal complaint, that the most favorable points of observation around the Falls are appropriated for purposes of private profit, while the shores swarm with sharpers, hucksters, and pedlars, who perpetually harass all visitors." If the money went to keeping up the appearance of the place, towards making good roads and pretty paths, providing comfortable vehicles to ride about in, and other conveniences of that sort, no one would grudge it. But it does not. It simply goes to enrich private persons, who have little interest in the place except so far as the desire to see it may lead to the increase of their income. We do not mean to reflect at all upon them, or upon the Niagara landlords and hackmen, over whose rapacity the newspapers expend every summer a great deal of indignation. The trouble does not lie in the moral qualities of the hackmen or hotel-keepers, who, according to our experience, are only rapacious after their kind, nor in the moral qualities of the property-owners, who only imitate other property-owners in trying to get as much as they can out of their property ; but in the system. As long as Niagara is regarded as nobody's business, so long will the sight-seeing public continue to be heavily taxed by the intelligent people who are determined that it shall be *their* business.

—But surely the plan is well worthy of the State's interesting itself in

it. From a mere commercial point of view there can be no doubt that the existence of Niagara at the extreme western end of the State has been of great pecuniary advantage to New York, inasmuch as it has led to an annual pilgrimage through it by a class of pilgrims who do a great deal to stimulate the business prosperity of the State through which they pass. Without professing to speak with absolute mathematical accuracy, it may be estimated that a hundred thousand people go every summer through it to Niagara. If they each spend fifty dollars on the way there and back (certainly a low estimate), we have five million dollars spent within the borders of New York every year merely because Niagara happens to be where it is. Of course, leading arithmeticians will differ as to these figures, some insisting that more and some that less people "visit the Falls"; but the main facts of the annual pilgrimage and its commercial importance cannot be disputed.

—The last numbers of the *Revue des Deux Mondes* contain a highly interesting series of articles on the history of the Eastern Question, from its earliest beginnings, centuries ago, entitled "Les Évolutions du Problème Oriental." They are from the well-known pen of Julian Klaczko, and are evidently destined to be formed into a volume, like his former politico-historical contributions to the same periodical, the "Études de Diplomatie Contemporaine—Les Cabinets de l'Europe en 1863-1864," "Les Préliminaires de Sadowa," and "Les Deux Chanceliers." The "Évolutions" abounds in vivid sketches of political combinations, schemings, and theorizings, and in piquant traits and utterances of both East-European and occidental rulers and statesmen. Like all M. Klaczko's productions it is marked by ample evidences of a complete familiarity with the subject, and by graceful and sprightly treatment; but, like all his productions, it also betrays a motive different from an unmixed desire to establish historical truth. Fully susceptible of historical candor, and wonderfully adroit in displaying it before his readers, he yet never ceases to study and sketch history in the interest of Poland. A Lithuanian Jew by birth, a convert to Christianity, and a member of the Polish emigration in France, he is free from prejudices of race, creed, and political theory, but constantly under the sway of anti-Russian, and, in a less degree, of anti-German, sentiment. A friend of the Czartoryskis and of Beust, he was drawn in 1870, when he was a member of the Galician Diet, into an inopportune advocacy of a Franco-Austrian alliance, and soon abandoned the parliamentary arena; and he is now untiring in endeavors to influence French public opinion in favor of a Franco-Austro-English coalition against Russia, or, if necessary, against Russia and Germany. The journalistic power which he wields through his extensive diplomatic knowledge and attractive versatility is such that a well-informed Paris correspondent lately designated him in our columns (No. 673) as "the chief enemy—the arch-enemy, if I may say so—of Russia in France."

—The following fragment of M. Klaczko's sketch of the reaction against Philhellenism, the *pointe* of which is rather striking, is, perhaps, a fair specimen of his broad, discursive, sparkling, affectedly-candid, and superficial way of treating political topics, though it may not fairly exemplify his style, which is generally more concise and less florid:

"Graver, heavier, more conscientious in her science, as well as in her malice, Germany undertook to destroy the Hellenic legend in its most mysterious, most sacred foundations; to despoil the inhabitants of the Peloponnesus and of the Ægean Isles of their last prestige—the glory derived from their past. Fallmerayer devoted a whole life [?] of labors and travels, an unparalleled erudition, a literary talent of the highest order to the demonstration of that original thesis, that the modern Greeks are but spurious Hellenes—in fact, wretched Slavs, possessing no right whatever to the magnificent title of successors to Pericles and Philopœmen. He measured with his callipers the features of every Palikar woman whom mischance threw in his way, and called the world to judge whether those were the proportions of a Venus of Milo. It gave him ineffable pleasure to convince Europe that, like Shakspere's Titania, she had long clasped with her loving arms a head not in the least resembling the Apollo Belvedere or the Jupiter of Atricoli; as if archæology and æsthetics were the criterion of the right of nations; as if all this fine theory, elaborated in hatred of Russian ambition [?], could not be turned with equal, or even greater, ease in favor of the same ambitious tendencies! It was a strange carelessness indeed which made General Ignatieff forget to appeal to the Fallmerayer theory when, at San-Stefano, he strove to force so many Greek lands and populations into the mould of the Great-Bulgaria of his dream."

—'England's Gesetzgebung in Bezug auf die Preise (1326-1601)' is a dissertation published last year by Dr. Ochenkowski, upon his attaining the *venia docendi* at the University of Jena. It is an admirably-told and instructive chapter of the economical legislation of England, based upon abundant extracts from the statutes, which are accompanied by copious explanations and remarks. It is shown that the legislation of this nature was primarily in the interest of the consumer, hardly at all of the producer, while the middleman, and, indeed, the commercial class in general, was the object of constant hostility. Along with the watchful interest in behalf of the consumer, there came in ethical considerations—the desire to check luxury and excessive profit. Whatever protective ideas had a share in this legislation were rather analogous to the English corn-laws than to our American tariff, being prohibitions upon export; but these, too, had the interests of consumers rather than of producers in view. Stringent regulations were at the same time directed against foreign merchants residing in England. In all this there appears to have been no recognition at all of capital as a factor in production, or of production as a broad national interest; and the writer goes on to show, by an interesting analysis of the industrial methods of the time, that the spirit of this legislation was at bottom a conservative reaction against the modern forces of capital, which began to work about the middle of the fourteenth century. The growth of pasturage, which is familiar as a leading fact of the fifteenth century and the early part of the sixteenth, he designates as a retrogression in economy.

HARTMANN'S NEW SYSTEM OF PESSIMISTIC ETHICS.*

IN the war of 1866 against Austria a handsome Prussian lieutenant of artillery, then twenty-four years old, was obliged to pass the night in a damp trench, and from a rheumatic fever which followed partially lost the use of both legs for life. Though his education was mainly military, he had found time for much reading of philosophy and general science, to which he now devoted himself, and a few years later leaped into sudden and world-wide fame by the publication of his 'Philosophy of the Unconscious.' His opinions were novel and often startling; every chapter was full of such curious scientific facts, and his style so simple, direct, and popular, that even cultivated German ladies fell to reading philosophy, and have never ceased to interest themselves in the remarkable personality and the no less remarkable career of the author.

Intelligence, in the system of Schopenhauer, is a final form of development from an unconscious and unreasonable will; while according to Hartmann will is guided from the first by knowledge, and indeed is inseparable from it save in the mind of man. The unconscious is at once Fichte's absolute ego, Schelling's absolute subject, Hegel's absolute idea, the Spinozistic substance, the Eleatic one-all, etc. It is the organizing power in nature, guiding instinct to act according to a purpose without knowledge of the purpose, building up the nervous system and then tenanting it with a soul. It makes no mistakes, never hesitates, is clairvoyant, divine, and finally compels us to infer final from efficient causes. The ultimate end and purpose of the universe, he insisted, was not justice, goodness, happiness, or freedom, but the development of consciousness. Yet the more consciousness the more unhappiness; pleasant impressions fade, those which are unpleasant are indelible. Men have awaited happiness successively in the future of the individual on earth, and in the future of the race in this, and finally in another world, but vainly and without reason. Pleasure is ever misery's decoy-duck. Earth is bankrupt in happiness. Joyous expectations are never realized, etc. In view of all this we must not, as Schopenhauer said, cease to will, but press on in the universal struggle to develop intellect till action become so utterly irrational and antagonistic that it must cease for ever. How all this occurs is left very indefinite, and it is precisely here that the new synthesis we are about to consider begins.

The discussion occasioned by the publication of the 'Philosophy of the Unconscious' was bitter, and has now lasted a decade, while the work has just passed to an eighth edition. Professor Michelet expressed "honest pity" for an author who brings such "miserable nonsense" into the philosophical mart. J. C. Fischer called it a "pyramid of absurdity" fit to "excite universal laughter." Dr. Hausemann feared that the doctrine of the infallibility of the unconscious would tend to the notion of a potential infallibility of the pope. One avers that Hartmann has "shamefully duped the world," another calls his book a "snarl of idiotic stupidity." "Reason run mad," "the odor of death pervading the whole volume," "purely pathological," "frivolity and pretence," "the jugglery of logic," "a plea for moral bankruptcy," and similar verdicts almost by the score have been pronounced by adversaries. On the other hand Professor Lasson considered it one of the best expressions of the tendencies of modern times, admirably calculated to reconcile the classic works of

* 'Phaenomenologie des sittlichen Bewusstseins. Prolegomena zu jeder künftigen Ethiks. Von Eduard v. Hartmann.' 890 pp. Berlin. New York: Westermann. 1879

German philosophy with the methods and results of modern science. Professor Kapp calls it the inauguration of a "new way of regarding the universe." Professor Schweitzer considers it very significant, brilliant, interesting, etc. Other writers too numerous to mention, but to whom Hartmann has called attention in a prospectus, have more guardedly spoken of his system as "*genial*," of a "thoroughly pure and noble moral tone," as a "remarkable bit of cultured history which will survive the next century," as "suggestive to an unparalleled degree," etc. Thus it is, perhaps, not too much to say with Dr. Kirchmann that its reception, not only among scholars but throughout the reading world, was unprecedented in the previous history of philosophy.

Soon after the publication of this work, in 1869, the author was honored by a call to a professorship of philosophy at Leipsic. His health made it impossible for him to accept, and the chair remained vacant till it was assumed last year by Professor Wundt. He has published in the meanwhile several minor treatises: "The Self-Dissolution of Christianity and the Religion of the Future"; "Critical Foundation of Transcendental Realism"; "Strictures and Elucidations of the Systems of Kant"; "Schopenhauer and Hegel"; "The Unconscious from the Stand-point of Physiology and the Development Theory"; "The Truth and Error of Darwinism"; and a volume of "Collected Studies and Essays." The author has lived meanwhile in the greatest retirement in a simple and almost homely style in an uninteresting suburb of Berlin, leading a purely intellectual life, and not in the least indebted for his influence to personal inculcations or to literary cliques. He is essentially a man of genius, a musician, a painter, and the author of one tolerable drama. He is a most indefatigable worker, eschewing most current literature. His manner and personal appearance are striking. He is short and rather thick, walks with great difficulty and only on level ground, and prefers to wheel himself in an invalid chair. His long, abundant sandy hair and beard, and his fine poetic eye, his very rapid utterance and quick movements, his brief characterization and denunciation of the "professorlings" who most severely criticise his opinions, his confidence that he is only in the beginning of his philosophical activity, all combine to make a most strongly-marked and original personality, in which the keen sensitiveness of a poet and an invalid is combined with great force of purpose and power of sustained mental effort. His pessimism is almost a religion with him, and he accepts and defends with ardor in private conversation all its consequences and implications. A high place among synthetic thinkers must be allowed to him, and the appearance of his new work, narrower in scope but much more thorough in method than his first, is an event of at least great literary if not of truly philosophic moment.

The first and lowest form of moral consciousness, says Hartmann, was characterized by the Cyrenians. Their naïve hedonism taught that pleasure was the end of life. The discussion of the different sorts, degrees, and consequences of enjoyment led to the true eudæmonism of the Epicureans, who taught that mental pleasure was preferable to that of the senses, and that friendship and freedom from passion and desire were the supreme forms of happiness. Aristotle, Hobbes, and especially Spinoza represent this system in greater detail. Its practical half-truth is a wise and moderate *savoir vivre*, which is the highest result of what is termed the mundane positive eudæmonistic morality. As soon, however, as men begin to reflect on the disproportion between happiness and merit, the postulate of an all-wise and transcendental Judge is erected, and by degrees develops into a system of rewards and punishments in a future state. To this vulgar form of egoism, best represented according to the author by the Jesus of the synoptic gospels, earthly motives and pleasures soon come to appear low and unworthy when compared with those which are heavenly. This antithesis he regards as both false and impossible. Sensuous elements are inexpugnable from every conception of a future retributive state, and a noble epicureanism is far better. The inevitable self-criticism of this moral scheme leads to the negative phase of cynicism. Pleasure is seen to be impossible, and the individual in this stage withdraws from the world and is indifferent to its opinions. He seeks only to lead a harmless life and avoid evil, and feels that the world can neither give him anything he desires nor take from him anything he loves. This again is a partial, because a merely individual, stand-point, and the "negative transcendent moral" is sure to be inferred. Suicide, or refusal to live by asceticism, or the insight that the end and object of living is not to be happy, but to be independent of happiness, and that only those who know little and whose experience has been shallow find enjoyment in life, result from various degrees of development of this stage of moral consciousness. All morality, at least, is only a palliative between full enjoyment of the world on the one hand and refusal to live on the other. In this extreme of self-negation the ultimate but inevitable bankruptcy of every egoistic moral system is manifest. The first cycle of the moral consciousness ends thus in utter self-renunciation and despair.

The more complete this shipwreck of the selfish principles the more eagerly do men grasp after heteronomous authoritative principles, and the more uncritically do they apply them to the guidance of conduct. According to the well-known views of J. H. Kirchmann, this is the highest morality. Humanity, the state, etc., is infinitely higher and wiser than the individual. To obey because we are commanded is the highest and final moral motive. Precedent in law, good government, business, social intercourse, all depend on this instant and complete surrender of the individual will to higher authority. The moral act brings rest, but never pleasure, etc. True, replies Hartmann, the sentiments of reverence and veneration are independent of the feelings of pleasure and pain; but even these must not be unduly exalted above self-respect and independence in thought and action. The origin of paternal authority is sought in the animal instinct of defending the young. This is the first and fundamental form of all authority. Legislation stands for the control of the worst elements and individuals by the moral consciousness of the best. Custom is an unconscious which should be replaced by a conscious morality. Church authority is the most insidious and dangerous of all for both mental and moral culture. The autonomous movement by Protestantism is of great theoretical, but has proved to be of little practical worth.

With the discussion of such points the introductory, or "pseudo-moral," portion of the work ends. It has shown that conscience is not simple, but a very complex product of all varieties of instincts, feelings, opinions, tastes, etc., and that freedom of conscience postulates merely the negation of every heteronomous element. Everything is thus far strictly in the spirit and method of Hegel's Phenomenology. Hartmann expressly assumes the same objective stand-point, and, though renouncing the dialectic method, has not, save in a few inconspicuous details, succeeded in working his way to independence of his most ingenious model, which is now coming to be considered in Germany not only as the most significant part of the Hegelian system, but as one of the acutest and most suggestive of all the products of philosophical thought.

Is there in consciousness a spontaneous ethical estimate of human actions, apart from all conformity to outer authority or influence? With the discussion of this great question the second part, which is entitled the "True Ethical Consciousness," begins. First among the subjective motives of morality is the æsthetic principle of taste, the existence of which enables us to answer the above question, which is purely empirical, affirmatively, by asserting the existence of such a principle without telling or knowing what it requires. Taste is conscious of no objective or subjective reasons for its choice, and it demands only what is morally beautiful. The doctrine of the golden mean is the apotheosis of mediocrity. The principles of harmony, of perfection, moral ideal, and the many reconstructions of society proposed by reformers, are all shown to be the products of merely æsthetic judgments. A deeper moral principle is found in feeling. Pathos, enthusiasm, pride, humility, regret, resentment, sociality, sympathy, fidelity, love, are each characterized in long sections, and a transition is finally made through the feeling of duty to what are termed the rationalistic moral principles—practicality, truthfulness, freedom, accountability, and purpose. The latter is here the most comprehensive of all moral principles, just as in the Philosophy of the Unconscious it is necessarily conceived as the *inner Moment* of the absolute. We constantly and inductively infer ulterior from nearer immediate ends, and the teleological ordering of our actions teaches us not only their but our own relativity. The "higher egotism" is thus bankrupt, and the ethical consciousness turns at last towards altruistic social ends. Social democracy seeks the greatest enjoyment for the greatest number. This would not be diminished by the decay of culture, which is, in fact, the greatest enemy of general happiness. The illusion of the greatest-happiness principle would eventually lead the world back to animalization. But against this consummation the ethics of evolution not only teaches that the most vigorous and virtuous survive, but it impresses the duty of developing intelligence to the uttermost. True, the culture of a high civilization necessarily produces misery, poverty, and vandalism. It tends to unsphere women and to the precocious cephalization of children, excuses competition and even war, and hence, finally, a higher absolute, monistic, religious moral principle must be sought, which shall

tend to the practical and essential identification of individuals with each other, and then with the absolute itself.

We must know and autonomously will to follow non-egoistic absolute ends as essentially our ends. Cosmic development is the life-process of the absolute, which must be presupposed as identical with my own essence and as teleological. Accepting its unconscious ends as our own, we are able to do morally right so far as we develop the full consciousness that our will is but a branch of the all-will. If the notion of an absolute, or of God, is to have any value as an hypothesis, we must conceive him as unhappy before the beginning of things. The final cause of creation was not, as Hegel believed, a self-mirroring of the absolute. The unfolding of the universe is rather a pathological healing process which goes on within it. The world is a "plaster to draw its inner pain outward." The positive transcendental happiness of God before creation is purely mythic. The divine complacency which pronounced all that was made "very good" expressed no positive joy or satisfaction, but only an amelioration of inner woe. Cultured piety sees that pity, not love, for God is man's highest duty. The emancipation of the absolute from its transcendent unhappiness may never be complete. New generations, races, worlds may ever perpetuate the immanent torture, nearing only by asymptotic approaches an equilibrium between universal pleasure and pain, but we must never forget that the world and the absolute must be redeemed, if at all, together. God can redeem the world only by being redeemed by it. Only the phenomenal selfish individual, who seeks pleasure, fancies that he can find release from the duty of universal co-operation in death, which he is too puny-souled to seek. All the elect understand that the supreme duty of redeeming God from pain, or of "ameliorating the negative eudæmonism of the absolute," is a duty which will end only with the universe itself. The work closes with the sentence: "Real existence is the incarnation of deity; the world process is the passion-history of God made flesh, and at the same time the way to the redemption of Him who was crucified in the flesh. To be moral is to lend a helping hand in shortening this way of suffering and of redemption."

From this all too brief epitome the reader may see that the classification of the various moral theories which occupy the first three-fourths of the ponderous volume is ingenious and suggestive, and exhibits a broader and more philosophical plan of treatment than is found in any modern ethical work; but it is no less evident, on careful reading, that neither the author's scholarship nor his critical or analytic power has sufficed to justify the pretentious title of his work. His systematic method is arbitrary, his transitions, especially from the morality of taste to that of feeling, and again to that of reason, often purely artificial. His spirit is more dogmatic and mystic than in his earlier work, and the book, though expressly addressed to lay readers, is far less simple in style. He has had the hardihood to carry out the pessimistic conception of the universe to its extreme logical consequence. His "system" is complete. It is a most gloomy poem by a sensitive æsthetic soul whom fame does not comfort for personal misfortunes. He has the synthetic power of an artist and not of a philosopher. Attention is irresistibly drawn from his work to his personality. Hence a strictly psychological (none the less interesting if it proves pathological) problem is presented to the critic, viz.: what physiological or other reasons will explain why an aristocratic and vigorous young soldier, suddenly robbed of his career, his associations, his personal comeliness, his fortune, and largely even of the use of his muscles—those most faithful servants of the will—living in retirement with a wife sensitive, cultivated, and invalid like himself, should find satisfaction in believing and teaching that all happiness is born of ignorance, and that Deity is in need of human pity and help? We have no present wish to discuss this problem, but Herr v. Hartmann should at least not forget, when he tells the complacent world that it is miserable in spite of fancied happiness, that it will be apt, before accepting his pessimistic gospel, to ask most searchingly if the unhappiness he fancies is or should be universal is not really his own.

RECENT NOVELS.*

SOMEWHERE in the early part of this century was published a book, half humorous, half descriptive, called 'The District School as It Was.' It was in striking contrast to 'Roderick Hume; the Story of a New York Teacher.' The scene was laid in New England, which gave a local quality to be allowed for; but, all allowance made, there is a mighty change in the fifty years between the two stories. Then literature was cultivated, if not "on a little oatmeal," yet under the sternest conditions. Short sessions, scant salaries, severe discipline necessary to induce the refractory flock to begin the ascent to Parnassus, were the rule, and the teacher's place was supposed to be held by stress of necessity. The times change, however, and we change with them, and trust-funds, endowments, and shrewd speculation play a prominent part in the more recent story. To furnish a marketable article is the object of the school management, and the reputation and capacities of the teacher are points to be scored in the game. The under-teachers are a powerful and well-connected body, and school events are also village events. The book is vivacious, and the author knows the ground he describes; but it is difficult to imagine any one less fitted for his place than Roderick Hume. Self-confident, rash, inexperienced, knowing neither human nature nor himself, prejudiced and hasty of speech, he is very nearly a model, except in honesty of intention, of what a teacher should *not* be—though possibly in the incidents of his visit to New York the author is showing his own knowledge of the world at the expense of his hero. Mr. Bardeen exposes some of the tricks whereby public funds are unworthily obtained, and the way in which good State regulations can be evaded or turned to harm in a fashion well known on a wider stage, and, carrying his hero through hope, disappointment, folly, and despair, brings him out with flying colors at the close of the book.

The republication of inferior early stories by an author who has written a successful book, seems the inevitable result of debate between need of money and desire to maintain literary reputation. The first always triumphs. All the failures, the rough copies, the blotted outlines are bestowed on the public, and we are taught afresh how difficult it is to do well, how easy to blunder. 'Kathleen,' 'Lindsay's Luck,' 'Pretty Polly Pemberton' are all set afloat afresh in the wake of Mrs. Burnett's later books. The first, 'Kathleen,' is an unnatural American story; 'Lindsay's Luck' an unnatural English story with an American hero; and 'Pretty Polly Pemberton' a lively, vulgar little "tale," entirely appropriate to the columns of a second or third-rate English magazine.

A book written by Jules Sandeau and crowned by the Academy bespeaks respectful reading, and, even when it has been read, one casts up the account of defects and good points with a great pull in favor of anything so originated and so rated. Our readers will judge for themselves. The first fifty pages give a charming description of a certain Chevalier and Marquise, old friends, who had faced the emigration of the nobility together (with the Marquis), and who by their French wits and philosophy had made life in exile possible, then endurable, then cheerful. The Revolution is over, their estates have chiefly been restored to them, the Marquis has gone over to the majority, and the two well-bred old people cheer each other's lives with neighborly visits; talk of old times, and speculate together on the future of the Chevalier's only child, Maurice de Valtravers. To them enters a girl of fourteen years old, the niece of the Chevalier, thrown on his protection by her mother's death. Presently Maurice departs for Paris, where he treads the paths prepared for rich, idle, excitable young men, and where he lingers year after year, writing home more and more rarely, but drawing on his father as long as the Chevalier's fortune lasts. Meantime Madeleine is the stay and comfort of her uncle's life, and watches his death-bed, where his son is not to be seen. The Valtravers estate is to be sold, the Marquise purchases it, and, dying soon after, bequeaths it to Madeleine. She has there a hasty visit from Maurice, who returns to Paris at once, having made an appointment with himself to kill himself. We hear of a lawsuit, brought against Madeleine by the disappointed heirs of the Marquise; and, shortly after, we are as much astounded as Maurice, when Madeleine, accompanied by a peasant girl called Ursula, presents herself in Paris at the apartment of Maurice, tells him that she has lost everything, and has come to him as her natural protector. Maurice, who has taken his last walk, kissed his pistols and prepared for a short shrift, is astonished, indignant, recalcitrant, *cross;* but Madeleine is firm, and after walking him about Paris (accompanied by the preposterous Ursula) and across the track of his former friends, fixes their home in the rue de Babylone, obtains from her cousin a promise to live two years in order to give her a good start, and proceeds to work for the living of both parties. Maurice was certainly not an amiable inmate. "He asked himself by what cowardly condescension, what incredible weakness, he had permitted himself to be brought to this. He accused himself of imbecility, and

'Lindsay's Luck. Pretty Polly Pemberton. Kathleen. By Frances Hodgson Burnett.' New York: Charles Scribner's Sons.

'Madeleine: A Story of French Love. (Crowned by the French Academy.) Translated from the French of Jules Sandeau by Francis Charlot.' Chicago: Jansen, McClurg & Co. 1879.

cursed the name of his cousin." A long illness follows ; and when he recovers it is still to a state of ill-tempered idleness. Madeleine suggests wood-carving, in which he has been proficient. He does not precisely fling the tools in her face, but contrives a verbal equivalent. Finally, to assist a fellow-lodger, a distracted cabinet-maker, Maurice does carve a figure, and gradually goes to work. Being a little better in health and freer in his movements, it occurs to him that he ought to seduce Madeleine, and he begins appropriately. Madeleine puts a stop to that and invites him to dine. As the months go on he sometimes reads to Madeleine in the evenings, and selects a disgraceful book which she allows him to read to the end. Then they begin to go to the opera together ; Madeleine sings to him ; they take country walks together ; and when the two years are well over, Maurice finds himself in love with his cousin. A Sir Edward (we cannot find that he has any other name) appears on the scene as patron of Maurice and lover of Madeleine. Maurice feels it his duty to leave the ground clear for him, and goes off on a walking journey, which brings him to his native village and the entrance to his father's avenue. He goes up the path, finds Madeleine, Ursula, Sir Edward, the cabinet-maker and his wife on the *perron*, the château in perfect order, and the old servants bustling about. It has all been a made-up story. Madeleine did not lose her lawsuit—has been a rich woman all the while, but thought best to play this little comedy for the restoration of the prodigal. She gives Maurice a final talking-to, and then they are married and live happily ever after. The delicacies of description and the cynical sayings scattered through the book are such as one looks for from M. Sandeau ; but the plot appears to us worthy of Madame de Genlis, and it is possibly this peculiar element of moral trickery which justifies the second title of the book—'A Story of *French* Love.'

Cherbuliez is fortunate in being the master of a style which is so clear and pure, and at the same time is so little tinged with an individual manner, that it is thoroughly translatable. The translation of the 'Comte Kostia' or of the 'Revanche de Joseph Noirel,' though it cannot be said to be as good as the original, conveys to the reader a very adequate idea of the author's literary character. The same thing may be said of 'Jean Têterol,' his latest production. This is, to our mind, the least effective of his stories, and compared with 'Joseph Noirel,' or 'Samuel Brohl et Cie ,' is hardly worthy of him ; yet it is clever enough to make the fortune of an ordinary novelist. Jean Têterol is a man of the people, who in early life has been a workman on the estates of a certain Marquis, a gentleman of the old school, who has no idea of the fierce democratic passions and wild hopes that are raging in the mind of such sturdy dependents as Têterol. For an affront which the Marquis hardly thinks a man in his position capable of resenting, or feeling as an insult, he leaves his master's estates and goes off, resolved on revenge. By steady industry and devotion to his fortunes he accumulates a large amount of money, which he lays by with the fixed idea of returning to the home of his early life, and acquiring possession of the estates of the Marquis. At last he returns, burning with revenge, to carry out his plot, only to find, however, that his dream has been foiled in a way that had not occurred to him as among the possibilities of the case—by his old enemy's death. The marquis, however, has left a son in possession of the estates, and this son is a man of easy-going, self-indulgent disposition, who has led a gay life, and finds rather late in it that he must turn over a new leaf, economize, manage his estates, and in fact change himself from a gay citizen of the world into a sober country gentleman. Jean Têterol determines, as he cannot be revenged upon the father, to make the son pay for the father's insult, and accordingly begins an elaborate campaign, the end in view being the acquisition of the estate and the ruin of the Marquis. Têterol, however, has a son who is as different from his father as possible, while the Marquis has a daughter as different from her father as can be. These two, without knowing how curiously their fates are related, fall in love with each other, and finally, after many crosses, the whole ends in a happy marriage ; and Jean Têterol's idea is brought to naught, as ideas of the kind should be. Such is the baldest outline of a story which though, as we have said, not on a level with other novels of Cherbuliez, is well worth reading. The character of Jean Têterol, obstinate, revengeful, and selfish, but loving his son better after all than himself ; of the Marquis, polite, self-indulgent, finding everything but pleasure a bore, while reconciling his conscience to his life by a number of well-rounded phrases and maxims of a highly moral character, which do duty in the place of any moral actions ; his daughter, charming as all the young girls in Cherbuliez's novels are, and the son of Jean Têterol, filled with the chivalrous ideas which make his father's blood run cold, while they inspire him at the same time with a sort of dazed admiration—all these characters are well drawn, and if the plot were only more interesting, would leave nothing to desire. But the plot comes to nothing. Jean Têterol's idea is not carried out, and what does come to pass is what the reader has seen was coming from the first. Cherbuliez is not a writer who lets you divine very much from his books as to his opinions, though he differs from many French novelists in the fact that the reader is quite confident that he has opinions. Unless we are mistaken, one of these is an opinion very hostile to aristocrats and aristocratic institutions. His aristocrats are almost always bad, while the pictures of a happy and good existence in his books are generally to be found in the lives of untitled and unpedigreed people ; witness the Comte Kostia, the Comte d'Ornis, the patroness of Samuel Brohl, in this book the Marquis, and on the other side the delightful description of the bourgeois household in 'Joseph Noirel.' At the other end of the social scale, to be sure, he has bad characters enough, such as Samuel Brohl himself, and Joseph Noirel, who certainly cannot be considered a model. But you feel that these are to a great extent the unfortunate victims of circumstances ; while the Comte d'Ornis murders his friend because aristocrats have cruel and vindictive passions, and the Marquis in Jean Têterol is selfish and pleasure-seeking and hypocritical because these are the vices of marquises. What Cherbuliez's politics are we do not know ; but his books, as might be expected from a true Genevese, are republican ; in this respect nothing could be more different than his novels and those of a writer like Octave Feuillet, who, though he resembles Cherbuliez in a certain purity and delicacy of style, is essentially a novelist of aristocratic life.

Henri de Chelles, of an ancient and noble French family, ran through his money early in life, and, after giving his friends a great deal of trouble, finally agreed to expatriate himself in consideration of his debts being paid by his sister's husband, M. de Clairac. In America he meets with the beautiful Doña Manuela de Moralés, of a rich and noble Mexican family, whom he marries. Unfortunately, she is disinherited at the same time, and Henri is worse off in this world's goods then ever. He joins the Union army and is killed in the battle of Bull Run. His wife dies two years later, leaving to the care of the French branch of the family her child, Manuela. 'Remorse' opens with the introduction of the orphan to her aunt, Madame de Clairac, in Paris. This lady is a woman of the world, with two married daughters, a *salon*, and a position to keep up. Manuela is a child of nature, beautiful, innocent, and confiding. One of the persons on an intimate footing at her aunt's house is Maurice Morton, the distinguished poet and romancer, at bottom a cold and selfish man, but one who analyzes his emotions and sensations to a good purpose. Manuela has read some of his books, and he, consequently, makes an immediate impression upon her. He is interested in her, but not sufficiently to be blind to the fact that she would be no match for him. He encourages her interest, in the heartless manner peculiar to men of his stamp, until it needs but a word from him to make her happy for life, and this word he seems perpetually on the point of uttering. Just at this critical time her aunt finds a husband for her in the person of M. Walrey, a man of the people, the head of a great firm of metal-workers, thoroughly good, but, it must be confessed, not so agreeable in conversation as Maurice Morton. She, to bring matters to a test, asks Morton's advice, and he breaks her heart by advising her to marry M. Walrey. She takes his advice, however, marries, is carried home by her husband to his place in the country, where she lives in the midst of blast-furnaces, rolling-mills, forges, manufactories, and so on, taking no interest, however, in her new life, and dreaming frequently of Morton and a very different home. Here appears a new character, Pierre Liéven, *alias* "Rolling Stone," or "The American," a good-for-nothing workman of M. Walrey's, who has socialistic proclivities, and is, not unnaturally for one of his turn of thought, in love with his master's wife. The current of events takes Mme. Walrey back to Paris, where she again sees Maurice Morton, whose passion becomes, now that she is fairly married to another man, much more ardent than before. She still loves him, and, afraid of her own weakness, insists on his leaving her. Unfortunately, at the moment of leave-taking they are surprised by M. Walrey, who carries off his wife. After this comes the murder of M. Walrey by Pierre Liéven, and the remorse of the widow ; remorse for what, it is rather difficult for the author to explain, for she had never done anything wicked. However, the book being called 'Remorse,'

'L'Idée de Jean Têterol. Par Victor Cherbuliez.' New York : F. W. Christern. The same Englished ('Jean Têterol's Idea'). New York : D. Appleton & Co. 1878.

'Remorse : A Novel. From the French of Th. Bentzon.' New York : D. Appleton & Co. 1878.

there must be something in it to justify the title. She therefore devotes herself to perpetual widowhood, while Morton writes a "pessimist romance," in the style of "Nathaniel Hawthorne, that keen analyzer of subtle and mysterious causes." This psychological study, the author observes, was "the very evident result of the keenest observation of mental agony in all its phases." People said of it, "How deeply he feels!" "He has written with his tears, with the blood from his veins." And so it was; Morton "had pitilessly utilized his own impressions and those of others. It was his right as an artist." 'Remorse' cannot, on the whole, be called a very strong book, though the opening chapters contain some nice descriptions of character. The author attempts more than she can carry out, and, after introducing Pierre Liéven and murdering M. Walrey, she rather staggers under her accumulated burdens.

In 'A Paper City' Mr. Locke has undertaken to draw a picture of the rise and downfall of those Western "cities" which are built up (on paper) by the manipulations of a set of clever speculators and swindlers, aided by the sanguine credulity natural to the inhabitants of a new country rapidly filling up by emigration. The story reads like a true one, and if New Canton is not the name of the town whose history is given, it may be taken as the type of such towns. It was "developed" by means of a land company, a savings-bank, and a subsidized press, and when it had reached the height of its prosperity, it was suddenly reduced to its original condition by the flight of the trusted financial genius of the place with all the available assets of the bank and land company. Of course the authors (it appears from the preface that Mr. Locke has been assisted in his work by "Shirley Dare") have thrown in a love story, in fact two or three love stories, but the main interest of the whole centres in the adventures of New Canton itself. In the financiering of Mr. Burt one cannot help being reminded of the financial expedients resorted to by the leading citizens of "Confedrit Cross Roads," where Mr. Nasby is postmaster, and some of the extracts from the local newspapers, showing the probable future of New Canton, are very amusing. Humor is much more in Mr. Locke's line than love; of this he makes strange stuff, that still has an unpleasantly real Western flavor. The heroine is engaged to be married to the hero, but is forced by her parents into a union with a man she detests. Her husband, who proves to be a drunken villain, maltreats and beats her. He is himself finally beaten within an inch of his life by the hero, and shortly afterwards commits a robbery and disappears. His flight is immediately followed by a suit for divorce, in which the attorney who appears for the plaintiff is no other than the hero, and the author adds: "It is unnecessary to occupy paper in saying that, within an hour after the decree was obtained, Mary Lewis and James Gardiner were united in the bonds of holy matrimony."

We do not know who "Blanche Westcott" is, but from internal evidence we infer that this is her first novel, and we sincerely trust that she will not attempt another. We do not say this because of any immorality in 'Jean,' because it is essentially a pure and blameless work—the worst thing that the heroine does in it is to break the rules of a school relating to bounds on one occasion, and of this she repents. Jean Hogarth is the daughter of a physician, left at his death without means of support, and is taken home and made a wretched drudge by a close-fisted uncle and cousin. She finally escapes, and marries happily in the end. This is all well enough. No one can find fault with this plot in itself, though it is not new; but the jaded novel-reader requires something more, something in the way of description, or character, or original style. As to the last, it must be said that the author uses occasionally original English, permitting herself such phrases as "to suspicion," "an ambidexter" (applied to a young woman's management of hairpins), and "bump of inhabitiveness." But in description she is weak, as may be inferred from this account of "W. C. M. Moultrie," a gentleman who "writes for the Eastern periodicals": "I took the greatest pleasure in comparing him with all the other men I knew, and what a Saul he was above them all, with his noble head, his musical voice, the perfect culture of his manner, the intelligent beauty of his face, and oh, gracious! what was the use of thinking of him in parallel with anybody else?" The description of the squalid and miserable life in her uncle's family is the best thing in the book. We should fear the tendency of 'Jean' to diminish the general public respect for girls, who as a class it is important should not be made contemptible or ridiculous. Indeed, we are firmly of the opinion that all descriptions of girls in novels ought to be by men, if we would not have many of the most beautiful illusions of life destroyed.

Mary Wollstonecraft. Letters to Imlay, with prefatory memoir by C. Kegan Paul. (London: C. Kegan Paul & Co.; Boston: Roberts Bros. 1879.)—The romantic career of Mary Wollstonecraft found its place as an episode in Mr. Paul's previous 'Life and Letters of Godwin,' to which this volume is in some sort an appendix, but no impartial narrative or adequate defence of her life has yet been written. Bred in a vulgar home, under the care of a dissolute father, and in her earlier years brought into intimate associations with two like families, she had gained her experiences of married life in the worst school; of an independent spirit and extremely sensitive temperament, she revolted against the social conventions that resulted in such homes, and so it happened that when, after supporting herself by teaching for some years, she began her literary life, she published a work which by the vigor and plainness of its speech upon marriage and other social relations brought upon herself violent condemnation not unmixed with whispers of scandal in her private life. She was called an atheist and a libertine, and probably most of those who know her only by name in our day associate with her some ill-defined moral obliquity. Mr. Paul has attempted to clear her reputation by showing the humanity of her motives and the purity of her affections, and has reprinted her letters to Imlay as a faithful and the best illustration of her character. They are letters of a purely private and domestic nature, and should never have seen the light; but, although we see no reason why they should be recalled to public notice now, it would be unfair, perhaps, to find fault with Mr. Paul's republication, since her own husband, Godwin, first issued them. The story they tell is a sad one; they disclose private sorrow so intense and piercing, tragedy so nakedly real, that one reads them only with pain and cannot escape a feeling of intrusion. It is not necessary here to go into any detail. At the time of the Revolution Mary Wollstonecraft went to Paris, where she formed acquaintances in the party of the Gironde; there she met an American, Captain Gilbert Imlay, who had served in our Revolution, and had become a commissioner for laying out land in the back settlements, of which he wrote a topographical account afterwards published in Dublin. He was in France for the sake of money-getting, and his devotion to that pursuit is a frequent subject for reproach in these letters. After a brief acquaintance she became his wife, Mr. Paul says, resting his assertion upon a business document of Imlay's in which she is so called. No marriage ceremony was performed, nor is there any reason to suppose that any was desired, although many honorable motives have been assigned for the omission. Mr. Paul cites the most important obstacle to legal marriage in the fact that she was an Englishwoman, and quotes very appositely the situation in 'Corinne,' where Lord Nelvil, speaking of Madame d'Arbigny, says: "Je l'aurais épousée, comme elle le voulait, s'il ne se fût pas recontré dans ce moment les plus grands obstacles à ce qu'un Anglais pût se marier en France, en déclarant, comme il le fallait, son nom à l'officier civil." Whatever the reasons may have been, no legal tie was formed, and after a succession of separations, after she had borne the daughter whose fate is so familiar, and after, in a last effort to retain him, she had gone upon an arduous journey to Norway and Sweden to look after some of his business affairs, she found him faithless and unworthy, and in despair attempted to commit suicide by plunging into the Thames, whence she was rescued insensible by passing boatmen—an incident so similar to one in 'Daniel Deronda' that Mr. Paul thinks the novelist drew from history.

This is the story which these letters light up and darken with their outpouring of sentiment, affection, reproach, hope deferred, longing, and grief, until finally the disenchantment came. Yet she does not seem to have been deceived in Imlay's nature from the start; more than one passage might be quoted full of keen sarcasm and biting jest which show that she knew he was the creature of his senses. She certainly loved him with a pure affection, and appears to have hoped for his reformation—to have believed that her own noble nature and the force of natural affection for their child would bind him finally to a quiet and humble home. Towards the last she writes: "I still thought that I and virtue would at last prevail." She was mistaken in her hope; the result was inevitable from the beginning. Throughout all, however, she developed much rarer qualities than love and fidelity; one is surprised at the energy of her mind, the dignity of her demeanor, her courage, resolution, and self-reliance. She concludes her last letter to Imlay thus: "I part with you in peace." Less than two years after she died in giving birth to her daughter Mary, whom Shelley wooed and won over her mother's grave in old St. Pancras churchyard.

Sanitary Examinations of Water, Air, and Food. By C. B. Fox, M.D. (Philadelphia: Lindsay & Blakiston. 1878.)—Although the scientific chemist or sanitarian would fail to find in this book a full treatment of the interesting and important subjects suggested by the title, yet enough may be got to repay amply a careful reading of the book. In the chapter on water, for instance, the method of examination used most commonly in the German laboratories is not even mentioned, and the omission is an important one ; for without that, and especially by ignoring also the German principle of interpreting results of chemical examinations, the reader might be led to suppose that water-analysis is already more a branch of exact science than it really is, whereas the indications given by it, in the vast majority of cases, are yet very unsatisfactory, and the whole subject may still be said to have its future. Pettenkofer's process for estimating the carbonic acid in the air, although preferred to all others in most parts of the Continent of Europe, in the United States, and even by some of the first observers in England, is so imperfectly given that one must search elsewhere for such a description as would enable him to use it. Throughout the work, and particularly in those parts devoted to the consideration of air and food, the general reader may learn much that would be of interest and permanent value. The health-officer, newly appointed and without special experience in sanitary investigations, can scarcely afford to be without the book ; although he can hardly fail to observe that a single standard of estimating impurities, one system of weights and measures, a uniform chemical nomenclature, now and then a clearer and more compact arrangement of the subject-matter, and not seldom a less loose description of analytical methods, would add greatly to its value and be more consistent with the general character of a book intended for scientific readers.

Fine Arts.

THE AMERICAN WATER-COLOR SOCIETY'S EXHIBITION.

THE twelfth year of the existence of our American Water-Color Society opened, with every evidence of vitality, with the exhibition begun last Monday. There are 595 numbers, including oftentimes several sheets to a number, as in the black-and-white exhibit, which is of singular beauty this year. The particular accent of the present exhibition is conferred by a class of workers who have been experimenting with simple clouds of color floated on wet paper. By soaking the heaviest Whatman paper with clean water, and applying transparent color to the drenched surface—soaking up portions for high-lights with an almost dry brush—graded tints may be obtained of all the delicacy of an ether. The difficulty is in the behavior of the blots, which will not confine themselves to an outline, but go stealing about in unexpected places, and dry up unmanageably while the artist is attending to something else. If the effects obtained by this luscious method were reconcilable with academic draughtsmanship, one could see a future for water-color art which might destroy the prestige of every vehicle of painting besides. The limpid splendor of stained glass, the most solid and satisfying impasto of oil, the diaphanous shadowiness of bitumen, besides the damask gloss of printer's ink and the crushed-velvet look of charcoal, are all compassable in sheets treated by this medium, which suggests unimagined riches for the craft of aquarelle. Up to the present, however, the colors sprawl as they like in the hands of the practitioners, and the latter are obliged to come before the public with some very loose thinking. Every method put in practice by our present exhibitors has been displayed before, but with the corrective of a little sanity. Fortuny and Villegas have applied the wet-paper trick to backgrounds, draperies, and even the modelling of flesh, and Galofre with great skill to clouds and foliage ; but each of these experts has conciliated the public in making the expressive part of the picture intelligible by means of accurate drawing. It seems that it is necessary that the mania of "Fortunism" should get over to Munich, and there, with infinite refraction and befogging from German brain to brain, work out its emancipated pathway to the transcendental, in order to effect its present deliverance in the pure Unconditioned.

Mr. Currier, who gave us a striking portrait in the Franz Hals style last winter in the Art Association, is the arch-priest of this harmony of the future. Mr. Brennan abets him, with less out-door escape and a more stifling environment of Fortuny bric-à-brac. Mr. Blum, Mr. Muhrmann, and, in a less jerky style, Mr. Chase, swell the ranks of painting unencumbered with drawing ; the result is a strong distinctive character to the present exhibition, most confusing to the public, and somewhat dangerous to old academic reputations. There are few of the members of the Society proper whose works do not suffer and fall into flatness beside the innovators, even though the latter do not succeed in putting themselves in the right. Mr. Muhrmann, however, is a member, and his incendiary views are the affair of the body which includes him. We find ourselves, on a hasty view, quite unable to be scandalized by the pictures in this method to the degree we perhaps should be. Mr. Currier, with his "Pines" and "Rock Scene" and "Willows and Water" and "Beech-wood Interior" and "Sunset" and "Trees," seems to us not to succeed but to point to a success. The painter, once allowed to dictate the spectator's point of view and mood of mind, must be allowed to have indicated some poetic effects too precious to be thrown away ; he can suggest with his methods the ghostly gray of beech-trunks in a sylvan twilight, or the sweeping shiver of water-willows blotting together their thick plumage. What we do complain of is that the artist does not seem always faithful to his own inspiration ; we are ready to allow in a fly-away sunset effect, like his 390, that cloud-drawing, even the most summary, should be subordinated to the dazzle of splendor sought for ; but what is his excuse for dragging Prussian blue, totally unwarmed, over his upper right corner, and pure pipe-clay white into his lower left ? These are the false notes which Turner allows himself in his skies, distressing the faithful ; and they are never suggested by nature, even to our moods of inattention and self-preoccupation.

Other artists, with no desire to posture as maniacs, seem to have wrung all the sweetness out of the soaked-paper method. Mr. Colman's "Dutch Boats on the Maas" (302) seems to us the most lucid and lovely of all the water-colors he has painted, and it shows a comprehension of every manipulation of floated tint. Mr. Chase's sketch (181) of figures near a balustrade has all the quick glance and pearl-shimmer of the Fortuny sketch (252), and it is more comprehensible. Mr. Homer has a number of *bergeries* this year ; he applies his frank, direct way of transcribing the immediate impression of nature to a set of themes that used to be generally embroidered on satin—Bo-peep and her sheep, Perrette and her *cruche ;* with him "impression" painting takes a fine air of concision and austerity ; the detail he brushes away seems as if it would be an impertinence. The finest figure-picture exhibited is, beyond doubt, Mr. Eakins's "Quiet Moment"; it has the academic accuracy and the impressionist's bath of light and aerial mystery. Mr. Fredericks shows a scene in "Rouen" that every one takes for a Prout, and which is fully as good as any Prout. Mr. Quartley, who is the man of the year, having made one of those decided and inexplicable leaps into public favor that are not always the result of bad work, exhibits a few sketches in harmony with his usual luminous, positive, and satisfying style. Mr. Sartain is simple and strong in a lonely and creepy-looking "Rue des Assassins, Algiers," (14) and an African coffee-house (112). Mr. Beckwith, a new exhibitor, shows some decorative heads of unusual elegance. Mr. La Farge ranges from an exquisitely-caressed "Japanese Inro" (111) to a large and noble church cartoon ; but this artist cannot be dismissed with an epithet, and we shall return to him.

The black-and-white exhibition is a study in itself. One interesting sheet is a large *académie*, or nature-study, in the manner of Holbein, which the Art League of this city sent over to Munich to buy. The artist is one G. Takobides, and the *tour de force* terrific. In wood engraving we find work superior to any European work we know, when the representation is of rich broken effects of light, without suavity of form ; when it is a question of graduated tints on flesh, the manipulation, as in the engraving of Leonardo's *Gioconda*, must be admitted to yield to that of Pannemaker *fils*. Messrs. Harpers' exhibit (with engravers' names not catalogued) includes the fine "Birds and Plumage," after Mr. Gibson. That of Messrs. Scribner comprises the best copying of a charcoal drawing in minute scale on wood we ever saw or heard of ; it is Mr. King's "Home of John Howard Payne," after Mr. Hopkinson Smith. Mr. Marsh has produced this year, we think, his masterpiece in engraving, a Haviland biberon-shaped bit of faience, with its painting of a cock by Couturier, and its contents of loosely-arranged plants. Etchings are contributed by Henry Farrer, Swain Gifford, J. D. Smillie, and others.

FANNY KEMBLE'S

Records of a Girlhood.

8vo, with Portrait, $2 50.

"We had marked for comment scores of passages which are noteworthy for one reason or another, but we must content ourselves with commending the book to our readers. Some, doubtless will say it is too long. For our own part, we should have been sorry to have missed anything."—*Spectator, London.*

"In truth, the book is charming; it grows much upon the reader, and, being crammed full of amusing stories, it may be taken up at any time. It is altogether a book to be read and kept."—*Vanity Fair, London.*

HENRY HOLT & CO., NEW YORK.

Heliotype.

Permanent Photographic Book Illustrations.

THE HELIOTYPE PRINTING COMPANY are producers of Book Illustrations by the Heliotype, Photo-lithographic, and Photo-engraving processes. Employed by the United States Government in illustrating Scientific and Medical Reports, by Scientific, Historical, and other learned Societies, by the leading publishers, and for illustrating Town and Family Histories, etc., etc.

Facsimiles of Medals and Coins, Ancient MSS., Paintings, Drawings and Sketches, Views and Portraits from Nature, Medical and Scientific objects, Antiquities, etc., etc.

DEALER IN INVESTMENT SECURITIES AND COMMERCIAL PAPER.

CUNARD LINE.

ESTABLISHED 1840.

FOR QUEENSTOWN AND LIVERPOOL.

Sailing from New York every Wednesday. From Boston once a week.

RATES OF PASSAGE:

CABIN—$80, $100, and $130, gold, according to accommodation. Return tickets on favorable terms.

STEERAGE—$28 currency. For freight or passage apply to

C. G. FRANCKLYN,

Bowling Green, New York.

NORTH GERMAN LLOYD STEAMSHIP COMPANY

FOR SOUTHAMPTON AND BREMEN.

The Steamers of this Company will sail every Saturday from Bremen Pier, foot of Third Street, Hoboken.

RATES OF PASSAGE TO LONDON, HAVRE, AND BREMEN.

First Cabin, $100; Second Cabin, $60 gold. Steerage, $30 currency. For Freight or passage apply to

OELRICHS & CO., AGENTS,
2 Bowling Green.

CHOCOLAT DEVINCK,

175 RUE ST. HONORE, PARIS.

"HORS CONCOURS."

Sweet, Vanilla, and Fancy Chocolates of all kinds, and Pure Cocoas. Used in the principal Hotels of New York, and for sale by leading Grocers and Confectioners.

WHOLESALE DEPOT, 62 PINE STREET.

E. L. LENTILHON. J. J. CAUCHOIS, Sole Agent.

Pratt's Astral Oil.

PERFECTLY SAFE.

Especially adapted for use in the St. Germain Student Lamp.

CHAS. PRATT & CO.,

Box 3050. NEW YORK

Fragrant Vanity Fair.

A NEW CIGARETTE,

Gotten up in honor of the Paris Award. Each Cigarette bears cut of the Paris Medal and brand, Parisian style. Our Tobacco and Cigarettes are better than ever, and unsurpassed for Purity, Delicacy, and Excellence. Special size Cigarettes, with any NAME, MONOGRAM, CREST, or DESIGN, to order, at $5 for 500. Samples on receipt of postage stamp. Samples of our Asthmatic and Catarrh Cigarettes, each, 25 cents by mail.

WM. S. KIMBALL & CO., Rochester, N. Y.
Peerless Tobacco Works.

The Nation.

NEW YORK, THURSDAY, FEBRUARY 13, 1879.

The Week.

DR. NORVIN GREEN, the President of the Western Union Telegraph Company, has written a letter to Mr. Clarkson N. Potter intended to defend the Company from the imputation of breach of confidence or partiality involved in the allegation that the political telegrams of the canvass of 1876 were handed over to the Senate Committee by the late Mr. Orton, who was an ardent Republican. What Dr. Green says is that they were handed over to the Senate Committee by the Executive Committee, but with the understanding that the House Committee was to have access to them whenever they pleased, an arrangement with which both parties expressed themselves satisfied, and which was intended to save the immense labor of copying them. Mr. Clarence Cary, the lawyer of the company, makes the same explanation on another page. This puts Mr. Orton's course in a better light, but it does not essentially change the situation. The House Committee made no attempt to examine them, we presume because both parties had come to an agreement not to look further into the doings during the canvass, which Mr. Orton told Mr. Hewitt would be found discreditable to both sides. This agreement imposed on Senator Morton the obligation to return the telegrams intact; instead of which they lay in the committee-room, where they were inspected and sorted by Bullock, the clerk, now Consul at Cologne, Brady, the Assistant Postmaster-General, both Indiana henchmen, and other workers, until the Democratic telegrams finally reached the *Tribune*. The transaction from first to last has been worthy of a band of faro-bankers quarrelling over a division of their gains, but the nature of the discoveries made about Tilden's followers is such that the public is not disposed to trouble itself about the *modus operandi*.

We have discussed elsewhere the investigation of the cipher telegrams conducted by the House Committee in this city. The New York *Times* gives the following deplorable account of Mr. Tilden's personal appearance in the committee-room:

"It was a pitiable spectacle to look at this infirm old man, his expressionless countenance seamed all over with physical decay, his thin, grey hairs straying confusedly in all directions over his poll, his feeble body sunken into a heap, and his transparent hands shaking violently with palsy, mumbling denials which few unprejudiced listeners doubted were untrue, so utterly inconsistent were they with the ordinary circumstances of every-day life. Every few moments—often in the middle of a sentence—he would stop for breath, and would then go on without inflection or indication of any kind that any other faculty of his mind than his memory was in play."

What is most interesting in this is the fact of the memory continuing to work after the other faculties had been impaired. Usually, indeed almost invariably, the memory is the first to go, and what is most painful in the condition of these rascally old dotards is that they remember little or nothing unless stirred up with a cudgel. Another curious feature in Mr. Tilden's condition as here described is that such a helpless old fellow should be a powerful and indefatigable railroad wrecker and speculator and intriguer, and be actively engaged even now in all manner of wickedness. How does he manage to be such an energetic evil-doer, as the *Times* often assures us that he is, with "his feeble body sunk into a heap" and "his hands shaking violently with the palsy"? Here is a question for the neurologists.

Henry Ward Beecher also "took a whack at him" in his sermon on Sunday, calling him "an old crafty paralytic." The sermon was highly pessimistic, relating to the general decay of morality, which the preacher described as "the danger that the foundations of our society and polity may crumble away and let us down into the depths of ruin," which is certainly an awful prospect. Mr. Beecher takes a far more serious view of bulldozing than of cheating in the count, and sneers bitterly at those who are not troubled about election terrorism but are troubled about the Returning Board trickery, using, he says sarcastically, "the conscience of arithmetic," which he evidently thinks a mean thing. The sermon calls for two observations: one is that Mr. Tilden is in a position of which Mr. Beecher has had painful experience—that of a man who has little but his naked assertion to oppose to powerful circumstantial and documentary evidence of guilt, and therefore deserves at *his* hands, at least, exemption from vituperative moralizing. The other is that bulldozing and other forms of violence are not characteristics of our age or nation. They are the sins of small districts in a low stage of civilization, and are sure to pass away before long, because population, industry, trade, and wealth kill them. Returning-Board trickery, or, as Mr. Beecher calls it, making "two and two into five" is, on the other hand, the vice of the period *par excellence*, and is confined to no State or section. It flourishes most where the arts are found in most perfection, and where schools and churches most abound. Some of its most eminent practitioners, indeed, are prominent pewholders, and applaud most lustily when hearty preachers are pitching into the Louisiana "red-shirts." If there be anything that is going "to plunge us into the depths of ruin" it is this, and our best if not only defence against it is "the conscience of arithmetic," which is more shocked by the spectacle of a band of official scoundrels doctoring returns and cooking accounts, than by a band of ruffians fighting on the highway. It is this conscience which preachers need just now to preach with most pounding of the cushion. Nobody in Mr. Beecher's church is at all tempted to go out and bulldoze, but his sheep are all more or less tempted to make five out of two and two, and were we in his place we would carefully cultivate the "arithmetical conscience," feeling assured that the other conscience, which takes charge of distant crimes and outrages committed by other people one thousand miles away, will grow beautifully without other nutriment than coffee and cakes.

The Congressional doings of the week have been of some importance. The Democratic substitute for Mr. Edmunds's resolutions was rejected on Wednesday week by a party vote of 23 to 16, after amendment by Mr. Edmunds in these words:

"That the right of the people peaceably to assemble for the purpose of petitioning Congress for a redress of grievances, or for anything else connected with the powers and duties of the National Government, is an attribute of national citizenship, and as such under the protection of and guaranteed by the United States, and within the scope of the sovereignty of the United States to protect by penal laws."

Mr. Edmunds's resolutions were then adopted separately by about the same vote. So the Judiciary Committee stands instructed to prepare a bill to protect citizens in their right to vote for Representatives in Congress. The gist of the debate we have considered elsewhere. On Thursday the Senate passed, by 46 to 4, the new bill in regard to the taking of the census which has been prepared with the aid of the Superintendent of the Census, and is a vast improvement on the law of 1850, though Mr. Conkling, who voted with the minority, thought there was no need of a change. Mr. Conkling seldom misses an opportunity to show his utter indifference to the commercial interests of the great State whose servant he nominally is, and he was not ashamed to declare his opinion that the object of a census was to reapportion representation in Congress and not to secure "all sorts of statistics." The enumeration is to occupy the month of June, 1880. On Friday, by 40 to 20, Mr. Edmunds dissenting among the rest, the Senate passed a bill that had been re-

ported adversely by the Judiciary Committee, and in accordance with which women are to be admitted to practise before the Supreme Court after three years' practice before the highest court of any State or Territory, and upon certificate of good standing and good moral character. This measure had already been passed by the House. On Monday the Senate passed the House Certificate of Deposit Bill, amended so as to make the interest 4 per cent. instead of 3. For convenience the Treasury would have preferred 3.65.

The House on its part has been chiefly engaged with the Army Appropriation Bill, which it passed on Saturday. The reorganization details of the Burnside Bill were substituted by a party vote of 116 to 92 in place of the section which, by stopping promotion, left those details to be settled by a future Congress. The present vote will not, however, have the opposite effect, for there is very little doubt that the Senate will resist the new legislation of this bill, and that a Conference Committee will not save it. The party which has been clamoring so long for army reduction has, meantime, saved its character for sincerity, and will be satisfied to have done so. Another amendment to the bill was one offered by Mr. Hewitt, repealing that section of the Revised Statutes which authorizes troops to be stationed at the polls on election day; this was carried by 110 to 95. An amendment involving the transfer of the Indian Bureau to the War Department was defeated, in Committee of the Whole, by 101 to 88. In view of the fact that the reports of the Joint Committee for and against that proposition had been printed, and that there had been both sufficient notice and debate in regard to it, the vote may be taken as a clear indication that the transfer will not be made by the present Congress. It would not be remarkable if the decided change in the views of several of the Democratic members, during the last fortnight, upon this subject were due to the intelligence of the shocking fate of the revolted band of Cheyennes while under military control. An unsuccessful attempt was made on Monday to pass, under suspension of the rules, a bill repealing the statutes providing a test oath for Southern jurors in certain cases, and for the appointment and payment of election and special deputy-marshals. The supporters of the Sugar Bill proved strong enough to get to-day fixed for its consideration. The discussion of the Legislative, Executive, and Judicial Appropriation Bill was begun.

The Democratic caucus in Congress decided on Saturday to tack on to this Appropriation Bill a repeal of the act compelling persons to swear that they have not borne arms against the Union as a qualification for service on juries, and also of the Federal Election law, in order to coerce the Senate and President, through the dislike of an extra session. It was alleged in the caucus by Senator Thurman that these acts, or one of them, had been passed by the Republicans in this way, and that therefore there could be no impropriety in adopting this mode of repealing them. It is, perhaps, an exaggeration, but not much of an exaggeration, to call schemes of this sort revolutionary, and Mr. Thurman's leading them shows that he has completely lost his head. Mr. Bayard opposed the plan, and it appears that the caucus was thinly attended, and that the bulk of the Southern, and the best of the Northern, Democrats decline to be bound by its decisions. The Republicans have, we believe, no objection to the repeal of the Jurors' Test Oath, with which the Southerners would, for the present, be content. There is no need of haste in taking up the Election Law because there will be no election before December, and anyhow the Democrats will commit one of their accustomed follies in proposing its repeal without, at least, offering some substitute for it. In any case, tacking to appropriation bills measures which deserve serious and separate consideration is tricky and unparliamentary, and deserves all the resistance it can receive.

The bill to permit women to practise before the Supreme Court at Washington is a measure passed principally for the relief of Mrs. Belva Lockwood's disabilities, she having been engaged in the practice of the law for some time in Washington, debarred by her sex, however, from appearing in the Supreme Court. The bill was carried through mainly by the energetic advocacy of Senators McDonald, Sargent, and Hoar, whose oratorical efforts were reinforced by the presence of "Judge" Lockwood, as she is called in Washington by male reporters, in the gallery. After the struggle was over, all the senators who advocated the bill were "made the recipients" of bouquets, while the three Senators whose names we have given received large baskets of flowers. This is a pleasing omen of that purification of legal business which it is hoped will flow from the introduction of woman into the courts. It was not flowers that used to be distributed at Washington and Albany, in the old corrupt times, among legislators in testimony of gratitude for their votes. Let us hope that venal legislation at Washington will be extirpated by the rise of this beautiful custom. It is pleasant to think of the oratory of "favorite sons" being stimulated by the gentle rivalry as to which of them shall get the most bouquets or the biggest basket of flowers, instead of those lower motives which have had such full play heretofore.

The Navy Investigation has concluded with a majority report from the House Naval Committee, which gives some facts additional to those contained in the issue of the *Nation*, No. 705. During the eight years of Robeson's administration there was appropriated for the United States Navy the sum of $182,409,033. During the same period material was disposed of which cost the Government $100,000,000. Yet, in spite of these great sums at the service of the Department, there existed an indebtedness at the close of Secretary Robeson's term of $7,083,503 25, unwarranted by any law, while there is very little to show for this enormous expenditure. There were last year seventy-four vessels temporarily or permanently unfit for use, and only forty-three in service. The property sold or disposed of could easily have yielded an income of $20,000,000; but, as a matter of fact, the Government received for it something under $2,000,000. The report points out violations of law in too many cases for mention. In the single matter of proposals and purchase from the lowest bidder, the distinct provisions of the law have been disregarded in 850 cases. Other illegal transactions were the making of contracts for which there was no appropriation, advance payments for work not done, and endless corruption and favoritism in the disposal of material belonging to the Government. Ex-Secretary Robeson and several chiefs of bureau are named as the guilty persons, and the Committee demand that they be brought to justice.

The President is said to have written a letter to Collector Merritt informing him that there must be no discrimination against Mr. Arthur's appointees in the Custom-house, which must now be administered on strictly reform principles. We trust this is true. There is little doubt that the effect of the victory in the Senate has been very disheartening to the henchmen, and has done much to dislocate the Machine all over the country. It will doubtless, for this reason, do a good deal to discourage the Grant movement, which is essentially an effort of the Machine to renew its hold on power, and the success of which would be really a formal surrender of the best portion of the better of the two political parties to the worst influences in national politics, and as such would be an immense disaster. It has been feared by many, however, that the President would be so elated by his success in beating Conkling with his own weapons, that he and Sherman would be tempted into showing the world that they were not mere "Sunday-school politicians" after all, but could, if they got their blood up, play as sinful a game as anybody. A sturdy adherence even now at the eleventh hour to the beautiful programme with which Mr. Hayes took office would soon put an end to these discouraging rumors, and would before the next convention do much to revive the reform feeling to which he owed his election.

Elizabeth in the North and Memphis in the South have proclaimed themselves bankrupt. The causes which led them into this

strait are somewhat different, and on the whole more discreditable to the Northern than to the Southern city. During the period of demoralization following the war Memphis fell into the hands of a set of rascals who saddled the city with a large debt by issuing bonds which were sold for about fifty cents on the dollar, and the proceeds of which were either stolen or wasted. This debt and the loss of life and business consequent on the ravages of the yellow fever during the past year have combined to ruin the city financially. Elizabeth, on the other hand, has burdened herself in a manner which admits of no palliation. The city officers have sold bonds for every purpose that their imagination could suggest, from elaborate paving and water-works to providing the means for paying their current expenses, while property has been assessed till more than its value has been paid for improvements of very questionable use. The city officers, however, do not deserve all the blame. For the continued existence of such a state of things there must have been a culpable indifference to public affairs on the part of the tax-payers. As regards the way out of the difficulty, the methods adopted by the two cities will probably be different. At her own request the charter of Memphis has been taken away, and she is no longer a city, a proceeding which is probably unconstitutional, as involving the violation of contracts. The inhabitants seem to regard repudiation with no unfriendly eye, and unless protected by the courts the bondholders will lose everything. Elizabeth, although more inexcusable in the contraction of her liabilities, will no doubt find an honester way to deal with them.

The sales of United States 4 per cent. bonds continue at the rate of about $5,000,000 per day, and notification has been given to the holders of another $20,000,000 5-20 6 per cents that they will be redeemed. This makes $190,000,000 notified for redemption this year. The sales of 4 per cents in Europe are increasing, but they are not yet sufficient in amount to offset in the foreign exchanges the 5-20 bonds ordered from Europe for redemption. Accordingly, the market for foreign exchange is strong, and the rates for bankers' sterling have been advanced nominally to within half a point of the specie-exporting rate, and actually to within one point of that rate. At the Stock Exchange speculation is not as active as during January, but there is a wonderfully large and sustained demand for railroad investments, and it is evident that a good part of the money coming out of United States 6 per cents is going into railroad securities rather than into United States 4 per cents—proof of a new class of buyers for the latter, inasmuch as the amount of 6 per cents called in is governed by the amount of 4 per cents sold. The money market continues extremely easy for all classes of borrowers. In general trade there is some improvement, but this cannot be measured by the increased activity and advance in prices at the Stock Exchange. The Treasury stopped buying silver deliverable at the Philadelphia Mint, and has given notice that it will buy only small weekly amounts for delivery at New Orleans and San Francisco. In London the price of silver bullion has fallen to 49⅛*d.* to 49⅝*d.* per ounce; the bullion value of the 412½-grain silver dollar is down to $0.8353.

The British troops have sustained a severe reverse in South Africa, losing over five hundred regulars of the Queen's army and about one hundred of the Colonial troops, and a large quantity of stores. The military situation in that region has been causing a good deal of anxiety ever since the annexation of the Orange Republic of the Dutch Boers two years ago. The Boers, who are a very small settlement, had a quarrel with Secocoeni, a Caffre chief, a sort of vassal, as well as can be made out, of Cetiwayo, the King of the Zulus, the most powerful and warlike of the South African races. The Dutch got the worst of it in the fight, and to prevent their extinction, and the entrance of the victorious savages into the British settlements of Natal, the British Colonial Office annexed the Republic, and warned Secocoeni off. He fell back on his suzerain, who made preparations to support him. After much fighting and bickering, the British Government resolved, in order to restore peace and order on the frontier, to reduce Cetiwayo to the condition of an Indian prince by requiring him to receive a resident and submit himself to a variety of restrictions both in his relations with the colonies and in his manner of governing his own people. As he is a warlike fellow, with an army of forty thousand in organized regiments, fairly disciplined, armed with rifles, and capable in that country of feats of locomotion which Europeans cannot imitate, and as he had hitherto thrashed all his neighbors without difficulty, he disdained to reply, and prepared for war. Lord Chelmsford, the British commander, thereupon marched against him with a small and, as it appears, divided force, on one column of which Cetiwayo threw himself with overwhelming strength and annihilated it. He has since, it is reported, been frequently repulsed, and he probably will find it difficult to keep the field in great numbers, but the white colonists as well as the white army are but a handful in the midst of a vast black population, and the danger is that the rising against them may spread before reinforcements reach the ground either from England or India. It is rather odd that the Zulus should after all prove more formidable foes than the Afghans. The result of the conflict will probably be a considerable extension of the British territory, but at great cost, and it will press against a teeming population, and in a very difficult country. The region, too, is not very attractive to colonists, and the burden of defence will fall almost wholly on the home Government.

The news is bad for the Ministry, as it brings home in an unpleasant way the costliness of an "imperial policy," and brings it home, too, at a moment when the public begins to feel anxious about the future in Afghanistan, where no organized resistance worth mentioning has been encountered, but where no one can take a walk outside of the British sentries without the risk of being murdered. In fact, all the reports from the seat of war go to show that each column holds the ground it camps on and no more. The news of Yakub Khan's submission has not been confirmed. He is at Cabul, but the invaders are afraid to march on him and overthrow him, because they would then have nobody to negotiate with and would have the government of the country on their hands. The Tories have, however, received some solid comfort from the defeat of the Liberals in North Norfolk, a county election at which both parties put forth all their strength, and which the Liberals acknowledged beforehand would show conclusively whether they had made any impression among the farmers. It would seem that they have not, and the explanation now given is that they furnish no positive foreign policy as a substitute for Beaconsfield's. This is the more discouraging as the election came close on a speech of Sir William Harcourt's at Oxford on this policy, which was probably one of the most savage and destructive pieces of political criticism ever uttered —so destructive that no Tory orator or writer even attempted to reply to it. They simply bowed their heads and said it was easy to find fault.

In France the new régime seems to be working smoothly, and M. Grévy is carrying on the programme of the Left by sending procureurs and generals into retirement by the dozen, and the Monarchists have apparently completely abandoned the field, leaving the Republicans face to face with their only remaining enemy, the "Clericals," who seem to be getting ready for the fray which every one feels is sure to come before long, as the Government proposes to withdraw the permission given three years ago to universities to grant their own degrees, and a bill for compulsory secular education by means of severe penalties on parents is before the Assembly. A new champion of the Church has appeared in the person of Bishop Freppel, of Angers, who seems desirous of occupying the late Bishop Dupanloup's position. He commenced operations with one of the most effective weapons of ecclesiastical warfare, by praying for the Chambers, when the session opened, in a bitter and minatory way, and he has defied the law by publishing the Pope's Encyclical without state permission.

THE CIPHER TELEGRAMS INVESTIGATION.

MR. TILDEN, as well as Messrs. Marble and Pelton, have been examined by the Potter Committee in this city, and with what we may call the anticipated result. Mr. Tilden denied in the most sweeping way all knowledge both of the telegrams deciphered by the *Tribune* and of the transactions to which those telegrams referred. He acknowledged, however, that he did learn at the time of Pelton's having gone to Baltimore in November, 1876, to negotiate with somebody for the purchase of a vote or votes of the South Carolina Returning Board, but declared that he had expressed his displeasure to his informant, Mr. Edward Cooper, and had directed Pelton to be recalled at once. This furnished the only matter by which any impression whatever was made on his testimony in cross-examination, for it was pointed out to him, and we think with success, that his card addressed to the public in October last, denying all knowledge of the cipher telegrams, was so worded as to convey the impression that he had not, until these telegrams were published, heard anything of any attempts to buy or sell the votes of any of the Returning Boards. But this must be judged with reference to his idiosyncrasies, one of which is the habit of not writing anything that is not strictly necessary to cover the case. It also came out in cross-examination that his displeasure with Pelton for his Baltimore operations was not shown in any violent or even impressive way. This is hardly of great importance, because it is not the custom of men in public life to denounce "workers" for being dishonest in their own service with any great vehemence, even when they dislike it; and, if we are not mistaken, there is no case on record of a Good Man in politics having repudiated a Wicked Partner until he was publicly found out. Allowance, too, has to be made for differences of temperament, in judging men's ways of expressing disapproval. Feelings which in one man find vent in profane language, in another simply produce sadness of countenance.

As to Pelton, he confessed everything, and so did Smith Weed. Marble got on very well, by representing his telegrams communicating the offers to sell as "danger signals" and pieces of news, until he reached those in which he was informed by Pelton that "the proposition was accepted, if done only once," and in which he, as is alleged, replied that "the proposition had failed." Pelton swore that the first of these was an authorization to Marble to buy, on certain terms, and that he did not raise the money because of the second, in which Marble announced to him that the negotiations had broken down. Mr. Marble's denial of this explanation and inability to offer any other, and his inability to explain the despatch alleged to have been received by him—"Despatch here; proposition too high"—may be said to have been fatal to his evidence. This ignorance or forgetfulness as to these two despatches, taken in connection with the despatches he acknowledged and Pelton's confession, seem to make out pretty clearly that he was engaged in a negotiation for the purchase of the Presidency which, for some reason not revealed, failed. The whole of his evidence is not worth analyzing, and is of little or no interest to the public, which is getting thoroughly tired of the whole matter.

As to the effect likely to be produced by Mr. Tilden's testimony, we think it will with each reader have the weight of Mr. Tilden's word. That is, it will impress favorably those who trust him, and will seem to those who do not trust him simply an addition to the list of his sins. Looking at the matter in the light of surrounding circumstances, and in the light of Pelton's character, which was well known to him, and in the light of his own manner of doing business, most people will find it difficult to believe that he did not perceive the possibility of something wrong, or that he had determined to do anything by way of prevention beyond repressing whatever was brought to his knowledge, or that had he obtained the Presidency he would have been much surprised or troubled if he had learnt, after his election, that some of his votes had been paid for. His allowing Pelton, with the knowledge he already possessed of his character, to rove about on political business, and even appear to represent him, is something which hardly any assertion will dispose of. His statement before the Committee, nevertheless, was skilfully made, and will, we do not doubt, have a certain impressiveness with the rank and file of Democratic voters, though it must have been disappointing to the chiefs, who doubtless looked for something much more crushing. The warmth, in particular, was inserted in the right place, and found expression in vigorous and telling English, which will produce its effect on thousands of rural voters, who will not examine the evidence with a critical eye. One thrust in it was most dexterous, and must have disconcerted the Republican members of the Committee, if one may judge from the pains they took to meet it—we mean the solemn asseveration "before God and his country" that the votes of Florida, South Carolina, and Louisiana had been bought. He was, however, able to adduce no proof of this beyond what was known to all the world. The strongest fact he had—a fact, however, which anywhere but in "politics" would be serious, if not fatal—was McLin's receiving a nomination to permanent office, a chief-justiceship in New Mexico, from the person in whose favor he had, in the exercise of judicial functions, given a discretionary casting vote for the Presidency. In any other field than politics, as we have said, this would be called a sale; and there have been several incidents of the same sort. In fact, on a calm survey of all the evidence which has been produced with regard to the occurrences in the three disputed States between the day of the vote in 1876 and the Congressional count in 1877, it is all but impossible to avoid the conclusion that some of the workers on both sides were engaged in attempts to corrupt the Returning Boards, the Democrats with offers of money and the Republicans with promises of office; that the latter owed their success to the fact that, other things being equal, the sympathies of the members of the Board were with them; and that a proffer of good situations from the party actually in power seemed both surer than a naked offer of money from the party in opposition and much more attractive, because the receipt of money would, if discovered, entail infamy if not criminal prosecution, while the receipt of office would be treated as harmless if not praiseworthy. Mr. Tilden's people could, of course, have promised McLin a chief-justiceship just as well as Mr. Hayes's, and McLin might have put it in Tilden's power to bestow it; but, as we have said, despicable a person as we now know McLin to be, he doubtless had feeling and conviction enough to prefer Hayes to Tilden, *cæteris paribus;* besides which, McLin being a Republican, Tilden could not have given him office at the South without confessing illicit relations with him.

The Republicans have, with a naïveté which has not of late years been characteristic of them, helped to strengthen this view by their manner of pushing the case against Pelton and Marble and the other "coparceners." They apparently have not perceived, in their eagerness to convince the country of Democratic dishonesty, that the more clearly they show these worthies to have been engaged in negotiations for the purchase of the Presidency—negotiations which, according to the *Tribune*, only failed in South Carolina by the Providential miscarriage of a despatch—the more clearly do they prove the venality of the Returning Boards, and the more unlikely do they make it seem that these Boards gave Mr. Hayes out of pure love of justice what they had tried to sell to Mr. Tilden for cash. A glimpse of the consequences of this blunder seems to have been vouchsafed to some Republicans at the eleventh hour, for immediately after the close of Mr. Tilden's evidence a writer in the *Times* made a labored attempt to prove that members of the Boards were not venal, but honest though poor citizens; but it was hardly worth examination. The public, we are satisfied, has now had enough of the whole matter. The exposure has probably and deservedly ruined Mr. Tilden's chances of another nomination, but it is not likely to have any other result of much public importance beyond intensifying the popular determination that the opportunity for these shocking scandals shall not recur, that some means shall be devised of deciding conflicting claims to the Presidency which will make it unnecessary to treat the candidates and their friends as common criminals, and to weigh their acts in scales usually reserved for the burglar and the counterfeiter.

THE FEDERAL GOVERNMENT AND THE COLORED VOTERS.

THE debates in the Senate during the past fortnight on Mr. Edmunds's resolutions have been very interesting. They contain a very free and full exposition of the position which both parties have reached on the question of the relation which the recent Constitutional Amendments have created between the Federal Government and the voters of the various States. It is acknowledged on all hands that the precautions taken by the Republican party while in power for the protection of the freedmen of the South in the exercise of the suffrage have proved insufficient, and that if they are to be protected in it at all by other agencies than their own physical and moral force something new will have to be resorted to. Carpet-baggery has been tried and has proved futile; so has the machinery for the supervision of elections created by Federal statutes already enacted, and it is clear that even in the States in which the negroes are in the majority neither their opinion nor physical force is equal to the task in the teeth of white Democratic hostility. That this should be a source of anxiety not unmixed with mortification to the best class of Republicans is natural enough. The party emancipated the negroes on its own motion, and at the close of the war deliberately resolved to meet the responsibility imposed by the fact that the freedmen were to be left in the power of their late masters, by insisting that the suffrage should be given them. This was probably the best course open under the peculiar restrictions imposed on the Federal Government by the semi-independence of the States. By no government would slaves so emancipated have been left completely under the control of their late owners. Any Government in the world possessing complete sovereignty would have protected them by means of a magistracy and police of its own, armed with extensive powers. The Republican party tried to reach the same ends by means more in harmony with American traditions and feelings, and, in fact, by the only means which American polity seemed to leave within its reach. As these have proved ineffectual, it is not unnatural, now that the party seems to be losing its hold on power, that it should try whether it cannot come to some understanding with the Democrats by which its pledges to the Southern colored voters would be redeemed; and Mr. Edmunds's resolutions in the Senate have looked like the opening of negotiations for this purpose. They pronounce the three last amendments valid, declare that the people of each State have an interest in the enforcement of the Constitution in every other, call on Congress to supply such legislation as may be needed to protect citizens in the enjoyment of the rights secured by these amendments, and instruct the Judiciary Committee to report a bill for the full and impartial protection of all citizens legally qualified in the right to vote for representatives in Congress.

To this Mr. Morgan, of Alabama, replied on behalf of the Democrats by an amendment acknowledging the validity of the Amendments, but affirming the restrictions placed on the power of the United States by the Constitution, and declaring that the United States has not conferred, and cannot confer, the right of suffrage on any one; that the Fifteenth Amendment has bestowed on the citizens of the United States a new Constitutional right—that of exemption from discrimination on account of race, color, or previous condition of servitude; and that while Congress may legislate to prevent the denial or abridgment of this right by a State when such denial or abridgment is on account of race, color, or previous condition of servitude, if such right is denied or abridged by any one not acting by the authority of or in obedience to the laws of a State the duty of punishing such interference rests with the State, and not with the general Government.

The debate showed that there was really no substantial difference of opinion between Mr. Morgan and Mr. Edmunds, except on one point—viz., what constitutes a denial or abridgment of the right to vote; the Democrats holding that to warrant the interference of the Federal Government there must be denial or abridgment by a State law; the Republicans, that there need only be a failure or omission on the part of the State to provide protection for the voters, whether such failure or omission shows itself in the absence of proper legislation, or in the misconduct of the courts, or in the inefficiency of the police. There is, of course, no State legislation denying any one's right to vote on account of race, color, or previous condition of servitude, and it is not likely there ever will be; but the exercise of the right has been prevented, and probably will be frequently again, by unpunished or unpunishable fraud or violence, or by unfair polling arrangements. The United States Government, therefore, Mr. Edmunds holds, should make provision for the proper conduct of Congressional elections and for the protection of persons voting or desiring to vote at them. He even intimated that they should also provide for the free exercise of the right "to assemble peaceably to petition for the redress of grievances," or, in other words, should provide police protection for public meetings held in anticipation of Congressional or Presidential elections, and should punish all attempts to disturb or prevent such meetings. There is undoubtedly in the Republican party a widespread and deeply-seated feeling that some such assertion of power on the part of the United States is due to the colored voters whom the party has called into existence. It is probably the only strong sentiment or opinion in any particular direction now to be found in the party, and it is the sentiment which is appealed to by the process called "waving the bloody shirt"—that is, collecting stories of disorders and outrages at the South, and presenting them in exaggerated and inflammatory language.

We have said that the debate was interesting, meaning for the expressions of opinion that it brought out. But we must also add, that the fact that Mr. Edmunds's resolutions were introduced after the recess in the last session of the present Congress, when there was no chance of their resulting even in an attempt at legislation, that thirty-seven Senators did not vote on them, and only three or four took part in the discussion, seems to show that after all the subject, in spite of its gravity, does not really take hold of the mind of politicians on either side with any seriousness. The chief object of the resolutions, indeed, like the Teller investigation, seems to have been the successful performance of the bit of electioneering known as "putting the Democrats on record" as the enemies of something or other. There was, too, running through the speeches on both sides an evasion of the real facts of the case, and a curious cherishing of an unfounded hypothesis. Mr. Edmunds, for instance, took it for granted in all his remarks that the legislation he called for was needed in every State in the Union; that, in them all, large bodies of persons were liable to be prevented from voting by force or fraud, and were not likely to obtain redress or protection either from the public opinion or the legislature or courts of the State; the fact being that in all but six of them the protection of the voter by State law is the same which has existed since the foundation of the Government, and is as perfect, probably, as could be devised. The Democrats, on the other hand, as studiously pretended that there was no state of things in any part of the Union to account for the Republican anxiety to interfere with State machinery, or to extend the jurisdiction of Federal police, and that there was as much need for Mr. Edmunds's proposed legislation in Massachusetts as in South Carolina or in Mississippi. These little fictions gave the controversy an unpleasant resemblance to a sham battle intended to amuse or bewilder the bystanders.

If the question of Federal protection for negro voters at the South is ever to get beyond the stage of an electioneering cry in the mouths of sensational reporters, or that of a theme for constitutional dialecticians, it will be through what we have not yet had, and what the Republican leaders are bound in honor to give us—viz., a resolute facing and passionless discussion of the details of any proposed system of Federal interference. The negro voters being for the most part a poor and dependent and credulous class, how is the subtle and effectual intimidation of creditors, landlords, and employers to be *legally* met? How is the practice of spreading frightful stories among them about the consequences of voting to be put down? How are juries to be got to punish infractions of Federal election laws, except by packing them? How are we to secure

respect for Federal election laws as long as their administration is entrusted, as at present under party usage, to political partisans, whose bread is dependent on making the election turn one way and not the other? These questions all relate to the practicability of Federal interference when once decided on. But take the still more serious question: By what marks or signs are we to know when the contingency has arisen which, according to Senator Edmunds, will make it Constitutional, under the Fifteenth Amendment, for the Federal Government to interfere in State elections, namely, the refusal or neglect of a State to provide proper protection for the voters? How *much* inefficiency on the part of the courts or police is to create the contingency, and who is to gauge it? Would it be possible to appoint any person to gauge it without in practice giving him a supervision of the entire government of the State? The conduct of trial-justices, for instance, in dealing with assault and battery might very properly be held accountable for a heavy falling off in the vote on one side; are we prepared for this reason to assume the administration of general criminal justice in every State in which the party in power is not satisfied with the result of the election? We might multiply these questions indefinitely. Others of a similar character will occur by the dozen to every thinking man. The instructions of the Edmunds resolutions to the Judiciary Committee to prepare a bill, if given earlier in the session, would have furnished us before now, and it may furnish us by next December, with the plan in detail by which the Republicans expect to solve these problems. If it does so it will be most useful in bringing down the party mind to the facts of life, and putting a check on the vague declamation in which the whole subject of negro voting is now involved. It will submit also to the people in black and white the momentous question, whether they are willing to make a fundamental change in their system of government in order to put an end, in four or five States out of thirty-eight, to disorders which there is strong reason to believe are transitory, and the chief causes of which are gradually disappearing before our eyes.

THE JOHN ROACH SUBSIDY.

IT is known to the public through the maritime columns of the daily press and otherwise that a line of steamers is plying between the port of New York and that of Rio de Janeiro, touching at some intermediate stations in the West Indies and on the coast of South America. The arrivals and departures of the steamers, and the manifests of their cargoes, have been noted as encouraging signs of an increasing trade with the empire of Brazil—a trade which had supported a numerous fleet of sailing craft at the port of Baltimore for more than a quarter of a century, and which had given rise to regular steam communication between New York and Rio before the line here mentioned, commonly called John Roach's line, was put in operation. It is known, also, through the columns of the *Congressional Record*, that Mr. Roach's line was built for the purpose of obtaining subsidies from the Governments of Brazil and the United States, and that the subsidy from the latter was not secured in time to reward the enterprising owner in advance of the launching of his ships. It is stated, also, that the Government of Brazil refuses to commence paying subsidy until the United States does the same, the result of which unreasonable obstinacy is that Mr. Roach has been running steamers between New York and Rio ten or twelve months on the same terms as other people run steamers on other lines. In the way of dollars and cents this would not have been a losing operation, probably, if Mr. Roach had not been "running" other expensive things at the same time, and particularly a number of commercial conventions, so-called, whose highest idea of commerce turned out, after voluminous debate, to be an appropriation from the national Treasury to Mr. Roach. The cost of these conventions and of other assistance usually brought into requisition when money is wanted from Congress has probably eaten largely into the commercial returns of the steamship venture. We are not surprised, therefore, to learn that redoubled exertions are put forth to secure the subsidy before the adjournment of Congress, because if Mr. Roach should be put to the expense of holding another series of commercial conventions, and supporting a corps of lobbyists during the long vacation, the entire receipts of his steamers and his ship-yard might be exhausted, and himself left in no better plight than the forty-six thousand persons and firms who, according to the reports of Dun, Barlow & Co., have fallen victims to bad trade and bad speculations since 1873.

During the session of Congress which closed in the month of June last, Mr. Roach's subsidy was tacked upon the Post Route Bill by the Senate after a vain effort had been made to pass it through the House as an independent measure. The usual methods of "log-rolling" were brought in requisition with cool effrontery. New Orleans, Galveston, and Norfolk were successively lugged into the bill as entrepôts of Brazilian trade, in order to gain Southern votes. Pennsylvania was supposed to be sufficiently paid by having the ships built within her limits, and most of the trades which have been "protected" into a condition of glut by tariff legislation fancied that they saw an outlet for their surplus products in Brazil, and had likewise a fellow-feeling for anybody who noisily asserted his right to lean upon the public taxes for support. This association of local and class interests finally commanded a majority vote in the Senate, but the opponents of the measure in the House raised a point of order or privilege that the Senate had no right to originate an appropriation bill—the Post Route Bill being merely a measure to establish lines of postal service, the appropriations for which are provided in another bill. Whether the point was well or ill taken it sufficed to defeat the scheme for that session, and Mr. Roach was left with two new steamers on his hands which he must either tie up to the dock or send out upon some ocean to take a share in the carrying trade of the world, on even terms with his neighbors.

Prior to this misadventure the cry of the subsidy-hunters had been for a steam line to Brazil. They now have that boon—have had it a long time—but, strange to say, they still talk as though the steamers *City of Rio* and *City of Pará* were non-existent, as though it were impossible to send a mail-bag or a pound of freight to South America by steam unless the Government of the United States shall vote $300,000 per year for ten years, and secure a like sum to be contributed by Brazil, in which case we shall presently see steamers of an approved pattern and tonnage take their place upon the proposed route, and ply with regularity between New York and Rio, and perhaps other ports. So long as there was no line of this sort in operation the usual subsidy argument, whether good or bad in itself, applied to the case in hand. All the force that there is in the supposed need of opening new channels of commerce by public contributions might be logically advanced in support of this claim so long as the channel itself remained unopened. If it were proposed, for instance, to subsidize a line from some American port to Lisbon, or Marseilles, or the Cape of Good Hope, the argument would hold—it would be good for something—it would at least furnish ground for debate. But in a case where steamers are already provided, where a line is in successful operation, where the mails are reaching their destination with regularity, and where berth-room is provided for all the freight offering, that particular argument ceases to have any value or pertinence. We are surprised that so eminent a logician as the Secretary of State does not see the rickety condition of his major premiss.

To bring this within the common understanding it is necessary to add that if Mr. Roach does not get a subsidy he will withdraw the line, and that nobody will step in to fill it. It is not pretended that he had any promise beforehand that he should have a subsidy from us, for Congress was the only authority capable, under our Government, of giving such a promise. What he has done he has done upon his sole responsibility, and he has no more claim upon the Government to reimburse him for his losses, if he has suffered any, than any one of the forty-six thousand bankrupts chronicled by Dun, Barlow & Co. But neither is it asserted that he has incurred any losses in running his steamers, and he is very far from being a bankrupt He has a prohibitory tariff to help him in his trade of

ship-building where other protected manufacturers have only a beggarly sixty or seventy per cent., and he has enjoyed, according to the report of the House Naval Committee, other great advantages in trading with the United States under the auspices of Mr. Geo. M. Robeson.

We can see nothing in this subsidy scheme but a return to the worst examples of legislative barter, which were supposed to have been for ever banished from Washington City when the Pacific Mail and Crédit Mobilier jobs were exposed to public indignation. When the secret history of these transactions came to light both political parties made haste to put the seal of condemnation upon all manner of subsidies in their national and State platforms. It was justly held that under our form of government, with its divided responsibility and its rotating administration and civil service, a system of public largesses to private individuals and companies would expose the Treasury to certain pillage, convert the halls of Congress into auction-rooms, and demoralize every department of the Government; and since no sure line could be drawn between one kind of subsidy and another kind, between a railroad and a steamship, between Mr. John Roach and Col. Tom Scott, between Brazilian steamers and Australian steamers, the whole system must be knocked on the head. This was the spirit in which both Republicans and Democrats attacked subsidies and subsidy legislation a few years ago. It is now pertinent to enquire what has become of the good resolutions to which both parties were so solemnly pledged? How does it happen that a majority of the Senate is found ready to reopen the offensive chapter which was closed by common consent when the Sergeant-at-Arms was pursuing the scampering rogues of Pacific Mail and Pacific Railroad from Texas to Canada? These questions ought to receive some answer when the honorable gentlemen who now vote for Mr. Roach's bill meet their constituents.

As for Mr. Roach himself, his perseverance at Washington is not without reason. If it be true that the Brazilian Government is pledged to commence paying him subsidy-money whenever the United States shall do the same, then every dollar which he gets from our Government counts two for himself, and leaves him an ample fund to pay the expenses of his rather protracted campaign. If he succeeds, others will be entitled to demand similar favors. There are other American shipyards capable of enlivening the ocean with the stars-and-stripes, and other ports besides those mentioned in the pending bill whose commerce might be enlarged by adequate appropriations of public money. Before a final vote is taken, however, it would be decent to enquire how much money is really needed over and above its own earnings from freight and passengers to keep the line going. Nobody has thought it worth while as yet to ask this question. We presume there are some honest supporters of this subsidy—some who believe in subsidies generally, and who think that this one is designed and calculated for the public advantage. Such persons will agree that it is desirable upon all grounds, and necessary to their own vindication hereafter, that no more should be paid than is clearly necessary; and since the data are now within reach for determining exactly what is necessary, we shall expect this class of supporters of the bill to call for an investigation of the receipts and expenses of Mr. Roach's steamers, and of the cost of steam navigation at the present rates of wages and supplies, before committing the Government to a ten years' contract at a lump sum.

THE WINTER EXHIBITIONS IN LONDON.

London, January 25, 1879.

ONE of the pleasantest incidents of the dusky London winter has for some years been the opening of the loan collection of works by deceased masters of the British and the foreign schools in the spacious rooms of the Royal Academy, the rooms which three or four months later are occupied by that very different and, it must be confessed, very inferior congregation of pictures for which they were especially designed. For the last two winters the entertainment of the art-loving and fog-smitten Londoner has received a notable addition in the institution of the loan collection at the Grosvenor Gallery. As this latter enterprise is supposed to compete with the Academy in May and June, so it attempts at the present season a harmless, but not ineffective, rivalry. It must be admitted, however, that this season the Academy has had no trouble in making the finer show. It has the great advantage of being able to draw upon the state collections. This year, for instance, some of its most valuable contributions are from the stores of the two universities and the great art-treasure belonging to the Crown. The Grosvenor Gallery is obliged to depend upon the good-will of individuals, and though the private art-wealth of England is enormous, it rarely happens that the Queen, whose liberality in sending up her pictures and drawings is extreme, is not able to lay down the trump-card. It must be added, on the other hand, that in the department of paintings the Academy shows marked symptoms of having exhausted the great field which it has laid under contribution. There are, doubtless, a great many fine old pictures in England which have never been seen in Burlington House; but from the moment their owners are unwilling to part with them for a couple of months they may be left out of the question. The available contributions are running thin; the cream of the affair has been drained off. There are some very poor contributions on the line, and, though there are some interesting things as well, there is almost nothing of really brilliant merit. The strong feature at Burlington House this year is the department of drawings, the Academy evidently having been put on its mettle by last winter's fine show of drawings at the Grosvenor. By the production of Raphaels, Michael Angelos, and Leonardos by the dozen it has done something to enfeeble the public recollection of that charming exhibition.

There are always a good many portraits at Burlington House, and for two or three years past there has been a successful attempt to gather together those of the British school. Sir Joshuas and Gainsboroughs, Lawrences, Romneys, and Raeburns have covered the walls, and have made on the whole a very brilliant show. But this year the portraiture is very feeble, and there is nothing enlivening in an assemblage of inferior specimens of the artists we have named. The painters of the first rank—the mighty masters—may be still impressive in their weaker hours, but there is little entertainment to be derived from a second-rate Romney, and an unsuccessful Gainsborough is not a profitable spectacle. It is hard sometimes to resist the impression that Gainsborough is an overrated painter, the number of his failures is so large and their quality is so very poor. His sketchiness and his want of science transcend the limits of the allowable, and, to keep him at all in favor, the memory needs to fix itself upon his few perfect works—the "Blue Boy," the "Miss Graham," the "Mrs. Siddons," the "Parish Clerk" at the National Gallery. Of the Romneys this year there is little to be said; they are the products of a very primitive degree of skill. The Sir Joshuas, in spite of an interesting and substantial portrait of Charles James Fox, which has, however, "gone off," as they say here, very much in color, are not of importance, and the single Lawrence, a portrait of a very pretty young lady with vermilion cheeks and chin and bead-like eyes, is an example of the least satisfactory phase of the painter's graceful ability. There is a charming head by Hoppner of a certain most sweet-faced Lady Elizabeth Compton; but it is difficult to feel much enthusiasm about Hoppner, and one's admiration here is for the delightful English beauty of the model rather than for the respectable sobriety of the artist. There are also, as usual, several Vandykes, but they are by no means first-rate examples—one of them in particular, an enormous portrait of the Doge Andrea Spinola, clad in crimson robes of extraordinary voluminosity, being, in spite of its showiness and the refined, distinguished head of the model, a light piece of painting. One of the three or four things in the exhibition which have given me personally most pleasure is an admirable portrait by Franz Hals, which is accompanied by a couple of portraits by Van der Helst, rather below this strong painter's usual high level. The Franz Hals is a truly delectable picture—a plain-faced, manly Dutch burgomaster, standing upright in his fluted ruff and his black cloak, and looking out at posterity with the most vivid sagacity and *bonhomie*. Such pictures as this excellent Franz Hals, executed with such a quiet mastery of the painter's means, such a keen enjoyment of them too and yet such an absence of *bravura* and coquetry, renew one's appreciation of good work. Such a picture, again, casts a rather edifying light upon those unfortunate specimens of the English school of which I just spoke—it makes their sketchiness and their want of science seem still more characteristic. The spectator feels that a fine Franz Hals, though it is not by any means one of the most beautiful pictures possible, is the product of a people among whom, at a certain moment, the sentiment of art reached a pecu-

liar intensity. The Romneys, the Gainsboroughs, even the Sir Joshuas, emanate from a society in which, at no time, the sentiment of art has been intense. One may say even that a general scrutiny of the matter throws a sort of ironical light upon these latter works. The English painters were fortunate; they were highly paid; they were patronized by a splendid aristocracy; their models belonged to the handsomest race in the world; their pictures suggest all the proper ideas of British gentility and morality, of that combination of luxury and propriety which is one of the most striking achievements of English civilization. But, as painters, they lacked the last initiation; it is only by courtesy that we call them masters. The Dutch painters, on the other hand, were limited and professional, vulgar and *bourgeois;* their models were for the most part extremely ugly, and their inspiration was homely and frugal. But with all this they are masters. One must add that they have never lacked recognition in England, and the most valuable part of the winter exhibitions at Burlington House is apt to be the small Dutch pieces. There are several capital ones this year—Gerard Dows, Metzus, Van Ostades, Jan Steens. There is a superb example of the last-named painter, a villager seated at table with his wife and child and saying grace over a simple repast of bread and cheese, in which the painting of the accessories—notably of a certain coarse, dirty towel which occupies a considerable share of the foreground—is a marvel of loving finish. One is sure that Jan Steen loved, as a painter, his dirty towel. There is a certain number of agreeable small landscapes—Ruysdaels, Claudes, Gaspres, Poussins—the Ruysdaels, indeed, include a large attributive specimen of the master on which its owner is not to be purely congratulated. There is a delicious little Hobbema, the property of the Fitzwilliam Museum at Cambridge, and there is a bad big Turner—"Schaffhausen"—in which the falls of the Rhine are represented with an energy which tempts one to dodge, as one passes the picture, to escape from the spray. The Italian room includes a couple of beautiful frost-bitten, slightly livid Botticellis, and a magnificent, genial, natural, devotional, tranquil Gian Bellini, of several figures.

The exhibition of drawings is preceded by a room almost filled with an array of miniatures, chiefly English, and lent by the Duke of Buccleuch. It is a princely collection, and arranged in a manner worthy of it; but the fatigue of looking at these diminutive works of art is such as to have prevented me from taking full cognizance of it. Over the drawings, on the other hand, one would willingly spend many a half-hour. Many of them are from Windsor; a great many others are lent by the Duke of Devonshire, and there are few distinguished Italian hands that are not represented. The most striking feature of the exhibition, however, is perhaps the magnificent series of heads in chalk by Holbein, lent by the Queen. The interest of this noble series of portraits (both of men and women) is that of all Holbein's work—a strong and incorruptible reality, a rendering of the individual outline, of the literal facts and idiosyncrasies of the face, that has never been surpassed. There is surely no one like Holbein for telling us how our forefathers of the early sixteenth century *looked.* It is more than a portraiture: it is almost a betrayal, and we cannot help wondering whether his models, had they apprehended it, would have consented to the unmitigated manner in which he was to perpetuate them. There is something in Holbein's ability that is singularly homogeneous. His process is not interpretation, it is simple rendering, and if in these extraordinary transcripts of strong, natural, simple, expressive faces there is a delightful delicacy, it is almost preponderantly delicacy of hand. The Michael Angelos and Leonardos at the Grosvenor last year were equal, if not superior, to the drawings by these illustrious hands exhibited at present at Burlington House; but there has never been seen in London such a collection of Raphaels. These very numerous sketches—in red and in black chalk, in pencil, in silver-print, in pen and bistre—vary in importance and interest; but they all have a touch of the artist's enchanting grace, and some of them are divinely beautiful.

I have left myself little space to speak of the Grosvenor Gallery. On behalf of the assemblage of modern water-colors of which this year the collection partly consists, this is not greatly to be regretted. The water-colors last year were by defunct masters, and the level of interest was certainly higher. A large number of drawings by Ingres have been lent very kindly by their French possessors, and they were expected, I believe, to form one of the attractions of the exhibition. They are perhaps a little disappointing; but they are nevertheless of interest. They are for the most part small portraits in pencil, marked by the painter's clean, pure, dry precision of outline; and they are characteristic of the artist, just as they are charactistic of the good ugly French faces, full of point and vivacity, which they represent.

Correspondence.

THE LATE MR. ORTON AND THE CIPHER DESPATCHES.

To the Editor of The Nation:

Sir: Your issue of the 30th ult., in referring to the evidence taken before the Potter Committee concerning the campaign telegrams, remarks that "Mr. Orton managed dexterously to avoid surrendering them to the House Committee, but handed them over bodily to the Senate Committee, of which the late Senator Morton was chairman."

In justice to Mr. Orton's memory, and in fairness to the Company of which he was the president, please concede me space to state briefly certain facts in this connection, which may be verified by reference to the *Congressional Record*, and which, I submit, fully meet the grave charge of improper political bias and partiality implied in your article.

The surrender of the messages to the Senate (Morton) Committee was not made by Mr. Orton, but by the Telegraph Company's Executive Committee—which was composed of Democrats and Republicans in about equal numbers—and was not so made until after it had been decided by a Conference Committee, composed of sub-committees of the Senate (or Morton) and House (or Proctor Knott) Committees, that the Senate Committee, under a prior subpœna, was *first entitled to demand and receive the telegrams.* Even then the surrender was not carried out until after the Company had offered to supply the House Committees with certified copies of all the telegrams which were to be delivered up to the Senate Committee—an offer which, with the safeguard its acceptance would have afforded, was not availed of.

On the 15th of January, 1877, Mr. Orton's answer in the House contempt proceedings against him was read in the House of Representatives, disclosing the fact that the political messages were then, and for a month had been, in the custody and control of the Company's Executive Committee, and that that body alone had capacity to produce them. That night the Senate (Morton) Committee sent its Sergeant-at-Arms to New York, and on the next morning (January 16) he served here the drag-net subpœna which compelled the attendance of the Executive Committee at Washington, and secured the surrender of the telegrams. The House Committee was less energetic, and did not serve any like subpœna until after the arrival of the Executive Committee in Washington on the evening of the 17th.

I am, very respectfully, etc.,

Clarence Cary.

Offices of the Western Union Telegraph Company,
New York, February 11, 1879.

THE CROW INDIANS AND THEIR NEIGHBORS.

To the Editor of The Nation:

Sir: In your Washington correspondence of December 28, relative to the transfer of the management of Indian affairs from the Interior to the War Department, you state twice as one of the principal causes of Indian wars "the tendency of the frontier white population to encroach on the lands of the Indians and to provoke Indian wars with a view to getting some of their lands." It is hardly possible to read an article in any Eastern paper without finding similar statements. On this point there seems to be but one opinion east of the Mississippi, however great the diversity is on every other point connected with the management of Indian affairs. Now, allow me to state a few facts bearing upon this subject.

I have lived nine years within twenty-five miles of the reservation of the Crows, and spent one year on the reservation, trading with the Indians; so that I have certainly had sufficiently good opportunities of observing the relations between the whites and the Indians. I do not think that the frontiersmen of Montana have a better reputation for gentleness and loving-kindness towards Indians than other settlers in the far West, and my observations at other points bear me out in the supposition that what I shall state about the character of the intercourse between the Crows and the whites is applicable in most other places. The Crow reservation embraces all that part of Montana lying east and south of the Yellowstone, extending east about twenty-five miles beyond the Big Horn. It embraces some of the finest agricultural and grazing lands of the Territory, and valuable mineral lands. It bars our front door, compelling us to make a detour of several hundred miles and enter through the back door by way of Ogden and the barren Snake River country.

Until the abandonment of Forts Phil. Kearney and C. F. Smith the bulk of the overland immigration took the route by these forts, in spite of hostile Sioux and not too friendly Crows; but since they were given up and this Crow reservation established, this road has been practically closed. During the last two years a chain of settlements has been formed along the north bank of the Yellowstone, which is comparatively barren, not being watered by the mountain streams so abundant throughout the reservation. The settlers have been compelled to float saw-logs hundreds of miles down the river to get lumber for their houses, while they could stand in their doors and see forests of pine opposite to them on the south bank of the river. You will see that this reservation is of importance to us, and we do not disguise the fact that we want it. We wish to see the Crows removed.

Furthermore, the Crows make hardly any use of their reservation. They visit it every spring to trade and receive their annuities, and the supplies issued keep a few of the laziest families around their agency the whole year to gain a scanty subsistence from the rations allowed them. The greater part of the year they spend on the plains and alkaline bottoms between the Yellowstone and Musselshell Rivers, where immense herds of buffaloes are yet found. The beautiful valleys and grassy table-lands of their own country have only passing attractions for them, while the whites look at it with longing as a veritable Goshen which they can only overlook from the summit of Nebo, without being permitted to enter. Further, until within the last three years continual depredations on the settlements were committed by the Crows. They stole horses, killed cattle, and occasionally a man or two; but then it was only a frontiersman less, perhaps a poor herder or trapper, and didn't amount to much. These depredations were traced to their door; but farther no one was allowed to go, and we could have no redress.

Now, you will admit that it would be difficult to find greater incitements to restless, adventurous men than the Montanians have had to "provoke Indian wars with a view to getting some of their lands," but not one instance has come to my knowledge of injustice being done to the Crows by the white settlers. One encroachment has been made on their lands. In the extreme southwest corner of their reservation, high up in the mountains of the Yellowstone, is a small mining-camp which was there before the reservation was set apart; but it has never caused any trouble, nor have the Crows ever complained of it, although some overzealous agents have occasionally threatened to have the miners removed by force. For several years no Crow has been within fifty miles of this settlement, and it can hardly be considered an encroachment.

Now the Crows are restless, their annuities have been frequently delayed, their supplies have been insufficient or not furnished at all; but, above all, the recent Nez-Percés and Bannock campaigns have instilled in them a great contempt for the power of our Government, and there may be trouble ahead. If it comes it will undoubtedly be said again that the cause was "encroachment by the frontier population"; but it will be utterly false in this case as it has been in so many others. The only real encroachment made has been by the army, when Fort Custer was established on the Little Big-Horn, and it was complained of bitterly by the Crows, but of course to no purpose, although it was very questionable whether it was a judiciously-selected site for a post, and whether the fort would not have answered its purpose equally as well or better if it had been built on the Yellowstone, outside the limits of the Crow reservation.

If our Eastern critics had lived for years on the frontier, exposed to continual raids, losing their stock, having their houses burned, carrying their lives in their hands, seeing their neighbors slaughtered, they would not so thoughtlessly accuse the population of the frontier of inciting Indian wars. Such has been our experience, and I will venture to say that no one who has lived through the Sioux troubles, and witnessed the devastation caused in Montana by the Nez-Percés war, would willingly provoke another Indian war, could he gain the whole Crow reservation by it. I am referring now to the actual settlers of the country. There is another class, hunters, trappers, adventurers, whiskey-traders, and the like, leading a roving life, and often coming in contact with the Indian. There is always some danger of their recklessness leading them into trouble and brawls; but their isolation and wandering habits make it so evidently their own interest to keep on good terms with the Indians, that their quarrels seldom go beyond braggadocio and loud talk.

Among the principal causes of Indian troubles are the following, which I shall state without comment, as my letter is already too long: A too frequent change of agents (the Crows have had four in less than two and a half years); incapacity and inexperience of many agents; too much centralization in Washington and too much circumlocution and red tape; no confidence is put in the agents, and they have no power to act promptly in case of an emergency; failure on the part of Congress to make sufficient appropriations, and restricting those made in such a manner that they are not available for the purposes for which they are needed; dilatoriness in making the appropriations, making it impossible for the department to ship supplies in time to reach the distant agencies before winter makes freighting impossible; failure of contractors to furnish supplies; occasional dishonesty on the part of agents and occasional bad faith on the part of the Government; the credulity and limited intellectual capacity of the Indians, making them easily seduced by other hostile tribes or renegade whites; pure "cussedness" on the part of the Indians.

Finally, the frontiers people are not, as a rule, in favor of a policy of destruction. They are in favor of civilization, if possible. But it is not possible with the present plan of large reservations, where the Indians are allowed to roam almost at will. It is possible only where the Indians are restricted and compelled to abandon a roving life. Such a policy the West favors; but it is opposed to allowing twenty square miles of fine land to each buck, squaw, and papoose in the tribe.

Yours truly, P. Koch.

Bozeman, Montana, Jan. 18, 1879.

Notes.

HARPER & BROS. will shortly issue 'Bedouin Tribes of the Euphrates,' by Byron's granddaughter, Lady Anne Blunt.——J. B. Lippincott & Co. have in press a 'History of Princeton, N. J., and its Institutions,' in two volumes, by John Frelinghuysen Hageman.——Macmillan & Co. have become the publishers of Charles Kingsley's 'Health and Education' and 'Town Geology,' and of the 'Selections' from his writings. They also announce a uniform reduction of the price of the Clarendon Press Series of Shakspere's Select Plays to fifty cents.——Mr. James E. Munson, author and publisher of the 'Complete Phonographer' and the 'Dictionary of Practical Phonography,' has now issued, as the cap-sheaf of the series, a 'Phrase-Book of Practical Phonography,' which not only gives an alphabetical list (filling two hundred columns) of phrases, with the signs attached, but explains the reasonableness of them in an elaborate discussion of phraseography. The volume contains also exercises, with a key, definitions of law terms, etc., etc. Its usefulness cannot be doubted.——A 'Glossary of Biological, Anatomical, and Physiological Terms,' by Thomas Dunman, reprinted in this country by D. Appleton & Co., recommends itself as far as it goes (the botanical side of biology has been purposely neglected). The definitions are brief and clear, but the accentuation is either careless or eccentric.——The 'Technological Dictionary' in three languages, formerly published at Wiesbaden by C. W. Kreidel, is now being brought out in a third edition, improved and considerably enlarged, by J. F. Bergmann, of the same city, whose American agents are B. Westermann & Co., 524 Broadway. The first volume, German-English-French, is a large octavo of 744 pages, clearly printed and surprisingly accurate. Compound words are made separate articles, for greater ease of reference. For the first time nautical and meteorological terms have received adequate recognition and attention; and on this side particularly the general reader will find this work a useful reinforcement of the ordinary literary dictionary. Its long-established merit renders criticism unnecessary; but as the part is seldom better than the whole, it is worth remarking that the handy "pocket" abridgment of this Dictionary published in 1872 contains a large number of terms that have for some reason been dropped from the present edition, so that, while it cannot compete with its parent in freshness, it is not altogether superseded.——Part II. of Oncken's 'Allgemeine Geschichte' (B. Westermann & Co.) concludes the history of Ancient Persia, by Ferdinand Justi, agreeably written in a popular style, with deliberate suppression of reference to authorities, the author desiring his readers to find uninterrupted enjoyment in his pages. In his preface he satisfies them that he can be trusted with this license. The illustrations include a fac-simile of a page of the Avesta (Cod. K. V, fol. 40, Copenhagen), with transliteration and translation annexed; a marble tomb in Xanthos; the palace of Xerxes, with the lion and bull bas-relief enlarged; Persepolis, besides numerous smaller views, coins, etc., in the text. There are also two maps, expressly prepared under the author's supervision.——Mr. Wm. C. Gannett, of Minneapolis, Minn., has issued a convenient broadside chart, showing the "Growth of Hebrew Re-

ligion." It is creditably executed after Kuenen's 'Religion of Israel.' ——Alexander Duncker, Berlin, has begun the officially authorized publication of the Political Correspondence of Frederic the Great, drawn from the Prussian archives. This great work will fill thirty volumes, and will be annotated as well as chronologically ordered. Two volumes yearly will appear, and there will be two editions, 8vo and 4to. The first three volumes are to embrace the years 1740–45.——We commend to all who are interested in South American trade an article on the Commercial Routes (*Verkehrswege*—steamship service, railroad and telegraph lines) of Brazil in the double number, 76-77, of the Berlin Geographical Society's Journal (New York : L. W. Schmidt). It is purely statistical, and the information is not likely to be obtained elsewhere.——Koolman's Dictionary of the East-Frisian Dialect (Norden : Hermann Braams) reaches with Part 6 the letter G. The affinities of this dialect with our own language continue to be highly interesting ; see *fisk* (fish), *flappen* (flop and flap), *flint*, *flô* (flea), *flûrt* (flirt), *fögel* (fowl), *folk*, *försicht* (foresight), *fos* (fox), *fót* (foot), *fracht* (freight), *frê* (free), *frêsen* (freeze), *fründ* (friend), *fûst* (fist), etc.; and also the proverbial expressions—"hê is nêt fisk nog flêsk"; "so hard as 'n flint"; "he hed um 'n flô in 't ôr settd"; "ên fögel in de hand is bäter as twê up 't dak"; "försigt is bäter as nasigt"; "ên fründ in de nôd, ên fründ in de dôd"; "de de düfel to fründe hed, de kan ligd in de helle kamen." The ways in which the letter *g* is pronounced are amusingly various.——Mr. James A. McNeill Whistler's admirers are invited to subscribe to pure mezzotint engravings, by Richard Josey, under the painter's immediate supervision, of his portraits of his mother (an "arrangement in grey and black") and of Miss Rosa Corder (an "arrangement in brown and black"). Mr. Whistler, or Mr. Charles A. Howell, Chaldon House, Fulham, S. W., London, may be addressed. The proofs are, in each case, two and three guineas ; the prints, one.——We observe in the Spanish *Las Novedades*, published in this city, that Mr. Charles F. Bradford, of Boston, already a member of the Spanish Academy, has been honored by the King of Spain with the order of "Caballero de la Real Ordin de Isabel la Catolica." It will be remembered that Mr. Bradford was the author of a learned Index to Clemencin's Notes to 'Don Quixote.' He has also published occasionally verses of merit, both in English and Spanish.——In our notice of the Tanagra figurines a fortnight ago we omitted to give the exact address of Messrs. Feuardent & Co., who have them on exhibition. It is No. 30 Lafayette Place, where much else curious and precious is for sale.

—The libraries interested published in December, under the direction of Mr. Winsor, the first edition of "A List of Serial Publications now taken in the principal Libraries of Boston and Cambridge." It is a classified catalogue of 3,812 titles of newspapers, magazines, publications of learned societies, and other serials, excluding reports of public departments, boards, etc., is printed in a pamphlet of thirty pages the size of the Harvard College Bulletin, and is, we suppose, the first published instance of co-operative cataloguing. It is purposed hereafter to publish a list of the deficiencies of the different libraries under each title, or, perhaps, of the places where complete sets of the back numbers of each magazine, etc., may be had, in which case the one thing will be supplied now wanting to make the list of the highest value to investigators. We may say here that to the libraries containing "Paesi nouamente retrouati" and "Itinerariū Portugallēsiū," catalogued under Zorzi on p. 242 of the Harvard Bulletin No. 10, should be added the Public Library of Cincinnati. Another notable enterprise, which we announced some weeks ago, the *Index Medicus* of Drs. John S. Billings and Robert Fletcher, has appeared in a first number, dated January 31, 1879 (New York : F. Leypoldt). It really contains selections from the current medical literature of the past quarter, while the January periodicals, especially those from abroad, will be accounted for in the February number. The nomenclature and classification followed are substantially those adopted by the Royal College of Physicians, London, and the execution is beyond any praise of ours. The typography is clear, tasteful, and accurate. The mere list of periodicals indexed fills twenty-four columns.

—An article in the February number of the *North American Review* by Senator Hoar contains some excellent criticisms on the conduct of business in Congress. A curious question discussed is that of the privilege of the House of Representatives to originate all revenue bills, and what has come of it. In the Convention of 1787 the larger States endeavored to have the representation in both branches of Congress fixed according to population, but this arrangement was so strenuously opposed by the smaller States that a dissolution of the Convention was threatened. A compromise was finally arrived at by which the equal representation of all States in the Senate was conceded, but the power of originating bills of revenue was confined to the House of Representatives. Unfortunately, the power of amending these bills indefinitely was given to the Senate, so that, instead of being a privilege, the sole ability to originate money bills has turned out a limitation of the influence of the House. A measure of this sort coming from the House is treated with no more ceremony than if it had been brought forward by any member of the Senate. By the time it returns to the House, in practice a new bill, the session is usually so far advanced that it is impossible to consider the Senate amendments at length, and the bill goes through just as it is, or slightly amended by conference committees. Thus, although possessing the nominal privilege of originating money bills, the House has lost control over them, and has lost also the much more important prerogative—its freedom of debate. Were the Senate allowed to originate money bills, the House might share in amending them and so exercise its rightful power much more effectually than it can now.

—The House of Representatives has by various means deprived itself of that "freedom of deliberation, speech, and debate" which our early American constitutions declare to be "essential to the rights of the people." A member of a committee reporting a bill has the floor for an hour, and by demanding the "previous question" he has another hour to sum up, after which a vote must be taken. Thus all the time devoted to debate on the measure belongs to one person, who apportions it out to friends and foes, decides how long debate shall last, and if any amendment shall be offered. The House will rarely refuse the demand, for that would be tantamount to making the time for debate unlimited, which is very undesirable, on account of the great amount of business always before Congress. Another way in which the House abandons its freedom of debate and amendment, as well as all knowledge of its own actions, is by the motion to suspend the rules and pass. By this motion a measure known only by name may, without discussion or question, become the law of the land as far as the House of Representatives can make it so, and many important bills are, in fact, so passed at the end of a crowded session. A member of an appropriation committee reporting a bill always has precedence over any other committee, however urgent the business of the latter may be, and thus a bill the perfecting of which has occupied the attention of Congress for months is often lost altogether. The chairman of the Committee on Appropriations is unavoidably the enemy of all other measures to come before the House, because, money bills being indispensable to the conduct of the Government, they are considered immediately, while other questions are laid aside, and from the lateness of the session frequently precluded from further consideration. Mr. Hoar promises a future article which will deal with the question of remedy for these evils. Meanwhile he insists on the advantages of a Speaker independent of party, of a responsible leader for the House, and of a restoration of the House to the function of a deliberative assembly.

—If any proof were needed of the greatly improved standing of the stage in England of late, it might be found in the fact that a monthly magazine devoted to dramatic art has existed in London for now six months, and still shows signs of vigorous vitality. The stage in America never sank as low as it had got to be in England a dozen years ago. England had no tragic actor ; we had Mr. Forrest, Miss Cushman, and Mr. Booth ; and in comedy the influence of Mr. Wallack's Theatre here and of the Museum in Boston afforded a constant standard of comparison which was lacking in London in the days when the Haymarket was rapidly declining, and before the Prince of Wales's had become recognized as a home of higher dramatic art. But even among us the public taste in theatricals has greatly improved in the past five years, while in England the reaction has been still more violent. The interest in the stage which literature and society had lost was revived under the influence of the comedies at the Prince of Wales's Theatre with Mr. and Mrs. Bancroft, and of the tragedies at the Lyceum with Mr. Henry Irving. A new play at either theatre is now almost as much of an event in London society as a *première* of Dumas or Augier is in the Parisian world. And with the renewed feeling that the drama is an art and not a trade for sordid hucksters arose a demand for a journal of the higher dramatic art. The *Theatre* came into existence over a year ago as a weekly, and barely maintained itself. In August last it gave up its weekly issue and appeared as a monthly of nearly a hundred pages. The first number of the new magazine contained memoirs and photographic portraits of Mr. Henry Irving and of Miss Ellen Terry, and the general desire for pictures of these popular favorites rapidly exhausted the edition and assured the success of the new periodical. The first half-yearly volume is now

complete and the publication has at last got itself into shape. The monthly numbers contain a photograph of an actor and of an actress, with a memoir of each; a story and a poem or two on a theatrical subject; criticisms of new plays in England, France, Germany, Italy, and Spain; reviews of books bearing upon the stage (though this department is but meagrely kept up); paragraphs of theatrical news and gossip; editorial articles, grouped under the general heading "The Watch Tower"; and a collection of contributed articles by authors, actors, and critics, also grouped together and called the "Round Table." This last department is much the most important; it has embraced articles by Mr. Sothern, Miss Kate Field, Mr. H. J. Byron, Mr. J. L. Toole, Mr. Dutton Cook, Mr. Henry Irving; and for it Mr. Tom Taylor has written interesting accounts of his relations with two of the fine actors England has recently lost—Mr. Phelps and Mr. Wigan. Altogether, the magazine is creditable to the art it seeks to represent, shows a willingness and an ability to improve, and is likely to exert an influence for good. An index to new plays in English, French, German, Italian, and Spanish, with the full name of the author and of the theatre where each was originally produced, may be suggested as a possible addition of permanent utility.

—A correspondent writes to us from London under date of Jan. 28:

"I may mention as a sequel to the brief account of the suit Whistler *v.* Ruskin, which I sent you a short time since, that the plaintiff has lately published a little pamphlet in which he delivers himself on the subject of art-criticism. This little pamphlet, issued by Chatto & Windus, is an affair of seventeen very prettily-printed small pages; it is now in its sixth edition, it sells for a shilling, and is to be seen in most of the shop-windows. It is very characteristic of the painter, and highly entertaining; but I am not sure that it will have rendered appreciable service to the cause which he has at heart. The cause that Mr. Whistler has at heart is the absolute suppression and extinction of the art-critic and his function. According to Mr. Whistler the art-critic is an impertinence, a nuisance, a monstrosity—and usually, into the bargain, an arrant fool. Mr. Whistler writes in an off-hand, colloquial style, much besprinkled with French—a style which might be called familiar if one often encountered anything like it. He writes by no means as well as he paints; but his little diatribe against the critics is suggestive, apart from the force of anything that he specifically urges. The painter's irritated feeling is interesting, for it suggests the state of mind of many of his brothers of the brush in the presence of the bungling and incompetent disquisitions of certain members of the fraternity who sit in judgment upon their works. 'Let work be received in silence,' says Mr. Whistler, 'as it was in the days to which the penman still points as an era when art was at its apogee.' He is very scornful of the 'penman,' and it is on the general ground of his being a penman that he deprecates the existence of his late adversary, Mr. Ruskin. He does not attempt to make out a case in detail against the great commentator of pictures; it is enough for Mr. Whistler that he is a 'littérateur,' and that a littérateur should concern himself with his own business. The author also falls foul of Mr. Tom Taylor, who does the reports of the exhibitions in the *Times*, and who had the misfortune, fifteen years ago, to express himself rather unintelligently about Velasquez. 'The Observatory at Greenwich under the direction of an apothecary,' says Mr. Whistler, 'the College of Physicians with Tennyson as president, and we know what madness is about! But a school of art with an accomplished littérateur at its head disturbs no one, and is actually what the world receives as rational, while Ruskin writes for pupils and Colvin holds forth at Cambridge! Still, quite alone stands Ruskin, whose writing is art and whose art is unworthy his writing. To him and his example do we owe the outrage of proffered assistance from the unscientific—the meddling of the immodest—the intrusion of the garrulous. Art, that for ages has hewn its own history in marble and written its own comments on canvas, shall it suddenly stand still and stammer and wait for wisdom from the passer-by?—for guidance from the hand that holds neither brush nor chisel? Out upon the shallow conceit! What greater sarcasm can Mr. Ruskin pass upon himself than that he preaches to young men what he cannot perform? Why, unsatisfied with his conscious power, should he choose to become the type of incompetence by talking for forty years of what he has never done?' And Mr. Whistler winds up by pronouncing Mr. Ruskin, of whose writings he has perused, I suspect, an infinitesimally small number of pages, 'the Peter Parley of Painting.' This is very far, as I say, from exhausting the question; but it is easy to understand the state of mind of a London artist (to go no further) who skims through the critiques in the local journals. There is no scurrility in saying that these are for the most part almost incredibly weak and unskilled; to turn from one of them to a critical feuilleton in one of the Parisian journals is like passing from a primitive to a very high civilization. Even, however, if the reviews of pictures were very much better, the protest of the producer as against the critic would still have a considerable validity. Few people will deny that the development of criticism in our day has become inordinate, disproportionate, and that much of what is written under that exalted name is very idle and superficial. Mr. Whistler's complaint belongs to the general question, and I am afraid it will never obtain a serious hearing, on special and exceptional grounds. The whole artistic fraternity is in the same boat—the painters, the architects, the poets, the novelists, the dramatists, the actors, the musicians, the singers. They have a standing, and in many ways a very just, quarrel with criticism; but perhaps many of them would admit that, on the whole, so long as they appeal to a public laden with many cares and a great variety of interests, it gratifies as much as it displeases them. Art is one of the necessities of life; but even the critics themselves would probably not assert that criticism is anything more than an agreeable luxury—something like printed talk. If it be said that they claim too much in calling it 'agreeable' to the criticised, it may be added on their behalf that they probably mean agreeable in the long run."

—Interesting features in the fifteenth volume of *L'Art* (J. W. Bouton) are a glittering plate in aqua-fortis by J. A. Mitchell, an American engraver, which we may characterize in the words of the *Gazette des Beaux-Arts*—"the 'End of the Act' is a scene in a theatre, grasped like an artist and executed accordingly"; and the included article, by Tardieu, on American art which appeared in the weekly number for December 1. The significance of articles such as this, and as the similarly respectful criticisms of MM. de Lostalot and Lefort in the *Gazette*, is something like the delivery of the freedom of Paris in a gold box. French criticism, heretofore so tranquilly exclusive, has now genially committed itself, both in the case of English and American art. The supreme arbiter cannot well again affect the distant "eye-glass" and "curious" manner; our painting will be now admitted to be a rival, not a curiosity and an exception. Duranty's rather famous article in the *Gazette* about English art displayed, indeed, the lingering remains of the old genteel supercilliousness, the polite wonder at the white teeth and healthy skins of English portraits; but the notices of American painting are of a different tone—kindly, recognizant, and feeling. American art is given full welcome as a pupil that will soon be able to wrestle with the master and is even now able to hold its own among the rest. Indeed, it would be hard to find even a compatriot who would say that Bridgman, for example, is of "prodigious" ability, and that his professor, Gérôme, has nothing more to teach him, as M. Tardieu declares in *L'Art*; nor, much as we all admire Mr. Quartley for his qualities of atmosphere and transparency, would it be natural for a home critic to set him on a full par with Vollon, as *L'Art* does not hesitate to do. What seems most to surprise M. Tardieu is our artists' versatility in method, or—shall we say?—their hesitancy between different styles. He desires evidently to adjust the American pictures at the Exposition to a consistent and logical line, constitutes Mr. Homer a laureate and portraitist of Uncle Toms, and is ready to believe that it is not the same hand which paints Eaton's "Harvesters" and Eaton's "Reverie." Very naturally, our critic goes most eagerly to those contributions in which he can detect a really national quality and accent. After lavishly praising Mr. Quartley's river scene—"a capital impressionist's effect, remarkable for accuracy of eye and exquisite in charm"—and giving Mr. Tiffany's "Duane Street" credit for nimbleness of execution, he observes, "Here are two more artists frankly American." The qualities of Mr. Homer, equally self-made ones, he finds to be "a method that is sincere, not exempt from a sort of clumsiness, but honest, serious, and strongly imprinted with local character; and directness in his drawing, frankness in his color, and sincerity in reading his types." M. Lefort, by the by, in the *Gazette*, credits Mr. Homer with "originality and independence, both in choosing or arranging subjects and in the choice and feeling of his color and design." Mr. Wylie, who never had a French master unless it was Barye, and who simply took his own American academy in his arms and planted it on Breton soil, is given due prominence as the commander and best of the modern "bretonnistes," though an error is made in accrediting him to the school of Couture, from whom he took no lessons.

—The notice of *L'Art* is scarcely less indulgent even when applied to those Americans who are least American. Mr. Shirlaw, recipient of an honorable mention only, "deserved something more"; the critic manifests a fascinated interest in Mr. Vedder, even while calling him bizarre; terms Mr. Dana's marine sinister and grandiose; Mr. La Farge's meadow bravely and candidly painted; Mr. Brown's urchins not good as a painting, but diverting as an illustration—avoiding here the singular coupling of Brown's style with Homer's into which Cherbuliez was betrayed last August in the *Revue des Deux Mondes*. Among the gentle hits given by M. Tardieu, though still encased in velvet, are the remarks that the painter of "Cerise" must have paid Manet a visit, and that Mr. Bunce's gondola strictly follows Ziem's. Altogether, however, the criticism is distinguished by a curious frank recognition of the appearance of certain new powers and directions in art, and a sort of formal introduction of our nationality into the world of painters. We should like to mend out, did space allow it, the notice in *L'Art* (still incomplete, though particularizing twenty-six painters) with notices in other French periodicals strictly in harmony with its own urbanity; thus, M. Lefort, in the *Gazette des Beaux-Arts*, distinguished half a dozen omitted from *L'Art's*

long list (Wyant, Richards, Gay, Sanford Gifford, Miller, and Bacon), while his appreciation of the "exquisite refinement and transparency" of Quartley and the "rightness and perfect impression" of Tiffany are equal in cordiality to anything *L'Art* has to offer; and M. de Lostalot, in the same journal, discovers a new candidate for favor in Mr. Abbey, whose "Stage-office" presents a "harmony in grey not without charm for all its austerity." But the recognition of so indefatigable a studio-frequenter as M. Tardieu is quite enough to show that Paris experts have recognized among their trans-Atlantic visitors certain originals, as well as certain "fidèles," who are to be watched henceforward. For the rest of the present volume, our recognition of the merits of its predecessors makes it unnecessary to say much. It contains some of the most interesting etchings ever published in a periodical, such as the "Mrs. Bischoffsheim," after J. E. Millais, three grand Rubenses, and Velasquez's "Spinners" and Moro's "Bloody Mary," the last two illustrating an interesting series on the pictures at Madrid. The editor's concluding notice is large in promise, and no doubt will be liberally carried out. Some final articles on the Exposition are intended; M. Tardieu, in a notice of the British school, is to heal the wounds made by the unsympathizing Duranty; Sidney Colvin is to resume his study of old engravers; and some decorative work is to be entrusted to an English designer, John Watkins, who already appears in a marginal ornament for a number issued since the binding up of this volume.

—Nicola Zanichelli, Bologna, has published 'La Vita e le Opere di Giulio Cesare Croce,' a learned and very entertaining monograph by Olindo Guerrini, of which we hope to give some account hereafter. In his preface the author, speaking of the *disonesta povertà* of the Italian libraries, says that in his country the only persons who can study are the rich, and they, ninety-nine times out of the hundred, have no desire to:

"Former governments did not love knowledge; the present one lacks the means to make it not only complete but available. From the beginning of the century till this very day the Italian libraries, with one or two exceptions, have not purchased modern books—formerly because they were not disposed to do so, now because they cannot. It is strange, for example, that in a student centre like Bologna, whence latterly have issued not doubtful proofs of laborious learning, the library has but four or five hundred dollars to spend, which do not suffice even for the continuation of the most necessary periodicals. In every branch of knowledge the freshest works are wanting, and they cannot be procured, although the rules direct the librarian to inform himself and keep complete the publications in all the sciences. When posterity sees the petty result of the magnificent things which the rules ordered in our libraries, I hardly know what they will think. Perhaps they may go so far as to suspect the honesty of the librarian, not dreaming that if he had appropriated to his own uses the whole endowment of his institution, he would not have had the means to live decently."

—The topographical survey undertaken in Attica by the Imperial German Archæological Institute four years ago included Athens and the surrounding territory, or a parallelogram bounded by lat. 37° 54′-38° 12′ N. and long. 23° 36′-23° 52′ E. This area was subdivided equally into six, the Peiræus and Hymettus sections lying south of the 38th parallel, and containing Athens and its port. All former surveys were disregarded, and Herr J. A. Kaupert, of the Prussian General Staff, was detailed by Count Moltke to establish a wholly new system of triangulation and levelling. He especially took upon himself the survey of the city itself, and in regard to the archæology co-operated in 1877 with Prof. Ernst Curtius, who had been sent out by the Royal Academy of Sciences. The first fruits of their labors have now been published in an elegant small folio Atlas (Berlin: Dietrich Reimer; New York: L. W. Schmidt), consisting of three maps and nine plates, and intended as the basis of a 'Hand-book of the Topography and Antiquities of Athens' now in preparation. While the scale of the series of sectional maps is to be 1:25,000 (about 2½ inches to the mile), the maps of Athens here given, and those of the Peiræus which have been prepared under the direction of Lieutenant Georg von Alten and will next be published, are on twice the scale. No. 1 shows the Athens of to-day; No. 2, ancient Athens superimposed on modern Athens, the latter being printed in a pale but perfectly clear tint; No. 3, the southwestern portion of the city, ancient and modern, from the eastern foot of the Acropolis to the Peiræus railroad. The last, being on a scale of 1:4,000, permit indications of architectural and sepulchral remains of every description. All the maps are executed with the greatest beauty and delicacy. They are followed by tinted drawings after photographs (from which extraneous details have been omitted) of the burial way before the Dipylon; the Pnyx, the Museum Hill, the Areopagus, the Hill of the Nymphs, the pool and caves of Callirrhoë, the Hippodrome, the Theatre of Bacchus; rock tombs, grottoes, fragments of sculpture, etc., etc.—views, elevations, sections, and plans. The letter-press is by Curtius and Kaupert. Altogether the work is one which should find a place in every institute of the higher instruction and in every public library.

POLITICAL FORESIGHT.*

SENIOR'S conversations are a satire on human wisdom. The most remarkable men of France—Guizot, Thiers, Mérimée, the late and the present Duc de Broglie, Chevalier, Montalembert, and a host of others—confided to him their opinions, their views of the world, their fears and their hopes for their country and for Europe. His pages, which reproduce with equal impartiality the sentiments of Monarchists, Republicans, Socialists, and Legitimists, afford a record of the sayings and speculations of French society during the ten years which followed the *Coup d'état*. The men who found it their interest to make a confidant of the English gentleman whose one remarkable gift was his insatiable curiosity to know what any celebrated person thought about anything, were almost all of them men far above the ordinary level. Many of them were versed in affairs. Some of them had played a leading part in European history. All of them were keenly interested in modern politics. From such persons one might reasonably expect to learn lessons of political wisdom or to receive remarkable forecasts of the future of Europe. As a matter of fact, the one impression which a careful perusal of Senior's book leaves on the mind is, that the most cultivated and most intelligent men of his time neither understood the age in which they lived nor were able to foresee what was about to happen within even a few years. The single fulfilled prediction which the book contains is the remark of Chevalier, that when the Suez Canal was completed England would make an effort to obtain Crete or Cyprus; and we may doubt whether this prophecy can be put down as more than a lucky hit.

If statesmen, however, may show wide foresight without being able to predict a single specific event, and if men like Thiers, Guizot, or Montalembert had shown themselves masters of the general course of European politics, there would be little reason to blame them for want of sagacity because they did not predict isolated occurrences. But the really curious thing is, these celebrated persons show themselves at every turn deficient in that grasp of the situation which popular imagination attributes to a statesman. The whole of French society spent their time in the dreary years between 1850 and 1860 in speculating on the durability of Louis Napoleon's power. Every act he did, his daily life, his associates, his policy and his want of policy, were the subject of hourly criticism. It is no exaggeration to say that at least a third of Mr. Senior's last two volumes is taken up with remarks upon Louis Napoleon. These criticisms lose a good deal of their point and form in passing through the hands of a reporter utterly incapable of understanding a witticism; but their substance is no doubt faithfully enough recorded, and a reader, however hostile he may be to the French Emperor, cannot fail to see that the criticisms of French Liberals are marked by a singular futility. This is the more striking because intelligent Frenchmen living at Paris soon saw through the pretence that the Emperor was a man of genius. His weaknesses, his hesitation, his administrative incompetence, which were hidden from the rest of Europe till 1870, were the common talk of Paris before 1860. Yet, in spite of the advantage possessed by critics who saw the Emperor without his mask, the pointed censures which they aimed at the object of their hatred have in them very little which is instructive. The problem to be solved by any one who wished to predict the course of imperial policy was in reality, What was the source of the Emperor's success? And the plain truth is that perfectly legitimate hatred and partially legitimate contempt for Louis Napoleon blinded the whole of French Liberal society to the fact that the Empire, hateful though it was, rested on foundations of permanent strength. No one of Mr. Senior's friends even suspected how widespread was the support which the imperial system received. We now know that the fiasco in Mexico, diplomatic failure in 1866, even the defeats of 1870, did not at once cost the Emperor his throne. He might, it would appear, had he not been taken prisoner at Sedan, have retained, even after the most crushing blows, the allegiance of the army, and possibly the submission, if not the support, of the peasantry. It is evident, on the other hand, that the wits and statesmen of Paris believed that the master whom they hated and despised would fall from power at the first shock of adverse fortune. Their mistake in this respect is connected with another curious error. French Liberals perceived and exaggerated the evils of universal suffrage. They

* 'Conversations with M. Thiers, M. Guizot, and Other Distinguished Persons during the Second Empire. By the late Nassau William Senior.' London: Hurst & Blackett. 1878.

did not perceive that the institution which they hated was the one article in the Constitution to which ordinary Frenchmen attached importance. This is not the occasion to examine the merits or demerits of a system which gives a vote to every man throughout the country; but we venture to assert that the importance attached by a French elector to universal suffrage can at any rate be vindicated under the present condition of France by very cogent arguments, and that there is something singular in the blindness of statesmen who could not feel that the greatest respect was due to the single political arrangement which commands the assent of the vast majority of the people, and has now remained unchanged for more than a generation.

The strong antipathy of good to bad may be urged as an excuse for the false estimate formed by French Liberals of the strength of the Empire. But this justification or excuse will not palliate their strange want of insight into the course of foreign affairs. In nothing is this more remarkable than in their attitude towards Italy. The war for Italian independence was, as a French Liberal expresses it, "the Emperor's war," and, being the Emperor's war, it was in the eyes of educated Frenchmen wholly and entirely hateful and indefensible. That Frenchmen should object to the loss of French blood and treasure in a cause which did not directly concern the interests of France, was reasonable enough. But Mr. Senior's friends went far beyond such legitimate objections. They totally disbelieved that Italian unity was possible. If it were possible, they did not think it desirable. At the outbreak of the war they believed Austria to be in the right, and, what is more singular, they clearly failed to see that Italy, and, to a certain extent, the Emperor as a friend of Italy, commanded the sympathies of Europe. Even the patriotism of Thiers, which, if narrow, was as sincere as it was intense, almost yielded to his hatred of Italian independence :

"Ten years ago," he said in 1859, "if any one had prophesied that a time would come when I should look with any feelings but those of the bitterest grief at the reverse undergone by France, how angrily I should have resented such an imputation ; and yet the time *has* come."

For a man who felt in this way it was, of course, impossible to measure the sentiments of the French nation towards the Italian war. The fairest estimate of their feelings which Mr. Senior records proceeds from the mouth of an Imperialist :

"The war," says Mérimée, "is unpopular in the salons, as everything else done by the Emperor is. . . . It is unpopular, too, with the priests and with those whose sons are affected by the conscription, but the bulk of the people approve it and even like it. The last three weeks have produced an enormous change in public opinion—that is, in the public opinion of the 'bourgeosie' and the 'peuple de Paris.' I have been absent for a fortnight. When I left Paris they dreaded the war ; on my return, a week ago, I found them reconciled to it—partly from the tendency of the French to accept and make the best of what is unavoidable, and partly from their belief that Austria is the aggressor."

These sentences contain the clue to half the errors of French statesmen. Mr. Senior's acquaintance had with all their merits the grave defect that they had breathed the air of the salons of Paris so long as to forget that the atmosphere of the salons was not necessarily the atmosphere of France. Men not really at home in the sentiments of their own country are not likely to appreciate the feelings of foreign nations. Yet, though we may be prepared for mistakes, there is something astounding in the perverse blindness of French politicians to the most obvious facts of English politics. Thiers, who after all must have known a good deal about England, laments that the English Government did not interpose to prevent the outbreak of the war between Austria and France. The ministry, that is to say, ought in his opinion to have forbidden the liberation of Italy. Montalembert cannot understand that England should sympathize with "Garibaldi's piracy," and believes that enthusiasm for Italy is the result of "mere Protestant bigotry, as blind and as stupid as that of the Puritans two hundred years ago, but without their sincerity and their undaunted courage," and obviously thinks, in common with Thiers, Guizot, and men far wiser and abler than Montalembert, that the natural policy for an English Government was to support the Pope, to keep the King of Naples on his throne, to maintain Austrian rule in Lombardy, and generally to keep Italy weak in order that France might be strong. There is something in Montalembert's position which has a peculiar absurdity of its own. He raves at England for not sufficiently detesting the Emperor, though he himself rallied to the hero of the *Coup d'état*. He is, in his own opinion, the devotee of liberty, yet deplores Italian independence, and, while making his religious views the standard of his secular policy, marvels that English Protestantism should not follow the course which commends itself to Ultramontane fanaticism.

Still, even callousness to the feelings of foreign nations is compatible with keen insight into the dangers which menace one's own country from abroad, and it might be expected that politicians whose whole attention was devoted to the errors of the French Government would see from afar off the rising of the storm which burst upon France in 1870. To a certain very limited extent men like Thiers may be said to have foreseen that the consolidation of strong states on the borders of France might menace the independence of their country, but none of the persons who conversed with Mr. Senior seem to have entertained in 1860 the very remotest suspicion that Prussian power might be a danger to France. The very few notices of Germany in Mr. Senior's book are now extremely curious. There are two or three references to French intrigues in the Prussian-Rhenish provinces, and the tone of the speakers obviously implies that the efforts to found a party in favor of annexation to France were likely to be successful. The question is more than once raised whether England will interpose to keep France from seizing the Rhine. That Germany can more than protect herself seems in 1860 to have been a notion which had never entered the mind of any Frenchman.

"France is a standing danger, sometimes to the freedom, sometimes to the good government of Europe. And what bulwark have you now against her ? Not Prussia. Her army, out of all proportion to her population or her wealth, is a militia. Our military men treat it with contempt. Sardinia, or by whatever name the new kingdom of Italy is to be called, is, at least for the present, powerful only for mischief. The Netherlands and Belgium could bring into the field two hundred thousand men, a force not to be despised, but they have no military reputation. Russia is *hors de combat*. Our troops have returned from Italy with a great respect for the Austrian soldiers, but they have enough to do to keep down Hungary and Venetia. Austria, while intact, supported by Belgium and Holland, and in case of need by Prussia, was a check to the ambition of a French despot or to the madness of a French republic, which was useful and, I might say, indispensable to you and to ourselves, and you have done and are doing all that you can without actual war to break her up."

These are the words of Guizot in 1860. As we read them we almost despair of human foresight. The forecasts of a learned historian and experienced statesman turn out, when put to the test, worth just a little less than the prophecy of the gypsy who foretold to Queen Hortense the fortune of her child. "She prophesied," said Mr. Senior's informant, "that he would rise to the highest eminence of power and fame, and would be killed by a bullet entering his forehead." The fortune-teller, it is true, erred as to the mode of Louis Napoleon's death. Her error is pardonable. She doubtless foresaw Sedan, and did not believe that even a Bonaparte could have left the field alive.

Six Months in Ascension. An Unscientific Account of a Scientific Expedition. By Mrs. Gill. (London: John Murray. 1878.)—In this pleasant little volume we have a very readable account of one of those expeditions to distant parts so frequently undertaken by astronomers for the purpose of scientific observations. Mr. David Gill is a Scotch astronomer, who has gained a high reputation within the last few years by his observations and investigations as well as by some ingenious inventions. As a scientific partner and assistant of Lord Lindsay he accompanied the latter to the Mauritius, in 1874, to observe the transit of Venus. He there became convinced that observations of the transit could not lead to entirely certain results, and wrote some articles on the necessity of finding a better method. The remarkably favorable opposition of Mars, in 1877, during which the planet approached nearer the earth than it had before done in our time, afforded him an opportunity to put in practice a plan of observations by which he believed a single observer could derive a more exact value of the solar parallax than it was possible to obtain from the transit of Venus. The result was an expedition upon which hardly any one but an enthusiast would have thought of embarking. It was necessary to find some accessible point not far from the equator where fine weather and a fine atmosphere would be tolerably sure to be found during the two months which were favorable for the observations. The point finally chosen was Ascension, a nearly barren island, only a few miles in extent, lying in the South Atlantic Ocean, west of Africa, and occupied by the British Government as a naval coaling station. The instrument which Mr. Gill took with him to make the necessary measurements on Mars was one excellently adapted to the purpose, a heliometer loaned by Lord Lindsay. The observations were entirely successful, and after their completion the astronomer returned home to compute the result, a work on which he is now engaged.

Mr. Gill was accompanied by his wife, an arrangement which has resulted in our having embodied in the book before us a much more detailed history of the expedition than would otherwise have been

possible. The work cannot claim attention on the ground of great novelty of scene or of striking adventure. The experience was little more than that of every voyager to equatorial regions at the present day, and the story has been told a great many times. Happily for the book-maker the reading world never wholly tires of hearing the tale of travel, and many readers who have circumnavigated the globe in their libraries may gain, through Mrs. Gill's nimble pen, some new glimpses of life at those numberless little military posts with which Great Britain has girdled the globe. A certain scientific flavor is given to the book by an introduction from the hand of the astronomer, in which is found one of the most complete and accurate histories of previous attempts to measure the sun's distance which has yet appeared in an English dress. This is the feature which will most commend the book to the scientific reader. He will notice with interest the curious mutations in the opinions of the astronomers of the present day respecting the true distance of the sun. First we had Encke's estimate of ninety-five millions and upwards. Then, about twenty years ago, this was proved wrong, and the distance suddenly jumped down to ninety-one millions. Much speculation was rife respecting the extraordinary error of the old determination, but few were found to dispute the new one. But new determinations have been going upward ever since, and Professor Airy's determination from the recent transit of Venus is ninety-three millions, an estimate as near to the old rejected value as to the one which first took its place.

English Plays, selected, edited, and arranged by Henry Morley, Professor of English Literature at University College. With illustrations. (London and New York: Cassell, Petter & Galpin. 1879.)—This, the third volume of 'Cassell's Library of English Literature,' is, like its predecessors, wholly independent of the other issues of the series. Professor Morley has before now, in the 'Memoirs of Bartholomew Fair,' and in the 'Journal of a London Playgoer,' shown his liking for the stage and his qualifications as a critic of the acted drama. He has not here attempted that full history of the rise and fall of the ample dramatic literature of our language which we hope some day to see written with a due sense of its importance. To use his own words (p. 271, note), "The book is not a history, but a series of specimens, with no more narrative than is necessary to explain coherently when and by whom each piece was written." It is rather, it seems to us, a series of analyses of typical and characteristic plays, with abundant extracts, arranged in chronological order, and accompanied by brief biographies of the dramatists as they succeed each other on the stage of life. It is more than a series of specimens, especially in that it is philosophically planned, and is historical in its method; it is much more than a mere catalogue. It does, in fact, for the whole long line of English dramatic literature what Charles Lamb did for the Shaksperian period in his 'Specimens of English Dramatic Poets.' Lamb gave but little more than extracts with his own fine criticism. Professor Morley, as we have said, sets his specimens in a narrative of the plot of the play from which they are taken. His criticism is not as acute or as searching as Lamb's; but it is unpretending, direct, and, in the main, admirable. His style is simple and sufficient, his knowledge of his subject is evidently first-hand, and he writes with real liking for the drama. No better general view of English dramatic literature from its rude origin to its final wasting away—if, indeed, it has wasted away—no better introduction to the study of it, can be recommended than this volume of Professor Morley's.

The first play analyzed is one from the Wakefield Mysteries; the last is the "School for Scandal." While the supremacy of Shakspere is well brought out, the space devoted to him is wisely restricted, to the benefit of other and less familiar dramatists; Marlowe's "Doctor Faustus," for instance, has allotted to it twelve double-columned pages. The account of the English drama of this century is somewhat too slight and meagre; surely the poetic plays of the first quarter of the century which have survived until the last quarter deserve mention—"Damon and Pythias," the "Honeymoon," and John Howard Payne's "Brutus." Recognition might also have been accorded to some of the few true comedies of more recent date, such as "Masks and Faces," by Messrs. Charles Reade and Tom Taylor, and "Caste," by the late Mr. Robertson, and "Sweethearts," by Mr. W. S. Gilbert. In a minor point or two Professor Morley errs: (p. 429) Sheridan altered "Pizarro" from Kotzebue; he did not himself translate it, being ignorant of German. It might be fairly inferred from the paragraph (p. 424) including among the younger Colman's successful works "The Iron Chest," "a drama in which John Kemble played," that this actor had performed in the play with success. The fact is that the piece was damned when Kemble acted in it, and was only accepted afterward when the author brought it out at his own theatre with Elliston as *Sir Edward Mortimer*.

The book is well made, containing nearly four hundred and fifty double-columned quarto pages, with an ample index to plays and dramatists and another to the notes. It is embellished with nearly eighty woodcuts, fairly engraved, of which the subjects have been chosen with unusual aptness, and are, with a few exceptions, really illustrations to the text. They include portraits, views of theatres and of scenes, sketches of costumes, etc. Those accompanying Elkanah Settle's "Empress of Morocco," taken from the original edition, are most appropriate and interesting.

Coal; its History and Uses. By Professors Green, Miall, Thorpe, Rücker, and Marshall. Edited by Professor Thorpe. (London and New York: Macmillan & Co. 363 pp. 1878.)—This book consists of ten popular lectures on five important subjects connected with coal. They were given by the authors in the order named on the title-page, two lectures on each of the following topics: Geology of Coal; Plants and Animals of the Coal-Measures; The Chemistry of Coal; Coal as a Source of Warmth and Power; The Coal Question. Although not uniformly cast in a mould adapted to the comprehension of a popular audience, these lectures present in a sufficiently popular manner the different phases of a subject which, from every point of view, is most intimately interwoven with modern life. In the first four lectures the reader has spread before him the history of coal, beginning with the elements of stratigraphical geology, the special conditions of land, water, and vegetation that render possible the formation of coal in general, the special description of the coal-measures of the United Kingdom, and a description of the plants and animals of that period. The two lectures on the Chemistry of Coal treat of the nature of the changes from plant to coal; the differences between coals; of inflammable gas and safety-lamps, and of the principal products of coal, viz.: gas, oil, colors, and paraffine. The physics of the subject are treated in a very clear manner under "Coal as a Source of Warmth and Power."

The reader is led up to an appreciation of the intimate relation of this fuel to modern wealth and comfort, and to the realization of the enormous extent to which the wealth and power of Great Britain are conditioned by cheap coal; and in view of this, the last two chapters on the Coal Question would have an interest apart from the additional value they possess as a remarkably able and dispassionate discussion of the subject. The coal produced in the United Kingdom in 1876 contained the energy equal to more than 3,000,000,000 of adult laborers. This product—133½ million tons—when compared with the carefully estimated net available coal at a less depth than 4,000 feet, viz., 145,500 million tons, does not seem very significant till we realize that the production is increasing in a geometrical ratio at a rate that doubles the annual output every twenty years. This rate of increase would make the yearly product in 1936 equal to 1,003½ million tons, and would have exhausted the choicest and most accessible quarter of the available coal. If continued, it would exhaust the coal-fields in 125 years. But this rate could not go on till exhaustion, because, as Professor Marshall shows, long before that time the increased cost of extraction would do away with the cheapness which conditions the demand. The introduction of greater economies in the cost of production and diminution of waste will be at once discounted by an extension of consumption; and legal restrictions regarding waste, export duty, etc., would inevitably raise the cost. The conclusion arrived at is, that England's industrial wealth and power are built up on and maintained by cheap coal; and that this can be enjoyed only on the condition that this fuel be raised and used up as fast and as freely as possible; that as soon as it shall become necessary to save, it will not matter how large the store of unmined coal may be, the sceptre of manufacturing power will depart to more favored lands. The chief hope is that the change may be sufficiently gradual to admit of an adaptation to the new order of things. The author does not look upon the subversion of the manufacturing industry as synonymous with social or even material ruin.

The book is well illustrated and almost wholly written in an attractive style.

Sport and Work on the Nepaul Frontier; or, Twelve Years' Sporting Reminiscences of an Indigo Planter. By "Maori." (London and New York: Macmillan & Co. 1878.)—Nepaul, bounded on the north by the great range of the Himalayas, extends southward as far as the province

of Behar, a country rich in varied forms of vegetation and remarkable for the intelligence of its native inhabitants and the beauty of its forests and scenery. Plains yellow with grain and groves of plantain and bamboo extend to the south and east as far as the sacred Ganges, interspersed with the fragile villages of the natives and dotted at long intervals by the tall chimney of some indigo factory. Along its northern frontier are vast tracts of jungle, the home of the tiger, the boar, and the Indian buffalo, while in the rivers the alligator shows his black snout on the surface as he awaits the unsuspecting approach of an evening meal. In the midst of this country and among its black and uncivilized inhabitants the indigo planters have established themselves, and, living so far apart that only rare meetings are possible, they rule the villages under the control of their factories with an almost patriarchal sway. Their land is usually rented from the native owners, the working classes going with it and becoming the dependents of the factory. The Englishmen who control the planting and manufacture of indigo have little society except that of their native dependents. The national characteristics and customs are in no way lost by this isolation, however. Once a year, while the new plants are growing and the vats are dry, the English residents gather together at the Planters' Club on their horses or elephants, and, accompanied by their suites of dusky retainers, spend several days in the enjoyment of each other's society. The natives assemble in crowds to see the British sport of horse-racing and take their first lessons in the occult science of betting, while in the evening, among Indian jungles and almost within hearing of the tiger's roar, the company dance to the familiar strains of the "Blue Danube."

Except for these few days of relaxation the life of a foreigner is dull and hard. The natives try to cheat him in a hundred ways, and a ceaseless watchfulness is imperative. When an opportunity occurs hunts are organized on a great scale, tiger-hunting with elephants being the favorite sport. Our author's descriptions of these scenes are vivid and minute, but the stay-at-home reader must take them on trust. We were much interested in the fate of the greedy tiger who was choked while trying to swallow a bullock's knee like a pill, and still more in the fastidious alligator in whose stomach were found the bracelets of a dozen Indian maidens who had formed the *petits morceaux* of his varied *menu*. Many interesting facts are given concerning the habits of wild animals, and the mooted question of a tiger's maximum length receives much attention, but there is too much of "pig-sticking," and the slaughter of animals generally, for readers who are not moved by actual participation in the excitement of the hunt. The book is published in a very handsome form.

Russlands Geschichte und Politik, dargestellt in der Geschichte des russischen hohen Adels. Von Dr. Arthur Kleinschmidt, Docenten der Geschichte an der Universität zu Heidelberg. (Cassel. New York: L. W. Schmidt. 8vo, pp. xvi. and 560.)—Exhaustive books on Russia, on her history, social life, and economical conditions, are multiplying; and Dr. Kleinschmidt's work is one of the best among those known to us, not excepting D. Mackenzie Wallace's, which is probably the best in the English language. The latter contains an excellent chapter on the Russian "Noblesse," in which the peculiar features of the titled class of the Empire (for a real aristocracy does not exist there) are clearly drawn, in contradistinction to the nobilities of western Europe—of Germany France, or England. Dr. Kleinschmidt's introduction to his exceedingly rich collection of biographies of Russian nobles confirms and completes Wallace's statements by fuller historical touches, though he naturally leaves large gaps in the general picture, to be filled up by deductions from the individual sketches following.

The history of the Russian nobility—considering the whole of the history, even Wallace would not object to this term—begins with the year 1015, when the Grand Prince Vladimir, of the house of Rurik, at his death divided his realm between eleven sons and a nephew. Divisions followed divisions, and conflicts were numerous in proportion. Early in the thirteenth century the Mongols subjugated the country, but, instead of fostering splits and dissensions among the vanquished, they introduced a unity of power among them by making the Grand Prince of Moscow a supreme vassal. The Muscovite princes eventually felt strong enough to cope with their protectors, and Ivan III. (1462–1505) shook off their yoke. The smaller princes became his subjects, and were soon robbed of their appanages. The boyars, or great landed proprietors, of Muscovy were by him and his successors placed on a level with the formerly sovereign, princely descendants of Rurik. Ivan IV., the Terrible (1533–1584), bent on making his own favor the sole source of distinction, "madly worked the rope, the rack, and the axe against the nobles, and cut off their heads like poppy-heads." He completed the genealogical book of his grandfather, and made noble rank and precedence depend not upon degrees of descent from Rurik, Gedimin of Lithuania, or other high ancestors, but upon service at the court or in the army. The family which counted most officials of high rank thus became the most distinguished. This order of rank, the *Miestnitchestvo*, led to endless disputes, for which the weapons were drawn from jealously-watched records of service. These disputes were often ludicrous, and sometimes, as when the respective rank of commanders in a campaign was in question, grave and disastrous. During the civil wars caused by the Pseudo-Dimitris, after the extinction of the Rurik dynasty, the nobility, long degraded, showed itself mostly unpatriotic and selfish. When the house of Romanoff was in 1613 raised to the throne, chosen on account of its insignificance, an attempt was made to restore the influence of the nobles in the government, as it had existed in early times. Ukases were issued in the name of the czar, who "commanded," and of the boyars, who "determined." The latter became, however, only "privileged slaves in a land of universal slavery." They evaded the public service, spent their time in gluttony and profligacy, and quarrelled about precedence. Fedor III., disgusted with this state of affairs, burned the official records of service, had the golden book of nobility republished, and decreed the perfect equality of all titled families. His successor, Peter the Great, the most uncompromising of autocrats, in his eagerness to transform Russia, put the nobility under his iron heel, treating it to the lash and the knout, often with his own hand. To add humiliation to degradation, he made princes his buffoons. He ennobled foreigners, and even a Jew, Shafiroff; made the son of a peasant, Menshikoff, a prince; and introduced the new titles of count and baron. Nobility was henceforward to offer no advantages of promotion in the service, but service to lead to nobility, temporary and hereditary. The nobles were bound to serve, and by undergoing a degrading punishment lost their rank for ever. After the death of Peter the Great (1725) and his widow, Catharine I. (1727), the boyars regained influence under Peter II., and on his death (1730) offered the throne to Anna of Courland on specified conditions. On ascending it she tore the written compact, and then took bloody revenge on those who dared to limit her prerogative. Apraxin, a Prince Volkonski, a Prince Golitzyn, were among her buffoons. No change took place under Elizabeth. Peter III. exempted the nobility from corporal punishment. Catharine II. flattered, distinguished, and employed it in various ways, but preserved her absolute sway intact. Alexander I. and Nicholas acted like her in the main. Alexander II., by emancipating the serfs, struck the last blow at the prerogatives of the nobles, and plunged hundreds of titled families into comparative or absolute poverty, thus punishing them for their long grinding of the peasants, but leaving noble and peasant in equally abject submission to the behests of autocracy.

After thus sketching, in brief outlines, the course of the general history of the Russian nobility, a course so utterly unlike the changes of the feudal organizations in the Romanic and Germanic states of Europe, the author proceeds to give connected accounts of all the prominent noble families of the Empire of the czars, writing the life of every historical member. His main divisions refer respectively to "Extinct families" (of the houses of Rurik and Gedimin), "Still flourishing families descended from Rurik or Gedimin," "Old boyar houses not descended from Rurik," "Russian princely houses of foreign descent," "Russian count families of foreign descent," "Families raised to princely dignity from the ranks of the common nobility," "Families raised to the dignity of counts from the ranks of the common nobility," and "*Parvenus*." Some of the families are represented by single or few members; others, such as the Dolgorukis and Muravieffs, by an uncommon variety of characters, ranging from brutal executioners to sentimental revolutionists. The vicissitudes of some families and individuals are amazing. The sketches are crammed with events and dates, to a degree which renders the book much more valuable for reference—lists rendering reference easy—than enjoyable as reading matter, especially to those little familiar with Russian history and Russian names of men and places. Warriors, courtiers, and diplomatists whose influence has been important in shaping the grand destinies of the Empire, such as Pozharski, Suvoroff, Diebitsch, Paskevitch, Potemkin, the Orloffs, Golitzyns, Vorontzoffs, and Gortchakoffs, are presented in full portraits. The Princess Lieven is the most interesting of the female characters, besides the empresses regnant, who constantly appear in the background, with power and passions equally unchecked. The author narrates court events and draws personal traits with the frankness and impartiality of a man entirely remote

from the scene, and bent on giving unvarnished facts from which the reader may draw his conclusions. He has derived his information from ample materials, and his accuracy is striking.

Sketches of Animal Life and Habits. Pp. 208. *Leisure-Time Studies,* chiefly Biological. Pp. 381. (New York : R. Worthington. 1878.)—In two attractive volumes Dr. Andrew Wilson has brought together sketches, essays, and lectures written or delivered at intervals during a long life as a teacher of natural history. The 'Sketches' treat pleasantly of animalcules, deep-sea creatures, sea-anemones and sea-urchins, crabs, insects, and fishes, concluding with a brief account of some "foot-prints on the sands of time" more literal than were in the poet's mind. The reader misses the evidence of individual observation of the animals themselves, but the sketches are imbued with the spirit of a true lover of nature who perhaps has seen more than his modesty allows him to express. Indeed, the author lays no claim to originality, but aims to "afford to general readers, and especially the young, some popular and yet trustworthy ideas regarding some of the most interesting groups of the animal world." We wish we could say that all the statements "possess the merit of correctness," as they certainly should in a volume for the young ; but in the chapter upon "Some Odd Fishes" occur the following, which are, to say the least, misleading : The mucus or slime of fishes is twice spoken of as "*oily* matter." The author implies that with all living sturgeons the scale armor is only partial, whereas the "shovel-nose" of our Western rivers is completely mailed. Socketed teeth are denied to all fishes, and the "hag" is said to have but a single large tooth. Amphioxus is credited with a "hyoid *bone*," there being really no bone in its whole body. The outline of the hippocampus's head is said to resemble "exactly" that of a horse. The correspondence of the bony framework of the fins with that of the higher vertebrate limb is regarded as clear, whereas the precise homology is far from being ascertained. Most of the illustrations are both handsome and accurate, but that of the lamprey shows no sign of the seven spiracles on the side of the neck by which it is most readily distinguished.

The 'Leisure-Time Studies' are mostly discussions of important biological questions, although three of them, "Some Animal Architects," "A Summer's Day," and "What I Saw in an Ant's Nest," would have found more appropriate places in the smaller volume just noticed. The essay last named seems to be the only indication of our author's desire and ability to do what his writings purport to encourage in others, namely, "original observation of the habits of animals." But Dr. Wilson certainly thinks for himself, and his treatment of "The Genesis of Life," "The Law of Likeness," and "The Origin of Nerves" tends to induce a thoughtful consideration of topics which have a bearing outside the province of the professed naturalist. In "Biology in Education" occurs the following passage :

"That boys or girls should leave school ignorant of the grand facts of biology, unable to give any intelligent account of the constitution of the world in which they live, and unlearned in the phenomena of their own existence, is a fact in the present history of education for which the future will have good cause to blush."

Literary Essays. By William G. T. Shedd, D.D., Roosevelt Professor of Systematic Theology in Union Theological Seminary. (New York : Charles Scribner's Sons. 1878.)—The essays contained in this volume embrace a wide variety of subjects. One is on "The True Nature of the Beautiful, and its relation to Culture"; another, on the "Confessions of Augustine"; a third, on "The Influence and Method of English Studies." In all there are eleven, on subjects connected more or less closely with æsthetics or literature. Dr. Shedd is a fluent and versatile writer, but his manner of dealing with the subjects he writes of differs widely from that most in vogue nowadays with ordinary lay critics. With the empirical, artistic view of culture which judges all products of the mind by non-moral standards he has no sympathy. Like all theologians, he has a great belief in system, and he brings his system with him into whatever branch of human thought he enters. As he declares in his preface :

"Right or wrong, the opinions themselves spring out of one intuition. The fine art and the philology are kindred to each other ; the philosophy and the rhetoric are homogeneous in their spirit and tendency."

He adds that, so far as his own convictions are concerned, he "finds some reason for confidence in the general correctness of his views in the fact that they are thus interlocked with each other from the first, and that the growth of his own mind has only interlaced them more and more." The opening essay on the Beautiful was, it seems, composed in 1851, "and all of the writer's study of books and observation of man from that time to the present has only made him tenfold more certain that the theory of æsthetics then presented is the true one." It would be impossible in any small compass to give an adequate idea of the variety of opinions and ideas advanced by Dr. Shedd in this volume. The opinions are not always novel, but the arguments by which they are supported frequently are. Thus, the essay on the Beautiful is designed to show that "neither music, nor painting, nor sculpture, nor architecture, nor poetry can properly be made the main instrument of human development"; that what we need is mainly "the culture that comes from science and religion"; that what ought to be done is "to bring the Beautiful under the problem of the True and the Good." A great deal of this essay is interesting and valuable. Occasionally, in his zeal, Dr. Shedd advances an argument which strikes us as more novel than sound, as, for instance, when he urges the following, drawn from Roman history :

"Which," asks Dr. Shedd, "is the venerable period in her history ? Is it to be sought for in the luxurious and (so far as Rome ever had it) the æsthetic civilization of the empire, or in the intellectual and moral civilization of the monarchy and republic ? All the strength and grandeur of the Roman character and of the Roman nationality lies back of the third Punic war. Nay, if Rome had been conquered by Carthage, and had gone out of political existence, its real glory, its proper historic renown, would have been greater than it is."

So again, in the essay on "The African Nature," he makes the suggestion that what is needed to counteract the severity of the Puritan type is a new development in Africa, and he draws a sketch of this new sort of "coming man": "A mild, docile, musing, and recipient nature, which is to drink in all the influences that shall pour forth from the old and perhaps then declining civilizations of the other zones" ; the "*artist's* nature, open at every pore, sensitive in every globule and cell of tissue, pulsing with a warm and somewhat slumbrous life—a deep base for a high structure." It is proper to say that this suggestion dates from a period when African colonization excited more hopes than it does now. The essays on "Rhetoric" and "English Literature" will be found among the most valuable in the volume.

Short History of German Literature. By James K. Hosmer, Professor of English and German Literature, Washington University, St. Louis ; Author of "The Color Guard," "The Thinking Bayonet," etc. (St. Louis : G. I. Jones & Co. 1879. 8vo, pp. 591.)—"The effort of this book is to give the main configuration of the literary landscape ; to show it in its proper perspective—the great peaks illuminated, the less important summits in a shadow that deepens as they grow lower" (p. 476). By adhering to this maxim, Prof. Hosmer has succeeded in writing a very readable and valuable book, the best book for the general reader, on a subject extremely wearisome if treated in detail. Of mediocre authors German literature is full, and the memories of students and the general public should not be burdened with their names or characteristics ; these can be safely relegated to works not intended for continuous reading—to encyclopædias, dictionaries, and indexes. How high the line of shadow is drawn in this work may be judged when we find that no mention at all is made of Bürger, Chamisso, Hauff, Voss, or Zschokke, and that Freytag is mentioned, and nothing more, and then only as a dramatist. The author's picture of German literature would have lost almost nothing in clearness and unity if these figures and a few more had been inserted, and there would have been room enough gained and to spare by omitting some thirty-five pages on the Thirty Years' War, with a minute and interesting account of the Battle of Lützen, and incidental descriptions of the uniforms worn by Tilly, Wallenstein, and Gustavus Adolphus, together with the author's emotions on visiting the spot where the latter fell :

"I thought of the stain that had lain on the lichens there ; the cold mist charged heavily with the sulphurous reek of the combat. . . . At the inn my mind was too full for quiet sleep ; if my eyes closed, 'twas to dream of smoking torches in the hands of men covered with dust and blood, and shining on the king's body ; of the clatter of hammers driving coffin-nails, and of Wallenstein, red and spectral like the wild huntsman, swallowed up in the gloom and storm of the spectral night."

This passage is a very mild sample of a style which is too frequently pitched in a higher key than the subject warrants, and of the author's unfortunate fondness for taking us with him to towns and streets and professor's houses which he himself, at any rate, visited with pleasure. We are reminded now and then of General Scott's celebrated despatch beginning, "After a hasty plate of soup." Both these faults are easily accounted for, if not so easily condoned, in a work no doubt made up

from lectures delivered to the author's classes in the West, and both, as well as sins of omission and defects of proportion, may be corrected, it is to be hoped, in a revised edition.

About a third of the whole history—too large a fraction—is taken up with German literature before Luther. Here the student should have been told what Old High-German and Middle High-German are, and that it is not enough to know modern German in order to read them. Then comes a thoroughly interesting chapter upon Luther, with numerous brief translations. To the misplaced account of the Thirty Years' War succeed the headings, Lessing (53 pp.), Klopstock, Wieland, and Herder (29 pp.), Goethe (84 pp.), Schiller (59 pp.), the Romantic School (28 pp.), Heine (41 pp. !), and the Modern Era (22 pp.), the last being little more than the author's personal impressions of Hermann Grimm, Von Ranke, the historian Mommsen, the chemist Mommsen, the physicist Kirchhoff, the Emperor William, and a German gymnasium. An excellent chapter on German style and its obscurity closes the volume. The author's own style is clear and animated, and his statements are definite. It is hardly fair to the layman to use any German words whatever without translating them into English—and Mr. Hosmer does forget to translate in a few cases—or to tell the student that "Germans" means "Shouters in battle," and that Friederike Brion was the prototype of Gretchen in 'Faust,' without informing him at the same time that opinions are divided on these points. The definition of epic poetry, as this term is used by the Germans, is not orthodox. We notice the following misprints and slips of the pen: *Vorsehen* for *Versehen* (p. 537), Leipsig everywhere for Leipsic, Perseus for Persius (p. 569), and *laut* (loud) translated as if it were *lauter* (clear) (p. 574). "Taxed as cattle," p. 433 (of the Hessians sent to fight in our Revolution), seems to be a translation of *taxirt*, etc., which rightly means "reckoned as cattle."

BOOKS OF THE WEEK.

Authors.—Titles.	*Publishers.—Prices.*
Baily (W. E.), Modern Rhymes	(J. B. Lippincott & Co.) $1 00
Belrose (L., jr.), Thorns and Flowers	(Philadelphia)
Boardman (Rev. G. D.), Studies in the Model Prayer	(D. Appleton & Co.) 1 25
Boyesen (Prof. H. H.), Goethe and Schiller	(Chas. Scribner's Sons) 2 00

WESLEYAN FEMALE COLLEGE.—Best advantages in Literature, Science, Languages, Painting, Wood-Carving, and Music.
Rev. DAVID H. MOORE, D.D., President.

PENNSYLVANIA, Germantown, West Chelten Avenue, below Wayne Street.
MISS MARY E. STEVENS'S, formerly Miss Mary E. Aertsen and Miss Mary E. Stevens's, School for Young Ladies, will reopen Sept. 19, 1878. Scholars prepared for the Harvard Examinations for Women.

PENNSYLVANIA, Haverford College P. O.
HAVERFORD COLLEGE, under the care of the Society of Friends (Orthodox). THOS. CHASE, LL.D., President. For catalogues apply to Prof. ALLEN C. THOMAS, Pretect.

PENNSYLVANIA, Swarthmore, Del. Co. (10 m. from Phila.)
*SWARTHMORE COLLEGE, a Friends' In-*stitution, for the thorough collegiate education of boys and girls, young men and women. No distinction is made in studies pursued or degrees conferred.
For Catalogue containing full particulars apply to the President,
EDWARD H. MAGILL.

WISCONSIN, Racine (on the Lake Shore).
RACINE COLLEGE begins September 5. The College and Grammar School open the same day. For catalogues apply to the Rev. JAMES DE KOVEN, D.D.

Wants.

A GRADUATE who has studied two years at German universities would accept a position in a college for the next collegiate year to teach German and English to advanced classes. Particulars and references on application. Address TEACHER, office *Nation.*

A HARVARD mathematician will assist by letter. A. S. C., 20 Third Street, N. E., Washington, D.C.

A YOUNG MAN of good qualifications and literary tastes (college graduate '76) desires a position as private secretary. Satisfactory references. Address SPERO, Box 464, New York City.

*WANTED—A fluent writer and expert mana-*ger to conduct the Insurance Department of a well-established New York journal. Address, stating present engagement, JOURNAL, P. O. Box 3200, New York City.

Heliotype.

Permanent Photographic Book Illustrations.

THE HELIOTYPE PRINTING COMPANY are producers of Book Illustrations by the Heliotype, Photo-lithographic, and Photo-engraving processes. Employed by the United States Government in illustrating Scientific and Medical Reports, by Scientific, Historical, and other learned Societies, by the leading publishers, and for illustrating Town and Family Histories, etc., etc.

Facsimiles of Medals and Coins, Ancient MSS., Paintings, Drawings and Sketches, Views and Portraits from Nature, Medical and Scientific objects, Antiquities, etc., etc.

For terms and specimens apply to the

HELIOTYPE PRINTING COMPANY,

220 Devonshire Street, Boston, Mass.

The Emerson Steel Portrait.

"The portrait [by Rowse, in crayon; considered the best portrait of Emerson in his prime] is a remarkable likeness, and happily renders the sweetness and serenity of expression which are characteristic of Mr. Emerson. Mr. Schoff's engraving reproduces all the essential qualities of expression and treatment in the original with surprising fidelity. It is a sympathetic, and not a merely mechanical, piece of work; and it evinces a power of drawing, and a feeling for subtle qualities of form and light and shade, which are most rare among modern engravers. The quality of the well-defined yet softly-melting edge in the contours of the face seems really wonderful, and the sureness and economy of line and touch by which the total result is reached entitle the work to rank among very uncommon achievements."—*The Nation, January 2, 1879.*

"I think the work one of very remarkable excellence. I have seen no recent piece of portraiture so good, and I believe the engraving will hold place among the best-engraved portraits."—*Professor Charles E. Norton.*

Proof-impressions of the Engraving (price $10) may be obtained direct from the engraver, Mr. S. A. SCHOFF, Newtonville, Mass., or may be ordered through any dealer in prints in the United States.

BANGS & CO., Auctioneers, 656 Broadway, New York. MONDAY and TUESDAY, Feb. 17 and 18: Standard, Illustrated, and Rare, Costly and Valuable, BOOKS, many of them in fine bindings—Astle's Origin and Progress of Writing, 4to, half-morocco, 1876; Augustine, Of the Citie of God, folio, 1610; Baird, Brewer, and Ridgway, North American Birds, 3 vols.; Barnard's Drawing from Nature, royal 8vo, 1877; Barrett's Magus, 4to, half-morocco; Beaumont and Fletcher, 2 vols. royal 8vo, calf; Beauties of England and Wales, 25 vols. 8vo, calf; Braght, Het Bloedig Toonel, folio, 1685; Burns's Works, 2 vols. 4to, half-morocco, 1867; Calvin's Commentaric on Genesis, 4to, 1578; Casanova, Memoirs de, 6 vols., 1876; Catlin's Indian Portfolio, folio, half-turkey; Dance of Death, copperplates, by M. Merian, 4to, 1724; De Ghuy, Etchings, folio, half-vellum; Dickens's Works, 30 vols. 12mo, calf, Lond.; Dramatists of the Reformation, 12 vols. 8vo, L. P.; D'Urfey's Pills to Purge Melancholy, 6 vols., L. FOR SALE—The first fifteen volumes of The Nation. ISAAC SHARPLESS, Haverford College P. O., Pa.

My Annual Catalogue

Of VEGETABLE AND FLOWER SEED FOR 1879, rich in engravings, from original photographs, will be sent FREE to all who apply. Customers of last season need not write for it. I offer one of the largest collections of vegetable seed ever sent out by any seed house in America, a large portion of which were grown on my six seed farms. Printed directions for cultivation on each package. All seed warranted to be both fresh and true to name; so far that, should it prove otherwise, I will refill the order gratis. The original introducer of the Hubbard Squash, Phinney's Melon, Marblehead Cabbages, Mexican Corn, and scores of other vegetables, I invite the patronage of all who are anxious to have their seed directly from the grower, fresh, true, and of the very best strain. NEW VEGETABLES A SPECIALTY.

JAMES J. H. GREGORY,

A NEW CIGARETTE,

Gotten up in honor of the Paris Award. Each Cigarette bears cut of the Paris Medal and brand, Parisian style. Our Tobacco and Cigarettes are better than ever, and unsurpassed for Purity, Delicacy, and Excellence. Special size Cigarettes, with any NAME, MONOGRAM, CREST, or DESIGN, to order, at $5 for 500. Samples on receipt of postage stamp. Samples of our Asthmatic and Catarrh Cigarettes, each, 25 cents by mail.

WM. S. KIMBALL & CO., Rochester, N. Y.
Peerless Tobacco Works.

The Nation.

NEW YORK, THURSDAY, FEBRUARY 20, 1879.

The Week.

FROM Thursday to Saturday the Senate had its turn with the Chinese question, and passed the House bill at last by a vote of 39 to 27, with some amendments of slight importance. By it neither foreign vessels nor native-owned will be allowed to bring to this country from any quarter more than fifteen Chinamen on a single voyage, and these passengers must regularly appear in the manifest as part of the cargo. Violation of these provisions is punishable with a fine of one hundred dollars and imprisonment up to six months for each Chinaman in excess of the prescribed number, and the amount of the penalties becomes a lien upon the vessel. Exception is made in favor of Government officials or attachés of the Chinese Embassy, and of temporary sojourners having an educational end in view; and masters whose vessels are driven into port by stress of weather will not be held liable. The two Republican Senators from California, Messrs. Sargent and Booth, the Democratic Mr. Grover of Oregon, Senator Jones of Nevada, indeed the Senators from the Rocky Mountains to the Pacific, were *ex officio*, as we may say, ardent supporters of the measure. They had as natural coadjutors their Southern colleagues, like Senators Morgan and Eustis, and this fact alone, in the eyes of a tolerably logical public, would have indicated Mr. Blaine's place to be on the opposite side. Other considerations prompted him to an ostentatious adhesion to the sand-lot view of the question. Mr. Hamlin and Mr. Matthews spoke ably and at length in opposition to the bill, on humanitarian grounds and on behalf of international courtesy and good faith. Mr. Conkling tried to reduce the measure to a simple giving of notice to abrogate the treaty if not modified by mutual consent before Jan. 1, 1880. Mr. Edmunds in disgust offered the following satirical amendment, which was rejected by the same vote that passed the bill:

"That the United States hereby recognizes a reciprocal right and power in the Government of China to regulate, so far as its own dominions are concerned, intercourse between the two countries according to its own sense of propriety, notwithstanding existing treaties with the United States; and the President is hereby requested to communicate a copy of this act to the Chinese Government."

Otherwise the Senate has been chiefly occupied with the bill to amend the Internal Revenue laws, another House measure, in which the main interest centred upon the tax on tobacco. That interest, which is charged with having bought Pacific-Coast support in return for anti-Chinese votes, succeeded at all events in putting back the tax to the low and uniform rate of sixteen cents a pound adopted by the House, in spite of the Finance Committee's recommendation to impose twenty-four cents on snuff. Mr. Bayard led the party of reduction, alleging the greater return of revenue in consequence. The House suspended the rules on Monday and summarily passed in succession the River and Harbor Appropriation Bill, the Deficiency Bill, and a bill which appropriates $26,852,000 towards meeting the arrears of pensions, and puts an economical interpretation on the bill creating these arrears. Mr. Sherman will need more than this amount to prevent a deficit, and Mr. Fernando Wood has proposed to his Ways and Means Committee to take the necessary twelve or thirteen millions out of the Treasury balance, arguing that the Treasury is amply provided against resumption and may as well use its idle margin in this way.

Secretary Sherman writes to the Chairman of the Committee on Appropriations that the amount payable by way of arrears of pensions, under the Act of January 25, will, it is estimated, reach $41,500,000, and that the result will be a deficit in the revenue for the coming fiscal year amounting to $27,000,000 nearly. To provide this he recommends the imposition of some new tax adequate for the purpose, or the issue of four per cent. bonds. It is to be hoped that the latter expedient may be adopted. The passage of the Pensions Bill was a piece of demagogy of which a great many members of Congress saw the mischief. They hoped the President would veto the bill, which would undoubtedly have finished it. Its evil consequences, however, may not end with the expenditure of $41,500,000. It is to be feared that the necessity of meeting the deficit may again open the floodgates of financial folly.

Mr. Fernando Wood has done some service in illustrating the dangers of having the Treasury act as a bank of issue and keep great quantities of greenbacks afloat. One of the necessities of such a bank is the maintenance of a large coin reserve for the purposes of redemption; but this reserve will always be open to attack at the hands of two classes—those who think it too large, and those who do not want redemption at all; that is, persons with peculiar views about banking, and greenbackers pure and simple. The former, whenever there is a deficit in the revenue, will always say, as Mr. Wood does, Why not meet it with some of your coin, instead of putting more taxes on a sorely-tried people? You can have no possible use for more than half your present accumulation. The latter, on the other hand, will be constantly trying by making extraordinary appropriations like the Pensions Bill to create a deficit, and will then resist any mode of meeting it but an issue of fresh paper or the dissipation of the coin reserve, so as in the one way or the other to put a stop to redemption altogether. We may add that Secretary Sherman is indirectly fostering this spirit of mischief by confounding the greenbacks on hand with the coin assets of the Treasury, in his monthly reports, when they are in reality liabilities or due debts, and ought to be constantly and carefully treated as such.

There is a fierce contest going on before the Senate over the bill introduced by Senator Jones, of Florida, permitting the railroads to open their telegraph lines to general business. The main argument in its favor is that it would break down the monopoly of the Western Union, which is urged strongly by the railroads and the newspapers who do not belong to the Associated Press, while the Western Union maintains that it would be dangerous to give the same corporations control both of transportation and correspondence, and that the bill would throw open to State telegraph companies privileges on the railroads for which the Western Union has been compelled to pay; and that, anyhow, Congress has no right to legislate in the matter.

The President's letter to Mr. Merritt, the Collector, of which we spoke last week, has been published *in extenso*, and in the matter of civil-service reform is almost as good as the letter of acceptance in 1876. He instructs the Collector to manage the Custom-house on strictly business principles, and tells him he wants him to "be perfectly independent of mere influence from any quarter," and that "neither his (the President's) recommendation, nor that of Secretary Sherman, nor of any member of Congress or other influential person, is to be specially regarded." He also directs him to put in force once more the rules recommended by the Civil-Service Commission. It would seem as if the best way of preventing the recommendations of the President or of Secretary Sherman from having any influence would be the steady refusal of these gentlemen to give any recommendations. In this way the burden of the Collector would be lightened and a good example set to members of Congress. It would be very hard for Mr. Merritt not to heed letters coming from his superiors, and he ought not to be called on for any such

displays of virtue. In civil-service reform, as in many other good things, each officer, from the President down, must do his own share of the work. A temperance apostle who took an occasional dram himself, and warned his neophytes not to mind him when he invited them to "take a drink," would meet with but limited success.

One good result of the passage of the New York Custom-house into the control of the Administration has already been produced. Mr. Conkling has begun to show some interest in general legislation, and actually took part in the debate on the Chinese bill, and moved an amendment to it which would have greatly improved it. This is the more creditable because the destruction of the Arthur-Cornell question must have left a great void in his intellectual life. *That* he had thoroughly mastered. He was familiar with all the literature of it, ancient and modern. If an Arthur-Cornell Chair had been founded at a university he would have been the only man competent to fill it. That he should so soon, under the circumstances, apply his mind to new subjects shows great recuperative power. That the Custom-house will always be an object of tender interest to him, as the once happy home of many needy and devoted followers, is very likely, but nobody but a brute would find fault with this.

The physical condition of Mr. Samuel J. Tilden becomes every day more mysterious. The New York *Times* is the highest living authority on his history and his bodily and mental characteristics, and we quoted last week its account of his state when before the Potter Committee. From this it appeared that he was suffering severely from "palsy"; his hands were "transparent," and shook violently during his examination; his countenance was "expressionless," and was "seamed all over with physical decay," and he showed in his evidence that all his faculties were gone except his memory, with the aid of which he was enabled to "mumble" a large number of falsehoods, from which we conclude that his speech was also affected. The case, as thus described, has begun to excite a good deal of interest, with both the lay and professional public, on account of the extraordinary survival of the memory after the loss of the other faculties. The mystery has, however, become deeper since we last wrote, for he seems either to have rallied in a most singular way or to be able to carry on his wickedness with a curiously small supply of vitality. The *Times* of Monday called attention editorially to the fact that he was not only still intriguing for the Presidential nomination, but was taking an active part in the approaching municipal election in Philadelphia, where he was working to secure the election of one McMullin, a "notorious Squire" and a henchman of Samuel J. Randall, who, in return for Tilden's aid, is to send Tilden delegates to the National Convention. The *Times* added that it is "well known that Tilden has agents all through the State of Pennsylvania whose business it is to talk him up as an injured man." We think under these circumstances it is not too much to ask him to have himself reported on by a committee of experts in the interest of science.

Dunn, one of the members of the South Carolina Returning Board, has been examined by the Potter Committee, and he is the only witness since Mr. Tilden whose evidence is at all interesting. He testifies that he received proposals from one Hardy Solomon to buy the vote of South Carolina for Tilden. He says he gave Solomon at the very first interview a decided refusal to have anything to do with such a wicked scheme, but nevertheless continued to see him every day for several days, and to talk the matter over with him, in order to find out what "the plans of the Democracy" were, and what he heard he regularly communicated to Governor Chamberlain as "danger signals," just as Marble communicated the corrupt proposals he received to Pelton. The Committee are now trying to secure the attendance of Solomon, but that person is, it appears, keeping out of the way and will not be found till Congress adjourns. If so, he is more sensitive and timid than anybody else who was down there seeing to a "fair count," and must, we should judge, for this reason be rather an interesting man. Dunn also made on Tuesday the amusing addition to his testimony that Solomon was confederated with him in "playing it on the Democrats," Solomon intending "to get the money out of the Democrats if he possibly could." Dunn is a friend of Kimpton and Chamberlain, and now lives with the former in Boston.

A movement has been set on foot by Bishop Huntington, of Central New York, in conjunction with a considerable number of clergymen of various denominations, for the purpose of breaking up the Oneida Community, whose principal seat is at Oneida, in Madison County, N. Y. A meeting, to which leading ministers from all parts of the State were invited, was held at the Syracuse University on Friday last, with Bishop Huntington in the chair; but if the brief report of the New York *Times* be correct, the proceedings were not very effective. Professor Mears, who was called on for a description of the Community, was obliged to admit that the members "were good citizens, orderly and cleanly in the manner in which they conduct their home." We believe he might have added they were excellent and successful business men, and much esteemed as such by all who have dealings with them. The charge against them is that in the Community "men and women live in a state of concupiscence," and that there is an "impure emanation" from it, but all acknowledged that there was no outward cause of scandal. The lawyers present were called on for a remedy, and one of them suggested the insertion in the New York statute against "disorderly persons" the words—"all persons living in concupiscence or adultery." This is not very luminous for a lawyer. What is "living in concupiscence"? "Concupiscence" is a state of mind, and you cannot indict a man or woman for evil desires. Moreover, to prove adultery you must prove marriage, and the Oneida Community have no marriage. In fact, the subject is a most difficult one to deal with by legal penalties, and we think the clergy would do well not to attack it with the arm of flesh, lest they give the Communists the glory of martyrdom. Would "concupiscence" be discredited by the spectacle of men going to jail rather than surrender their peculiar views about it? The Oneida theory of the relations of the sexes is odious, no doubt, but it is the product of crackbrained biblical exegesis and is sincerely held, and the sheriff can hardly kill it.

A robbery occurred on Friday afternoon in broad daylight, in the most crowded part of Fifth Avenue, which shows with what moderation thieves on the whole behave. A well-dressed man seized one of two ladies who were walking together, put one arm firmly round her neck, and then tore out one of her diamond earrings, besides tugging sharply at the other. Having secured it he ran off, pursued by a few young men; but having a good start, he reached his coupé, which was waiting for him at a little distance, and was driven rapidly to his residence. The ladies were put into a carriage in a fainting condition, and one of the papers gives that touch of *bouffe* to the affair which is seldom wanting in criminal cases in New York, by saying that when a policeman arrived on the scene he was with difficulty prevented from arresting them and clubbing the bystanders. If the occurrence checks the silly habit of wearing expensive ornaments in the streets it will not be wholly regrettable. This habit has reached such a point that among the poorer women one often sees in the horse-cars a big gold chain and locket hanging round the neck outside a waterproof cloak. There is little doubt that half these things might be carried off by young robbers in good condition who had horses and wagons waiting for them within a reasonable distance.

Enough United States 4 per cent. bonds were sold during the week to enable the Treasury to notify the holders of $40,000,000 more of 5-20s of 1867 (6 per cents.) that they will be redeemed ninety days hence. This makes a total of $230,000,000 of the public debt on which the annual interest has been reduced one-third since the resumption of specie payments at the beginning of last month.

The continued redemption of 5.20s is bringing back from Europe an amount of these bonds which is sufficient, in addition to other demands, to keep the market for sterling exchange very strong, so strong that gold coin exports are expected in the early future. At the Stock Exchange the infamous proposal to use the coin reserve in the Treasury, held there for the redemption of legal-tender notes, to pay pension claims, was construed by stock speculators as an inflation movement, and it had the effect of rekindling the fires of speculation which, at the close of January and early in February, had begun to wane. The most notable event of the week, both as respects stock speculation and railroad management, was the sale, privately, of 100,000 shares (of the par value of $10,000,000) of Union Pacific stock, the seller having been Jay Gould and the buyer a syndicate of Wall Street and San Francisco operators who manage railroads and speculate in stocks. Whether the transfer of ownership will improve the management remains to be seen. That it improved the speculative position of the stock in the market is shown by an immediate advance of 14 per cent. in the price of it. The money market was fitful during the week, the common rates for call loans having been 2 to 3 per cent., but rates were run up on several occasions for a short time to 5 to 7 per cent. Ten or twelve of the leading banks agreed not to discount below 4 per cent.; the union lasted only a few days, as it was found impossible to keep the rate up.

The Marquis of Lorne has opened the Canadian Parliament with a speech in the nature of a message, which, however, differs from a message in being simply an exposition of the ministerial policy, and in large part a recital of matters already well known. He hints that the deficiencies in the revenue are to be made up by a readjustment of the tariff, with the view of increasing the revenue and at the same time developing and encouraging the various industries of Canada. In other words, he announces a policy of "incidental protection." The Princess Louise the same day held her first drawing-room in a way which dissipated the growing anxiety about exclusiveness and dress. The ladies appear to have worn high-necked dresses if they pleased, and nobody was shut out who was thought worthy of presentation to any previous vice-reine. But a line has to be drawn somewhere, and the task of drawing it in Canada must be a fearful strain on chamberlains. We are glad to notice that "Major Dom, M.P., wore a cavalry uniform which he had imported from England at a cost of $700."

The English Ministry have made no formal announcement of their programme for the session since the opening of Parliament, but it is understood that they will devote themselves to home affairs, so as to make some amends for the too vigorous foreign policy of last year. They have, however, succeeded in defeating the Liberals and Home-Rulers united in an attempt to extend to Ireland the low borough franchise established in England by the last Reform Bill. There is news from South Africa that things are no worse since the late disaster, and that some minor attacks of the Zulus have been repulsed. Reinforcements are being poured in from India and England which will probably double Lord Chelmsford's force, which is now 10,000 Europeans besides the native auxiliaries, who, contrary to the first reports, do appear to have behaved well. But the pluck of the Zulus in charging resolutely under the fire of breech-loaders is a serious fact, which makes a long and expensive war likely, and it is a war to which the colony itself can contribute but little in money or men. The peremptory order in Council forbidding the importation of American cattle on account of the appearance of pleuro-pneumonia among the beasts at Liverpool is exciting a good deal of feeling. The farmers, who have been very gloomy of late, are much pleased, but the meat-eaters are alarmed, as the trade has been growing rapidly, and has had a marked effect on prices.

The Bishop of Gloucester's explanation of his vote on the Afghan war has naturally excited a great deal of reprobation in England, and having been called to account for it by the Peace Society he has again rushed into print and made the matter worse. He says: "Regarding England as having become the trustee of India and of Indian interests, spiritual and material, I believe the war to be a just war, undertaken under motives of distinct ethical validity." This argument would, of course, justify any war which, in the eyes of those declaring it, might, if successful, improve the spiritual condition of the enemy. It would suit the Pope admirably. Self-constituted spiritual trustees are, in fact, as Voltaire said of Habakkuk, "capables de tout," and when they openly declare it to be their duty to execute the trust by force, they justify almost any form of resistance. The bishop's observations, however, are not only easily refuted, but they have furnished in England a good deal of material for unseemly jokes. People are not unnaturally amused by the notion of General Sam Browne and General Roberts being "spiritual trustees," and knocking Afghans on the head in order to save the souls of the Hindoos.

The light sentence on the directors of the Glasgow Bank—imprisonment from six to eighteen months—has called forth much surprise and some indignation. But it has been overlooked by many that the Crown lawyers withdrew the charges of theft and embezzlement in the course of the trial, and went to the jury on the charge of falsification of accounts simply. There was no proof that this was done by the directors for their personal advantage. They simply tried in a weak and criminal way to put off the exposure of the huge deficit created by reckless advances on worthless securities. Two of them, who are old men, will probably be killed by the sentence, lenient as it is.

In Germany the public mind is concentrated on the question whether Bismarck can succeed with his Parliamentary Discipline Bill, while the chances against his success seem to be increasing, owing to the union on this question of the National Liberals and Progressists, the National Liberals apparently regaining some of their old courage. The state of opinion in the Parliament on the bill is likely to be tested by the result of the pending debate on the demand of the Government for permission to prosecute two deputies accused of Socialism. Should this permission be refused, the defeat of the bill is considered certain. The spirit of resistance to the Chancellor is encouraged by the action of the courts in acquitting the editors of the Frankfort *Gazette* for publishing a spirited reply to the charge made in his place in the Chamber that the journal was in the pay or under the influence of France.

The plague shows a decided decrease in violence, probably owing more to improvement in the weather than to any of the remedies so far attempted. General Melikoff found the prisons in the infected districts overcrowded and filthy to a shocking degree, and has ordered a thorough renovation of them by the authorities on pain of death. He also ordered the formation of a military cordon extending the whole length of the Volga. Physicians have been despatched by France, Germany, and Austria to study the disease, and England intends to do the same. Italy seems to be more alarmed than any other nation; her line of steamers to Egypt has been discontinued, and a merchant vessel was warned off at Palermo by a cannon shot. The quarantine regulations in all dangerous places have been made very stringent, and letters from Russia are fumigated at the frontier. It is pointed out by Surgeon-General Woodworth, in a letter to the Congressional Committee on Epidemics, that should the plague appear in European countries with which the United States have direct communication, there will be serious danger of the disease reaching our shores. The board of yellow-fever experts unanimously recommended that United States medical officers should be stationed at Liverpool and at some point in the Mediterranean, in order to give prompt and reliable information to the authorities at our seaports. They should also be subject to orders to report on foreign epidemics.

THE CHINESE DEBATE.

HOW much the Republican party will put up with from some of its leaders in the way of insincerity it is, of course, impossible as yet to say, but the debate and passage of the Chinese Immigration Bill must, we cannot help thinking, have brought the more honest and intelligent members of the party considerably nearer the last limits of their patience. The bill, no matter what one's opinion of its object may be, is absolutely indefensible. It constitutes the sudden breach, with every circumstance of discourtesy, of a treaty solemnly contracted with a great and friendly Power, on our own motion. We propose to break it without notice, without discussion, without taking the trouble to find out whether the other party to the contract would or could remedy what we complain of in its operation. We have not yet asked whether the Chinese Government would consent to a revision of the whole instrument, although a joint resolution directing the President to do so was passed last summer, and we do not offer to relinquish any of the privileges which we ourselves have acquired under it, and now enjoy. We simply pick out of it a single provision which annoys us, and announce that we shall no longer be bound by it, and all this in language of the deadliest insult to the whole Chinese race. If the task of putting a stop to Chinese immigration had been entrusted to a committee of drunken miners or "sand-lot" agitators, they could hardly have executed their task with greater disregard to the decencies of international intercourse. The effect of the whole proceeding, too, is heightened by the fact that it is in form the protest of a very refined, very moral, very religious, and very civilized people against corrupting intercourse with ignorant and vicious barbarians. There is only one thing to be said in palliation of it—although it is somewhat ludicrous to offer it as palliation to a community which believes in truthfulness in public as in private affairs—and that is that many if not most of its promoters do not desire its passage, and believe the President will veto it. They do not expect it to stop Chinese immigration, and do not much care whether it does or not; but they want somehow to secure the support of the Pacific slope at the next Presidential election either for themselves or their party, and for this purpose are ready to hold any view, either on "caste" or "human rights," which seems likely to command most votes.

In saying all this we are not disposed to pooh-pooh the arguments of Senator Sargent in support of the bill. It is not candid to say, as many of us do, that the hostility of the Californians to the influx of Chinese is due simply to dislike of cheap labor, any more than it is candid to say that the hostility of the Southerners to negro suffrage is due simply to race prejudice. California is suffering, both socially and politically, from the multiplication of enormous fortunes managed with an inadequate sense of moral and social responsibility, and leading to immense land monopolies, which begin to bear a close resemblance to the *latifundia* which, Pliny said, "ruined Italy" by the extirpation of the free yeomanry. Nothing would do more to promote these great accumulations of wealth than a profuse supply of cheap and contented labor, and the result would soon be a form of society not unlike that which slavery created at the South, and which, whatever may be said in its favor, is one which is totally unsuited to the American system of government, and almost unmanageable by it. If such a form of society is growing up anywhere it is not bad politics to take early measures to check it. Measures intended to *shape* the social system are taken in nearly all the States of the Union by the laws of descent, and in this State by those relating to the tenure of land, as well as in other ways.

There *is* a distinction, too, between Chinese immigrants and other immigrants, and it is one which may be marked by American legislators without any repudiation of the theory on which foreigners have hitherto been invited to settle in the country. Foreigners have been invited and encouraged to come because it was expected that those who came would come to stay, and as a matter of fact this expectation has been realized. All but a handful of the millions who entered the United States since 1800 have rooted themselves in the soil, and their descendants are now Americans. It is not at all probable that the invitation would have stood very long in its unqualified form if it had brought simply a swarm of sojourners, intending to remain foreigners while here, and proposing to return home in a few years. Nor could the Government have stood the strain of the presence of a vast body of persons owing it no allegiance and feeling no interest in its safety or success. Some means would have been resorted to either to compel immigrants to cast in their lot with the country or to restrict their numbers.

The Chinese, too, are something more than foreigners who refuse to be naturalized. They are foreigners whose numbers are prodigious, and whose overflow into all the countries within easy reach of their own is exciting the hostility and alarm of all who find it impossible to enter into competition with them without seriously lowering their own standard of living. It is not the Californians alone who are hostile to them. The Australians and New-Zealanders, eager as they are for immigrants, are not willing to accept the Chinese in lieu of any other laboring population, because the ready reception of them apparently is likely to result in their extirpating all rivals in such callings as they follow. It may be creditable to the Chinese that they are able to do so, but it is not unnatural that their rivals should be unwilling to accept their fate or to acknowledge that the laborer is nothing but a machine, and valuable only for the small cost at which he can be made to produce. A state is after all not a manufacturing company simply. It is an association for moral and social ends, to which a man who remains in it all his life as a stranger, and spending nothing but what barely suffices to support life, contributes little or nothing. This objection, too, has a force as applied to the Chinese which it is far from possessing when applied to any other race. No people in the world is so impervious to foreign influences. Their civilization is not only older than ours, but older than our "ancient world." How after having advanced so far in arts and arms they came to stop where they are, and take upon themselves a yoke of custom so hard and fast that four thousand years have hardly left a mark upon it, is one of the problems of history which have thus far baffled all investigation. What is most extraordinary in Chinese civilization, however, is not that it has made Chinese society immovable and impregnable, but that it has given the Chinese population a persistence and vitality unknown among other races. They can live and work hard in all climates; they take and lose life with absolute indifference; their armies in Central Asia advance with such deadly perseverance that they plant and reap corn after one campaign in order to prepare for the next, and they kill the males of conquered districts with the same calm with which they throw a bridge over a stream. They are recently slowly adding European arms and discipline to the stock of their acquisitions, and if they can produce generalship, they will be a power which no other nation can safely attack and which all neighboring nations must dread. These things must be borne in mind by those who propose either to kick them out as barbarians or receive and try to educate them as barbarians. They are men of an older and, if not stronger, far more tenacious civilization than our own. We have evolved as yet no force or influence likely to make the smallest impression on them. If they were likely to come in great number to California—which we do not think is true—they would easily take possession of the State. That the very gelatinous religion and morality and customs of that region would supply an agency capable of absorbing or changing them, is an idea which sounds well in lectures on the rights of man and on the mission of the American Republic, but there is no basis for legislation in it. It somewhat resembles Mr. Burlingame's pleasing dream that the Chinese were ready to "plant the shining cross" on all their hilltops.

The debate on the bill was useful in one way. It forced some declaimers like Mr. Blaine, though to their own confusion, to approach the race question in a practical way. The Chinese problem in California has a very close resemblance to the negro problem at the South. The question which both cases present is, What is the

best mode under our American system of government of enabling two different races of different degrees of civilization to live peaceably together on the same soil? The natural method of solving this is the business method. We are bound to find out what is reasonable and remediable in the demands and complaints of *both* sides, and try and provide a *modus vivendi*, not with the view of carrying out the glorious principles of the *Contrat Social*, but of giving everybody the largest attainable amount of security and comfort. It is not right in dealing with California to listen only to the demands of the "hoodlums," as Mr. Blaine does, any more than it is right in dealing with the South to turn a deaf ear to the complaints of the whites. If it be reasonable in a Californian to threaten to burn and ravage unless he is rid of a class of laborers whose food and sleeping arrangements and religion are disagreeable to him, and who are not moral enough for him, even though they seek no share in the Government, it is not criminal or unreasonable in the Southern whites to object to be ruled by a majority composed of ignorant Africans just emancipated from a most degrading form of bondage. Mr. Eustis, of Louisiana, turned this obvious argument on Mr. Blaine and his Republican allies most happily, and the attempts of the latter to escape from his tormentor were pitiable. His only defence was that the negroes were born here; but if this be sound, he would put up with the low diet, the low morality, the low wages, and the heathenism of the Chinese if they had chanced to be born here. So it depends, after all, on the little accident of a man's birth whether we ought to expel him as a nuisance or make him governor of a province. The fact is that if the Southern whites are wholly irrational and unworthy of attention, so are the "hoodlums." There is, however, a great deal in the complaints of both which merits the serious attention of statesmen, and which ought to be dealt with in a practical and conciliatory spirit, making due allowance for prejudice and for self-interest, but none for cruelty and greed, and keeping the public welfare and the interests of our own civilization steadily in mind.

ENTRIES FOR 1880.

ALTHOUGH only two years have elapsed since the terrible struggle of 1876, and the Presidential conventions of 1880 are as yet distant by more than a year, the campaign of 1880 has evidently already begun. During the past three or four months it has raged in the columns of the *Tribune* with great violence; during the past fortnight it has broken out at the sessions of the Potter sub-committee at the Fifth Avenue Hotel; and since the adjournment of that committee the press all over the country has taken sides in it. Apart from its bearing on the campaign of 1880, there seems to be no reason why Congress should order an investigation into the cipher despatches. The persons whose acts are investigated in connection with them hold no official positions; Messrs. Pelton, Marble, and Weed may not be thoroughly good men, indeed they apparently are not, but why should the Congress of our common country care to know how far short of the "truly good" in character they fall? Mr. Tilden, too, is a private citizen—a man unquestionably of powerful mind and large means, but still a private citizen. The only ground on which the investigation is reasonable at all is its bearing on the cipher despatches as an "issue" in the campaign of 1880. The cipher-despatch question has even now all the marks of such an issue. The *Tribune* has got out an "extra" on the subject; a mass of testimony has been taken by a committee, which proves precisely what the public already knew from the newspapers; and all the material facts are denied by the person mainly implicated. It is noticeable, too, that all the newspaper reports of the testimony of Mr. Tilden contain marked indications of that increased moral temperature which is one of the most striking symptoms of the raging of a Presidential campaign. In the Democratic papers the witness takes the stand pale but firm, gives his direct testimony in a straightforward manner, and on cross-examination baffles and staggers his questioners with the astuteness of his replies. In the Republican papers he totters up to the stand, hardly recognizing his friends around him, and, trembling with palsy and guilt, repeats a story committed to memory in advance. In the end, however, his deep villany does not avail him, for under a searching cross-examination by the undaunted minority he winces, cowers, and evades answering the questions put to him, and leaves the stand overcome with exposure and shame. If the campaign of 1880 is not upon us, what does this mean?

On the other side, there is no surer indication of the beginning of a campaign than the appearance of the biographer. It is the duty of the biographer to clear up the obscurity which frequently darkens so sadly what should be the most famous passages in the life of the candidate; or, if he happens not to be obscure, to perform the closely analogous duty of chronicling the sayings, thoughts, and doings of his subject. In the case of a candidate like Mr. Hayes the biographer proper was needed, and Mr. Howard performed his duty so thoroughly that the leading facts of Mr. Hayes's career were brought within the reach of the meanest intelligence early in the campaign of 1876. In the case of General Grant, of course, a biographer is not needed; but in his progress through Europe and Asia the accurate chronicle of his speeches, thoughts, and movements, forwarded every week or so to the press, answers the purpose which biography serves in the case of an obscure man. We learn what he thought of Sumner and Motley, and Bristow and Belknap and Babcock, and all the other great men of his time; how he regards the European armies and their generals, and what he has to say about the battle of Shiloh. We have examined these reports of General Grant's table-talk with care, and have failed to find in them anything of any intrinsic interest or novelty, and, therefore, are forced to conclude that they too are indications that 1880 is upon us—a conclusion which is confirmed by the fact that General Grant, whenever asked his views as to his own candidacy for 1880, invariably replies that he does not mean to run, but qualifies this with the assurance that if "the people" want him very much he may be forced to reconsider his determination. Anybody who feels his duty to the people as strongly as this never, according to our observation, fails to sacrifice his inclinations to the public interest as soon as he is convinced that one or more powerful States will go into the Convention "solid" for him. As to this, General Grant is said to have already received positive assurances.

We may then fairly consider that the candidates for 1880, at any rate until the nominations are made, are to be Grant and Tilden, and it will be well to inure ourselves to the thought. It is already obvious that the campaign, when we are fairly embarked on it, will be one of no ordinary interest, and will turn mainly on questions rather of character than of policy. Between Grant and Tilden there can be no question as to hard money, and the Southern question does not promise to be as exciting in 1880 as it was in 1876, because there are no Republican returning boards in the South now, and no chance of any Southern State being carried by the Republicans. The election must, therefore, turn mainly on the relative character of the two candidates and their personal fitness for the position of President. We will endeavor to outline the course the campaign will probably take.

Both men have been before the public a good while, and the process of "exposure" has been applied to both of them with considerable thoroughness. Nobody, therefore, need allow himself to be placed in the unfortunate position in which many voters in the last campaign found themselves, of ignorance as to the past moral career of their candidates. Both General Grant and Mr. Tilden may be said to be distinguished for the eminence of their public services and the notoriety of their characters, and a large mass of documentary evidence on the subject is accessible to every one, in the shape of committees' reports, *Tribune* extras, *Times* supplements, and campaign text-books. The three most dangerous vices in public men are, of course, intemperance, dishonesty, and bad company; and in these respects it is easy to institute a pretty thorough comparison between the two favorites for 1880.

In the first place, it is in the power of the Republicans to prove that Tilden is an habitual drunkard, and that he, while Governor

of the State, being at the time drunk, drove into and seriously damaged the carriage of an inoffensive citizen on the public highway (*vide* the *Times*, *passim*, for 1876). One reply to the charge is that Mr. Tilden, at the time, was sober, and that his horses were being driven by another gentleman; but the most effective is that Grant is himself an habitual drunkard. The charges of intemperance may be said to offset each other. At any rate, it would be impossible to say which was the hardest drinker, or which would be likely to be most incapacitated from public duty by drunkenness, without some sort of competitive examination of the two candidates while under the influence of drink. This sort of a test, however, though it might be invaluable to the country, is probably too old-fashioned in character for modern taste.

With regard to integrity, Tilden's record is not all that a warm supporter could wish. We are not disposed to lay much stress upon the cipher negotiations with Republican electors in the South, for in these his favorite nephew was involved, and when integrity is subjected to a strain under the pressure of a warm family affection a man ought not to be judged too harshly. Besides this, when General Grant was accused of sacrificing public interests to the necessities of his family, the utmost he was charged with was Nepotism, and it is perhaps hardly more than fair to set down Mr. Tilden's unfortunate connection with the cipher negotiations to his warmth of affection for his nephew, and to call the account square. It must not be forgotten that Mr. Tilden did not profit by the negotiations any more than General Grant did by his jaunt to Boston with Jim Fisk and Jay Gould on the Fall River boat, or the subsequent remarkable rise in gold on "Black Friday," or by the post-traderships to which he helped his brother Orville Grant, or the San Domingo annexation scheme.

There are, however, other facts in Mr. Tilden's career which are not lightly to be passed over. The income-tax suit of the Government against him has never been brought to trial, mainly because whenever the case is called, the Government's counsel (if a political campaign is going on) answers cheerfully, "Ready for the plaintiff," while the defendant insists on a postponement; and when no campaign is raging defendant's counsel declares himself ready to proceed on his side, while the plaintiff urges the case on by filing a bill of discovery. Added to this, the thievish habits of the defendant, which lead him every now and then to steal the books of account necessary to the proofs in the suit, make the truth difficult to arrive at. Still, it is admitted that Mr. Tilden did refrain from making a declaration of his actual income for purposes of taxation during several years, and this of itself has very generally been regarded as sufficient proof of his criminality. We must add to this his plunder and wreck of the Terre Haute Railroad, and his circulation of bogus currency among the poor miners of Michigan, and the total destruction of the once smiling village of Brady's Bend. Finally, with regard to the men with whom he surrounds himself, and with whom he co-operates to further his political advancement, it must not be overlooked that besides Weed and Woolley, he was at one time a "coparcener" with Bill Tweed, and wrote him a letter addressing the Boss as "dear Tweed," and contributed, if we remember right, to his campaign fund.

With regard to Grant's integrity, there is no evidence that he personally profited by the operations which went on under his eyes in Washington; but as a "gift-taker" he is equalled by no one. In the campaign of 1880 the house at Long Branch and the other house at Washington will no doubt figure, and as a neglected subject of investigation we might throw out a suggestion that his transactions in horses would be worth looking into a little more carefully than has yet been done; and that the history of the $25,000 sent by Mr. Abel Corbin, General Grant's brother-in-law, to the White House in September, 1869, has never been made as clear as the people are entitled to have it made. In order properly to compare him with Mr. Tilden we must strike a balance, if possible, between the direct felonies of the one and the permissive plunder under the other. The Whiskey-Ring conspiracy, in which, after issuing his celebrated order to "let no guilty man escape," he communicated to the person chiefly implicated the Government testimony in order to enable him to prepare his defence; the District of Columbia Ring, headed by his particular friend, "Boss" Shepherd, whom he reappointed to help govern the District as commissioner as soon as he had been turned out for plundering it as governor; the safe-burglary conspiracy, a transaction so closely connected with the government of the District as to make it necessary for General Grant to invite one of the gentlemen principally involved to the White House while under indictment; the post-tradership and Black Friday scandals just referred to—all these incidents of General Grant's public career will be of use in 1880.

Not only will all these matters have to be reconsidered in 1880, but such is the acrimony of a closely-contested Presidential campaign that one of the most beautiful traits of the characters of both candidates—their warm adherence to their friends—will be pressed into service. In the Democratic campaign text-book of 1876, a compilation full of partisan venom, numerous instances of this trait are given, the facts being always distorted so as to make them out a case of the sacrifice of public interest to personal friendship. Why, the Democrats say, was Schenck kept at London after the Emma Mine scandal had become public? Why were Ackerman and Williams made Attorneys-General, and Williams nominated for the Chief-Justiceship? Why was the son of the American Minister at Paris allowed to make use of his position to effect engagements for circus-riders? Why was Mr. George Butler allowed the run of Egypt as a representative of the United States? Why was Dr. Newman sent around the world inspecting consulates of which he knew nothing? Why did General Grant write a letter to "Tom" Murphy, thanking him for the "efficiency, honesty, and zeal" which he had displayed as Collector of the Port in this city? It is sad to think that questions of this sort will be asked, but poor human nature is so constituted that the chief part of the art of government as at present practised among us consists in asking such questions and "pausing for a reply." In the present case undoubtedly the true replies are: Has Mr. Tilden ever paid his income-tax? Has he returned those bonds to the Terre Haute road? What are his relations with Mr. William T. Pelton?

Such, as we understand them, are the broad general outlines of the campaign of 1880 as it stands. We are unable at present to give a decided opinion on the merits of the rival candidates, but shall endeavor as the time passes on to keep our readers informed of the latest developments, trusting that it may all come out right in the end and the best man win.

THE RAILWAY DELUSION OF WHOLESALE AND RETAIL.

WE recently expressed the belief that a National Law which shall compel Railways to make public all matters pertaining to their compensation for all descriptions of service, is an essential preliminary to any effective attempt at learning to what extent, if any, national regulation of railway transportation shall be required or permitted. No expert, however familiar with the general subject, can hope to drag to light those discriminations which all who have been concerned in them are so bent on, and have grown so wonderfully ingenious and skilful in concealing, unless assisted by a law not limited by State lines, not capable of long successful evasion, and provided with penalties that will carry more terror to official respectability than mere money fines, which the corporation will pay. To be effective the penalties must reach the persons and purses of offending individuals, as well as the coffers of the companies.

The same act should be so framed as to prevent farther ill-effects from the Wholesale and Retail delusion, which has already done great harm to the country at large, and to the railways themselves. The justification for this interference is to be found in the history of the rise and development of our railway system. We needed railways, and we got them in any way we could. City, county, State, and National Government means have been joined pell-mell with individual purses, poor and rich; while foreign coffers have been tapped by golden promises, and every sort of device which could coax or seduce money or labor into the creation of our railways has been resorted to. It is a curious and wonderful history. Such a mass of eager incompetents as have been selected to manage the "enterprises" projected in every locality—boards who knew nothing of

the business, and who were selected chiefly for their supposed influence in commanding money; presidents who did not differ in quality from their boards; engineers who, if skilled at all, were, as a rule, only skilful in the technique of their profession and were unfitted to adapt investment cost to the expected traffic. The result of such mad energy has been truly American. First we have the railroads; they are here, all alive, all useful, all improving. Next we have had almost universal railway bankruptcy. In the complete list of our railways now built there is scarcely one which has from the beginning, and continuously, paid a fair interest on its entire cash cost. Many of them have passed through a legal readjustment, which has reconciled their capital account with the trade-contributing power of their territory by the painful process of obliterating most of the former from their books. Amid all this, however, we have been receiving an education; some sort of system and much good knowledge have been already evolved, and the process is going on with rapidity. The costliness of the roads has prompted their managers to seek in every quarter for a commensurate revenue. It has been sought from trade in regions naturally tributary, and in regions altogether the reverse; it has been sought by exacting high charges on traffic which no rival road had access to, and by every sort of open and surreptitious tariff reductions where competition existed. This crude and violent struggle has bred a multitude of inequitable discriminations between localities and between shippers, but it has yielded to the country one useful result which will never be lost: it has trained transporters in the art of effecting great movements with almost inconceivable cheapness. It has also given an impetus to another important movement which will never rest until its perfect work shall have been accomplished: the movement, namely, toward unity and simplicity in the operations of our vast network of comparatively little railways. The shapes which this impulse have hitherto taken are some of them extremely undesirable; such, for instance, as the accretion under one control of many roads. It will be better for the country and better for the companies when for this method of effecting unity and controlling traffic is substituted an efficient National Law.

At present the drift of public sentiment, and perhaps the convictions of competent students, point to a union of the two agencies, Government and combinations of individuals, as better fitted to perform the great task of transportation than either by itself. The share which the Government should take, it is pretty well settled, should never be that of operating management, and rarely that of an investor or owner. It must lend its sovereignty to secure the land whereon the road shall be built, and it must endow the combination or corporation with suitable and sufficient powers. Thus far all parties are substantially agreed. The conviction is also growing that the National Government must so far join in the work as to give substantial operating unity to what is now in many respects a disjointed and contentious aggregation, and to prescribe such bases for the conduct of the service as shall ensure substantial equity to all localities and to all persons. It must begin by fixing an equitable limit to the Wholesale Rate. It is a judicious and well-founded commercial doctrine that transactions of large volume can be wisely made at a much less profit per any given unit than should be expected on petty dealings. But in the application of this law there are the two unwise extremes of either regarding it too little or applying it too extensively. The latter is just now much in vogue on railways, and has developed some grave evils—serious social disorders and business disaster to numbers of thrifty and enterprising people.

It is probable most transporters would promptly name the car-load as the proper limit of the Wholesale Rate. Omitting any reference to distance, it is a very natural unit or line of division. The expense of moving a half-loaded car practically differs but little from that of moving one fully loaded. It is also true that there is very little difference in the cost of moving a full or half train of cars, and that the full train of full cars entails the minimum expense per ton. But it is seldom that a single shipper can furnish a full train at regular periods; and when such is the case, that very power gives him a dangerous control over the income of the road. Full and regular trains will more surely follow a policy which creates a multitude of moderate shippers, as will always be the case when the conditions for creating trade exist, and the transporter adopts the car-load as the only unit for wholesale rates. Shipments less than a car-load are more costly to the carrier per unit of weight than larger ones. Higher or retail rates can justly be applied to them, and will not improperly burden the public.

If a manufactory of carpets had several valuable customers, who each purchased a good line annually, its manager would not look with favor upon a proposition from one of the number so to reduce prices to him as to enable him eventually to drive the others from the field. He would naturally ask whether the total purchases would be then increased; if not, what object there could be in such a step. It would help the customer—that would be evident; but how would it serve the maker? True, one man would then buy as much as six, and his trade being six times larger than any other person's had ever been, he should, according to some current railway practice, be given a wholesale rate. If a wholesale price is to be based simply on the element of quantity then the supposed single buyer should have the desired concession, but if other elements properly enter into the question those elements should have their due consideration and influence. A seller who reduces his price per unit does so chiefly because he is reasonably certain thereby to increase his total profits in any given period of time; or, to put it in a different shape, not only his total business, but his total profits in a month, or a year, or a decade should be greater than they would have been under the policy of a smaller trade with a larger profit per unit. Moreover, if he is a prudent man, he will wish to guard carefully against the probability of finding his own business drift into the control of any single wholesale customer. Any one who, when making wholesale rates, disregards these two important matters is building his business house on a sandy foundation, and it will certainly come to harm.

The unwise use of wholesale rates is peculiarly injurious to a railway. The probabilities of a foolish resort to it are much greater when the ability to employ it, instead of being vested, as in the supposed case of the manufacturer, solely with the watchful, well-trained, and alert proprietor, is placed in the hands of a single officer, frequently possessed of little commercial experience, not interested beyond his salary, and wielding the power inherent in an investment of millions almost without any practical supervision by its actual owners. The evil effects of any such folly are multiplied to a railway by as many times as the sources of its revenue are varied. The carpet-maker, whatever he may do, has but one fountain of profit to be damaged, and that is the gain on the carpet he may sell. But a railway company which by a well-known, uniform, equitable, and apparently assured policy, has attracted many forms of industry to the line of its road, carries not only their products but the people connected with them, and all the material which those people use. Should it reverse that policy, and, by employing the destructive power of discriminating rates, concentrate into a few hands the control of any one of its large tributary industries, it will subject itself to the monopoly thus created, and blight everywhere within its influence the chief portions of the incidental traffic which its juster course had brought into being. Perhaps the most striking instance of this which America has yet seen was described in a recent address of the petroleum-producers to the Governor of Pennsylvania. Many small refineries formerly lined the railways along the valleys of the Allegheny River and its tributaries. Under equal rates of rail carriage they enjoyed a moderate prosperity on small profits. They have mainly disappeared; the works have been dismantled; the owners are bankrupt; the laborers and all dependent upon them are gone. They have given way to one huge concern, whose factories are chiefly elsewhere, whose annual net revenues are computed by millions, and who can dictate not only what rates the railways may charge, but what proportion thereof they themselves shall receive.

It is remarkable that in the case of the oil-traffic the real object of the roads was totally foreign to all questions properly involved in the consideration of wholesale and retail rates. That object was Combination. They had fought over the oil-trade, as over every other sort of traffic, to the point of mutual ruin; and their contests had been ingeniously stimulated by the very party which aspired to the profitable rôle of peacemaker, and finally secured it. Its method was so to apportion its own shipments among the competing roads as substantially to assure to each a previously agreed percentage of the whole oil movement. Its price for this service was a secretly paid share of the liberal rates which the roads were thus enabled to charge—a share which has ranged from one-fourth to something in excess of one-half. Armed with the crushing power of this monstrous discrimination, it at once entered upon a course avowedly designed to destroy or acquire all other property engaged in the same business as itself. In the execution of this purpose it has been painfully successful. The disastrous effects of the whole procedure are slowly coming to light through investigations now making by Congress, and under the auspices of the Supreme Court and other authorities of the State of Pennsylvania. They fully account for the well-restrained but bitter and seething temper of the oil regions in the same State, which has at times almost reached that consuming stage when, despair-

ing of justice through the regular tribunals of law, a rude equity is wrenched from unjust power by a spasm of destruction and terror.

THE FRENCH REPUBLIC BEGUN.

PARIS, January 31, 1879.

I CAN with difficulty realize that I have within the last twenty-four hours seen the opening of a great historical epoch and the closing of another, which I may be allowed to term a long period of eclipse. The Republic which up to yesterday was a prisoner, but not a despairing one by any means, is now free and triumphant, and has committed the direction of her affairs to a citizen whose whole life has been spent in combating, sometimes actively and with militant vigor, sometimes passively, and at all times earnestly and ably, the one-man system of government which nowhere was more deeply rooted than in France. We have a President who is the enemy of the office which he fills, and who is sincere in his enmity. There is no more faithful servant in all France of universal suffrage. He voted against the institution of the Presidency in the Constituent Assembly to which, thirty years ago, he was returned by his native department of the Jura. He again refused to vote for the constitutional pact proposed by M. Wallon, which assured a regular status to the Third Republic. His reason was that it did not abolish the principle of personal government, which he had ever combated. It is in virtue of this pact that he was himself elected yesterday President for seven years in the room of MacMahon, who, overborne by the march of events, found himself obliged to "go out," as he had been forced to "give in" upon the 14th of December, 1877. Gambetta in his Lille speech, for which he was prosecuted by the 16th of May Government, laid down the alternative of *soumission ou démission*. The 24th of May, incarnate in the person of the Marshal, has done both. Nothing MacMahon ever did in an executive capacity became him so well as his exit from the political stage, for which he was so ill-fitted by temper, frame of mind, prejudices, and profession. He has returned with dignity to private life, and, in quitting the Presidency, has retrieved the fair name he had won as an honorable soldier, which was compromised by the intriguers of whom he was the blind, the obtuse, and the inappropriate tool.

The liberation of the Republic was in one very striking respect unlike every great event that I ever witnessed in France which was accomplished amid universal satisfaction : it was marked by no sustained outburst of gladness. The electoral ceremony was imposing, and soon gone through, but without indecent haste. On Wednesday night "the resignation" was felt to be inevitable, and M. Émile de Girardin, to be ahead of the event, announced it as an accomplished fact. His paper containing the news was cried about the Boulevards. Next morning those journals of the throne, the altar, and the alcove which have supported reaction at the Élysée gave out that MacMahon, yielding to the instances of the Duc de Broglie and his son Patrick, was going to add another word to his motto. Henceforth it was to have been "J'y suis, j'y reste, et je résiste." Small heed, however, was given to this piece of bravado, and the deputies and senators, who were convened for ten o'clock at Versailles, went there anticipating victory, without being elated by the favorable turn the tide of politics had taken in favor of the Republic. Very few Reactionists left Paris by the early train. They did not wish to be spectators of the prologue to their own discomfiture, and they met in the bureaux of the *Gazette de France*, a fusionist journal, to confer with each other on the line they were to follow at the presidential election which they felt was imminent. General Chanzy was their man. The principle of authority was best represented by a sabre. It was better to hold completely in reserve the Duc d'Aumale and not to compromise his dignity by putting him forward in a struggle in which he must be beaten. The army, which was the last hope of the Monarchical parties, would also be flattered by the preference shown to a military man, and it was to be hoped it would be irritated at seeing a *pékin*, *i.e.*, civilian, invested with executive power.

Few journalists or sight-seers went by the ten o'clock train. In the greater number of instances they travelled to the parliamentary capital by the half-past twelve express. When they arrived there they made for the Senate, and were not long in learning that the Marshal had come from the Élysée in his fast brougham, seen Dufaure at the Presidency, and handed him his resignation. MacMahon, the rumors ran, was unnerved from the emotions and excitement of the last three days, but comported himself with dignity, and appeared glad to be done with the high office which he had occupied for more than five years. He had appointed to meet his wife, children, and a party of intimate friends at dinner in the evening at his private residence in the Rue de Bellechasse, which servants had made ready two days previously for the reception of the now ex-presidential family.

Early in the morning he sent to the Ministry for Foreign Affairs to know if any untoward incident had arisen in that department owing to the crisis ? None, was the answer given by a head clerk to the aide-de-camp who took the message. M. Waddington had come to Versailles with the other ministers, and was prepared to state in the Senate that he had not the slightest cause for apprehending that any of the great Powers would interfere with a question of internal politics, or that the transmission of power from MacMahon to Grévy would be attended with any consequences of a nature to endanger the peace of Europe. The joy caused by all this intelligence, which circulated from mouth to mouth in the lobbies of the Chambers and the Gallery of the Tombs, was too profound to be demonstrated. The Bonapartists, when M. Rouher appeared, grouped themselves around him, and, whether because gladness is contagious, or because the election of Grévy, Gambetta's rival, was certain, gaily chatted among each other while awaiting the sitting of the Upper House, which was to begin at three o'clock. M. Edmond About was the most radiant and excited of any of the Republicans. He ran about rubbing his hands and repeating to every acquaintance whom he met the tidings which his sub-editors and reporters kept bringing him from the rooms in which the bureaux were deliberating.

Before the Senate opened everything that took place during the opening hour was as well known as if we were awaiting the rising of the curtain at a play, a very complete bill of which was furnished to each spectator. All that was not known was the text of the Marshal's letter, which was to be read to both houses. It amused people to hear of M. Gambetta being relegated to the Speakership of the Lower Chamber. The project was thought ingenious. Grévy said at Tours that Gambetta would die "dans la peau d'un factieux," and was one of the most systematic enemies of his dictatorship. The two men are out of sympathy with each other. If Gambetta had been elected yesterday he would have worked for a revision of the Constitution "in an American sense"—that is to say, giving the power wielded by Mr. Hayes to the head of the Executive, *plus* the command of a vast standing army and the enjoyment of splendid palaces which were luxuriously furnished for kings, emperors, their wives and their ministers. With the authority derived from this position there would not have been the checks of sovereign States, State legislatures, American independence of character in the people, and the practice, time out of mind, of free institutions. It is also a well-known fact that Gambetta hoped to get Dufaure returned by the National Assembly successor to MacMahon, and he industriously put him forward as the best man to give a conservative gloss to the Republic. The timid would find in his election a guarantee of order, and the Powers a security against France becoming a centre of international agitation. Secretly Gambetta flattered himself that the aged jurisconsult's mistrust of rapid progress would have enabled him still to make his voice heard as a tribune and an agitator, and keep his name prominently before the public. Publicly he proposed Grévy at the Circus, when he spoke there ; secretly he manœuvred against him. When Dufaure's resolution to quit public life was made known to Gambetta on the memorable 30th he hid his feeling of bitter disappointment, and went with the Republican tide at the meeting of the bureaux where the claims of candidates were looked into. Gambetta's position as chief of the majority would have been an awkward one if he remained a simple deputy. His prestige would have rusted from inaction. If he attacked or became the rival of a government whose honesty and moderation have won the confidence and gratitude of the nation, he would have risked his popularity and alienated the best Republicans. As President of the Chamber he will be placed above the disputes which may be carried on hereafter between Right and Left, and sections of these two great divisions. A handsome salary will be quietly earned, and Gambetta is by no means indifferent to his monetary interests. Being Speaker of the Lower House will enable him to avoid the defeat which awaited him if he again dictated to his colleagues to elect him president of the Budget Committee. But the most important considerations are that M. Gambetta is precluded from becoming a disturbing element at the bidding of M. Allain Targé, who provoked the crisis at the beginning of the session, and that as Speaker he will be trained to listen patiently to his adversaries' discourses and to sit in the chair in a becoming attitude. And in a public man in France attitude goes a long way. Gambetta in his place in the Chamber rolls about, dictates silence in laborious pantomime to his followers if he wants to hold them back, and when he is at rest spreads his arms on his desk and leans his chin on his hands at the point where they cross each other. Since yesterday he can no longer

hope to be President for seven years. Grévy's is a better life than his, and the actual chief of the Executive, if he do not die before the close of his septennate, may be re-elected.

The public sitting of the Senate only lasted ten minutes. It was in the highest degree an impressive one. Martel, the President, whose election was the first check Gambetta's ambition has met with this year, rose, pale and visibly tremulous from emotion, to read the Marshal's letter, which was not the least dramatic feature in the great chapter of French history which posterity will know as "the 30th January." A thrill ran through the hall and galleries. MacMahon wrote in a simple, unvarnished, manly style, and in the closing sentence, in which he declared that love of country had been his governing motive, there was a tone of sincerity which drew tears from the eyes of many who were no friends of his. A solemn silence was maintained while Martel read. A few timid "très-biens" were emitted on the benches of the Right. The *revanche* of the 24th May was accomplished.

The rising of the curtain—everything was so dramatic that I may be suffered to use theatrical phraseology—was followed by the entrance of a Ministry which has deserved better than any anterior one the gratitude of the nation. The venerable Dufaure was the hero of the moment, it being known to all how he had refused the high office proffered him. Lepère, Under-Secretary of State for the Interior, has the physiognomy of an undertaker. He ascended the tribune. What could he want to do there—to read the last dying words? No; it devolved on Grévy to perform that duty. M. Lepère merely wanted to place a bill upon the table. He disappeared when he had accomplished this formality. Grévy, with the cold dignity which is natural to him, arose in his place and read MacMahon's letter and the articles of the Constitution providing for the election of a new President. He therefore announced that the two Chambers would meet in the House of Deputies in a National Assembly at half-past four to fill the vacancy. At the close of the Assembly's deliberations the Lower Chamber was to reassemble to fix the order of the day for the morrow's sitting.

How yesterday's proceedings condemn the Carlyle school of historians! The Presidential vote was a nominal one, and appeared, the result being known beforehand, tedious. Each member of the Assembly advanced as called by an usher in alphabetical order and deposited his bulletin in a ballot-box. A thunder of applause greeted Dufaure in his advance from the Ministerial bench to the ballot-box. A shout of laughter marked the dropping in of M. Numa Baragnon's vote. It was he who said that the moral-order Government "ferait marcher la France," and he was the noisiest among the victors on the 24th May. Baragnon is thought to have given the single vote for the Duc d'Aumale. At 7.40 the bulletins were counted and the result proclaimed by Martel, who presided over the National Assembly. Victor Hugo's description of the Neva emancipated by the sun from its icy bonds and rushing into the Bay of Cronstadt applies to the aspect of hall and galleries when Grévy was proclaimed. The delight many experienced was enough to have sent them back weakly invalids to Paris.

THE ARREARS OF PENSIONS BILL.

To the Editor of The Nation:

Sir: I would like to give a word of testimony bearing on the recent "Pensions Bill," and I have no doubt that my experience has been that of hundreds of others. I served three years in an infantry regiment, and being the only commissioned officer in my company when we were mustered out, I have since that time received many applications for sworn statements which should serve as the basis for pension claims. Of course, all those disabled by wounds and those discharged from hospital during the war, if they were deserving cases, received pensions from the time of discharge, and would in no way be affected by the recent bill. I have invariably made it a rule to state nothing in these affidavits which I could not swear to of my own personal knowledge, but, so far as I know, every applicant has received a pension, though in most cases I could only testify that "—— was borne upon the 'muster rolls' as 'absent, sick,' from —— to ——." In almost every instance that I can now recall the applicant was a comparatively worthless soldier, either from cowardice or laziness or previous ill-health, and, as a rule, received far more from the Government than he ever earned while in its service. It is for this class that the recent demagogic bill proposes to take untold millions from the United States Treasury. I do not say that *none* of this money would be worthily bestowed, but I do affirm that for the *most part* it will go to a worthless set of shirks and "bummers," instead of to those by whose labor and hardships the country was saved in that life-and-death struggle.

"TRADUTTORE TRADITORE."

To the Editor of The Nation:

Sir: In Section VII. of Lalor's recently published translation of Roscher's 'Political Economy' occurs the following:

"In estimating the resources of a whole people it is, of course, necessary to make deduction of the debts due by the individual members of the nation to their fellow-countrymen."

This absurd proposition I referred to a friend who, in addition to being an erudite economist, is also an excellent German scholar, with the following pertinent conundrum: In a community composed of two persons, A. possesses one hundred bushels of wheat which he owes to B., who possesses on his part one hundred bushels of oats which he owes to A. What are the resources of the "whole people" according to the text, and what are they in fact?

My friend very shortly disposed of the objectionable text by furnishing me the following literal translation:

"Who would sum up the national wealth must naturally deduct the debts owing to foreigners; those of the inhabitants between each other (he must), on the other hand, leave out of consideration."

What ought to be done to a translator who not only obscures but absolutely inverts the teachings of his defenceless author, I leave for your reviewer to determine when he shall come to pay his attentions to the butchery of this noble work, of which the above is an example.

Economist.

Philadelphia, February 15, 1879.

Notes.

Porter & Coates publish immediately 'Voices from Babylon; or, The Records of Daniel, the Prophet,' by Joseph A. Seiss, D.D.——The sale of the library of the late George Brinley, of Hartford, is announced to begin on March 10 in this city at the Messrs. Leavitt's. No collection of equal value has ever been offered here at auction. Part I., comprising about a third of the whole, numbers 2,619 titles in the catalogue, and consists of general Americana and works relating to the early history of New England and Canada. The competition for these rarities will, no doubt, be highly spirited.——Macmillan & Co. send us Mr. Frederick Martin's 'Statesman's Year-Book for 1879,' an invaluable manual of reference always kept abreast of the time.——R. Worthington is the American agent for the new edition of Pryde's handy 'Mathematical Tables,' consisting of logarithms of numbers 1 to 108,000, trignometrical, nautical, and other tables (Edinburgh: W. & R. Chambers). The logarithms are carried to seven decimal places. A clear explanation of the tables precedes them.——The 'Middlesex County [Mass.] Manual' is recommended by the publishers (Penhallow Printing Co., Lowell) as containing the first history of the county ever printed. Judge Cowley, who has written a 'History of Lowell,' is the author of it. As Cambridge is situated in this county, "Were Middlesex people thus minded," says Judge Cowley, "they might boast of the first printing-press in the United States," as well as of several other important "first things." The typographical appearance of this Manual would not suggest the first-named distinction.——The Fourteenth Annual Report of the State Agricultural College, New Brunswick, New Jersey, contains an interesting account by the Vice-President, Prof. Geo. H. Cook, of his observations last summer, while commissioner to the Paris Exposition, on European methods of agricultural experiment, practice, and training in England and Ireland, France, Switzerland, Italy, Bavaria, and Holland.——The summer expeditions are already sending out their prospectuses. From Boston we receive that of the "Educational-Vacation Tour," managed by Thomas W. Bicknell, and embracing the regular European round by the usual conveyances; from Irvington, Indiana, that of the "Fourth Summer Tramp," of which Prof. David S. Jordan is the chief director, and which invites those willing to "'rough it' somewhat" (ladies included) to Switzerland, Italy, and Normandy.——The *Academy* states that Mr. G. P. Healey's portrait of the explorer Stanley is to be engraved by M. T. de

Mare, under the auspices of the British and Foreign Artists' Association. ——Gen. Sir Arthur Cunynghame, says the same paper, who was commander-in-chief and lieutenant-governor in South Africa from 1874 to 1878, has prepared an account of his travels in that country, of which Macmillan & Co. will be the publishers.—— From Chicago there come to us three Norwegian books by Prof. R. B. Anderson, of the University of Wisconsin. The written language of Norway, as is well known, differs widely from the spoken dialect, and 'Den norske Maalsag' (1874) gives an interesting account of the efforts that, since the separation from Denmark in 1814, have been made by an ever-growing number to supplant the Danish of the press and literature by the "Almuemaal." To the book is appended a story in Norwegian by Kristofer Janson, one of the foremost champions of the movement. 'Amerika ikke opdaget af Columbus' (1878) is a translation for the benefit of Scandinavian readers of Professor Anderson's 'America not discovered by Columbus,' which has been before the public for some time and is now in its second edition. Its object is to establish the Norsemen's claim to priority of discovery. The 'Julegave,' or 'Christmas-gift,' (1878) of fairy tales and stories to the children of the Norwegian settlers on our continent consists of selections chiefly from the charming collection of Asbjørnsen and Moe, and owes its existence to a desire to provide the little ones with entertaining reading in the language of their fathers. Among the tales we recognize such common property of the Aryan race as "Little Red Ridinghood," "Faithful John," and "The Master Thief," while others bear a more distinctively Norwegian stamp. We can heartily recommend them to both young and old.

—We have received from the Hydrographic Office the 'Report of the Telegraphic Determination of Longitude in the West Indies and Central America during the years 1874, 1875, and 1876,' by Lieut.-Commander F. M. Green. This is an instance of the good work that is being done by the military branches of the Government service without any display and without special appropriation. Under the intelligent direction of the Navy Department and Hydrographic Office, advantage has been taken of the extension of submarine telegraph lines in the West Indies to establish secondary meridians by the most exact method known to science—that is, the exchange of time-signals by telegraph, the time being accurately determined by simultaneous astronomical observations at the two stations so connected. The geographical positions of twelve different points have been determined with an accuracy beyond question, and a further extension of this important work on the east coast of South America is now in progress. It is worth remark that the work, with the instruments and methods used, is strictly national, and that probably no astronomical field-work equals in accuracy that of the United States Government expeditions, while the importance to navigation of this special undertaking cannot be too highly estimated. The ascertained position of Morro light-house, Havana, by the way, is lat. 23° 9′ 20″ .98 N., long. 82° 21′ 30″ .0 W.

—*Lippincott's Magazine* for March contains hardly a dull paper, even though we might not affirm the necessity of reading a single one of so many that are readable. For our own part, however, we confess to being the wiser for Mr. H. M. Robinson's 'A Day with Hudson's Bay Dog-sledges,' which is to be highly praised for its humorous and graphic qualities, and gives one a realizing sense of sledging in the frozen North. Never before have we caught such a glimpse of the pangs which the humane voyager suffers in consequence of the infernal cruelty practised by the half-breed drivers upon their teams. Mr. Edward King's account of Vienna does not rise very far above the guide-book level. The biographical sketch of Richard Realf, by Mr. Rossiter Johnson, is more interesting as a picture of human misery and vicissitude than as a suggested rehabilitation of a neglected poet. Realf, who was very humbly born in England, was one of John Brown's men not at Harper's Ferry, a good soldier in the war, a journalist, and an indifferent writer of verses. As his portrait shows, he had an attractive face, but he was by nature changeable and unstable, and half the tragedy of his life at least he prepared for himself. Mr. Howard M. Jenkins writes agreeably on a subject that has any but pleasant associations, the whipping-post in Delaware. He traces the history of it to the present time, apologizes, as is proper, for the original appearance of it in the only State which has retained it, shows what humane sheriffs do to mitigate it, and meets the objections of those who think its abolition would be a premium on wrong-doing. Miss Annie Porter begins a semi-romantic series of articles describing "My Village in the South," and promising to be one of the most entertaining features of the magazine.

—Mrs. Kemble's interesting 'Records of a Girlhood,' which we reviewed at length on its appearance in England, has been reprinted here by Henry Holt & Co. The two volumes of the English edition have now become a single stout octavo of more than six hundred compact pages. The cloth binding is stamped with a design in blue and silver as artistic as it is novel, and the only fault to be found with it is that it is somewhat too delicate for frequent handling. The book, too, is likely to be far more often handled in the present edition than in the original, for the American publishers have added an ample index of thirty columns of fine type, an indispensable adjunct to any book as rich in anecdote and criticism of celebrities as this. They have also adorned the book with a new steel engraving of Mrs. Kemble as she looked in early womanhood. A certain portion of the 'Records of a Girlhood' originally appeared in the *Atlantic Monthly* as "An Old Woman's Gossip," three or four years ago, at which time we recalled the fact that the writer was also the author of a 'Journal of a Residence in America,' which, when published forty-five years ago, raised a terrible turmoil. The last entry in the 'Journal' was dated July 17, 1833; in the 'Records' we have letters written at the same time as the 'Journal,' and brought down to April 24, 1834. The book before us closes with the brief statement of Miss Kemble's marriage, in 1834, to Mr. Pierce Butler. To this event we owe that 'Journal of a Residence on a Georgian Plantation in 1838–1839' the publication of which in England, in 1863, was a blow in the cause of freedom struck at the right time. It is sincerely to be hoped, and indeed there seems every reason to believe, that all of Mrs. Kemble's diaries have not seen the light, and that another store of recollections may some day be thrown open to the public. In the 'Records' (p. 572), under date of April 16, 1833, Mrs. Kemble relates that Washington Irving answered a complaint of hers about the little leisure her dramatic drudgery left her for other intellectual work, with: "Well, you are living, you are seeing men and things, you are seeing the world, you are acquiring materials, and heaping together observations and experience and wisdom, and by-and-by, when with fame you have acquired independence and retire from these labors, you will begin another and a brighter course with matured powers." Mrs. Kemble has lived and gained the experience and the wisdom, and she has set forth some part of the result in these 'Records of a Girlhood.'

—In 1862 Francis Fry published the first of the works which has placed him at the head of the bibliographers of the English New Testament. It was a fac-simile reproduction of the unique copy of "The first New Testament printed in the English Language (Worms, 1525), translated by William Tyndale," preserved in the Baptist College, Bristol. This was followed soon after by "A Description of the Great Bible, 1539, and the six editions of Cranmer's Bible, 1540 and 1541." In the preparation for this work more than two hundred and fifty copies of the different editions were compared verse by verse, and such complete tables of various readings are given that "every leaf of the Great Bible and the six Cranmers can be identified." Mr. Fry's latest publication is in some respects an advance even upon this in bibliographical excellence, as it certainly is in the sumptuousness of its typography and the beauty of its plates. It is a critical examination of forty editions of Tyndale's New Testament printed between the years 1525–1560, the time when it gave place to the Genevan version. All these editions have been examined by Mr. Fry himself with the exception of two which are to be found only, if we are not mistaken, in the Lenox Library, of this city—a library which Mr. Fry refers to as containing "probably the largest collection of rare Bibles and New Testaments, in all languages, in the world." The most interesting result of his critical labors in an elaborate comparison of these various editions is the discovery that the edition of 1534–35 (known as the G. H. version, from a monogram on the title-page) was the last revised by Tyndale just before his death at Vilvoorden. Following the tables of various readings are seventy-three plates of titles, colophons, pages, and capitals. The work is a noble monument to the memory of Tyndale, whose portrait is given, together with a fac-simile of the only specimen of his handwriting known, a letter written in his prison just before his end. A peculiar feature is a page of "slips for cataloguing," inserted at the end of the volume. These are a main title under Fry, with an elaborate collation and two slips for cross references under Tyndale and Testaments. They are intended to be cut out and pasted upon cards, and are the first practical application of a suggestion made originally, we believe, in this country some time since.

—Mr. John E. Owens has just completed a very successful engagement at the Park Theatre, where he has appeared in Tom Taylor's "The Victims," and in "Solon Shingle." Mr. Taylor's plays are already be-

ginning to have an old-fashioned flavor, though it is hard to tell what this comes from, inasmuch as they in one respect resemble the works of the greatest dramatic writers, namely, that they belong to no particular age or country. Mr. Taylor has a thorough understanding of the stage, and he has had the good sense, instead of trying to invent original characters, of borrowing them; and the result is that he is the author of a good many successful plays. In the "Victims," the characters of *Mr.* and *Mrs. Merriweather*, the jealous husband and the sentimental wife; *Mr. Herbert Fitzherbert*, the impecunious and selfish poet; *Miss Crane*, the strong-minded woman; and *Mr. Joshua Butterby*, the dissipated friend of the poet, who in the end marries the heiress—all these are types that have been used over and over again, and which Mr. Taylor found ready to his hand. He has shown his good sense in the discretion with which he has used them. The whole atmosphere of the play is decidedly farcical, particularly the *conversazione* at Mrs. Merriweather's, and Butterby's "great presentation scene," as it is called on the bills, in which *Butterby* gives *Miss Crane* the wrong parcel. Mr. Owens as *Butterby* was very good, but somewhat monotonous. He is hardly a comedian, but excels in extravagant and farcical parts, such as this and *Solon Shingle*. Of the two, the latter is by far the best. It is his own; he is thoroughly at home in it; and low and meaningless as this part is, it is a wonderfully good piece of acting. Indeed, *Solon Shingle* may be taken as a proof of the possibility of making any character, however unpromising in itself, theatrically good. In this case there is nothing put before the audience but the external peculiarities of an aged drunken Yankee loafer, such as may be seen on any winter's day at the village store in New England discussing the condition of "trade" with the proprietor, or making enquiries as to the comparative acumen and ability of leading "cow-lawyers." *Solon Shingle* is not a dramatic *character* in any proper sense of the word at all. He has nothing to do with the development of the play in which he appears, and is throughout a mere comic intruder, who creates a laugh at his peculiarities of speech and action, and his drunken condition. Still, the external representation of this peculiar American type is perfect, and will continue, no doubt, to draw audiences together as long as Mr. Owens acts it.

—Mr. Dion Boucicault's appearance in Irish melodrama at Booth's last week was one of the notable events of a theatrical season quite as much marked by the production of old plays as by new "hits." The "Colleen Bawn," the "Shaughraun," and "Arrah na Pogue" all owe their popularity—and there are few more popular plays on the English stage—to the talent of Mr. Boucicault, who not only wrote them, but long ago identified himself with the leading parts. Indeed the Irish school itself as a branch of the drama may be said to be the creation or invention of Mr. Boucicault; no one else has ever succeeded in producing dramas of the sort, and probably no one else ever will, though we are inclined to think that his plays will hold the stage long after his time for appearing in them has unhappily gone by. There are, of course, many criticisms which may be made upon such a play as the "Colleen Bawn." It is, in the first place, properly a tragedy; no amount of clever construction can ever thoroughly reconcile us to a tragedy distorted into a melodrama. The foundation of the plot is essentially tragic. A marriage between *Hardress Cregan* and *Eiley O'Connor* is clearly out of the question, and hence she must die. So, too, the part of the mother, *Mrs. Cregan*, after she has once resolved on having her son's wife murdered, is essentially a tragic part. The resurrection of *Eiley*, the sudden revival of her husband's affection for her, and the very handsome apology made by her prospective mother-in-law for having ordered her killed, are simply preposterous; they make the play after passing through a tragic phase end like a burlesque. All this is heightened by the part of *Danny Mann*, who has no business in a melodrama at all. *Myles na Coppaleen* is an excellent comic character, and in what we have said of the plot we do not mean to imply any criticism of him at all. He is the stage Irishman of Mr. Boucicault's Irish world, an amusing, shiftless, warm-hearted vagabond, with a lively Celtic wit and a great fondness for whiskey. There is no one who understands how to put this character on the stage as does Mr. Boucicault. Mr. Dominick Murray's *Danny Mann* is a remarkable piece of acting, particularly the death-bed scene. Of Mrs. Boucicault all that can be said is that she looks and acts precisely as she did ten, and we have no doubt twenty, years ago; her voice is perhaps hardly strong enough for the "Cruiskeen lawn"; but she has preserved in the most extraordinary way her youthful appearance and charming manner on the stage.

—The success of Mr. Boucicault's week at Booth's is due, we take it, to two causes—the genuine attractiveness of the pseudo-Irish world into which he takes us, and his thorough mastery of the technical business and machinery of the stage. The Ireland of Mr. Boucicault is an Ireland of the fancy which never existed, as has been over and over again pointed out by exasperated Irishmen, except in the imagination of Englishmen. We do not meet with it at Castle Garden in this city nor in the pages of history. For all that, it is a picturesque and interesting country. These lovely and witty girls; these brave and noble lovers of theirs; these clansmen, faithful to imprisonment, exile, suicide, or murder; these men of God, too, holy enough to give us a little glimpse of a more genuine religion than we are accustomed to meet with in every-day life, yet not too absorbed in their calling to deaden our sympathies; these valiant young patriots who rouse the country against the hated Sassenach; this atmosphere of poetry and sentiment against this effective background of English oppression and tyranny—it may not be true, but it is all thoroughly agreeable. Any one of these plays would be entertaining without any sensational theatrical adjuncts. But when we have in addition the most cunning artifice to help out the interest; when the murderer drowns his victim before our eyes in what is startlingly like a marine cave; and when the patriot prisoner, escaping from the window of a dungeon keep, is by an ingenious mechanical contrivance immediately brought before us on the outside of the ivy-covered wall of the castle, round which a sentry is passing, and we are permitted to watch him clambering slowly up to the top, where ensues a terrific struggle between himself and the villain of the piece, ending, of course, in the headlong descent of the villain into the abyss below—when all this is "thrown in," with genuine dramatic interest to boot, any spectator who goes away dissatisfied must be very hard to please.

—The extracts from Busch's 'Bismarck' have hardly disappeared from the French papers when the first volume of the great Frederic's Political Correspondence comes to furnish copious new illustrations of the Prussian character. The Berlin correspondent of the Paris *Temps* sends that paper a batch of letters ranging from June 11, 1740, ten days after Frederic's accession, to October 25, the day on which he learned of the death of the Emperor Charles VI. The correspondent rightly describes them as "realism in politics," and finds in the *roi philosophe* the predecessor and model of "a statesman of our own time who had been supposed unique of his kind." To see things as they were, to dupe with their own illusions and fictions the rulers and ministers of rival nations, to prick contemptuously at the right moment the pretences which the rest of the world respected or feared, and all the while to pursue steadily the substantial ends of glory, power, and territorial aggrandizement—such was the policy already revealed in these letters of the wonderfully active summer of 1740. In the midst of these intrigues with France and Russia, and against England and Austria, the reader must recall Frederic's correspondence with Voltaire and first meeting with him by appointment; an episode, by the way, whose known dates do not agree as to place with those of some of these political letters. Almost all the contents of vol. i. are in French, to which the editors, Droysen, Duncker, and Sybel have only given a modern orthography. Frederic's duplicity (which was merely that of contemporary diplomacy) is especially apparent in his direct communications to Cardinal Fleury, whom he flatters outrageously while instructing Camas (Carlyle's "fat, sedate military gentleman of advanced years, full of observation, experience, and sound sense") to penetrate his designs, fill him with jealousy of England, "amuse" him with the notion of Frederic's lending himself to French ideas, "leave no stone unturned to cajole and win him over," study his expression as he reads Frederic's professions of devotion, "pay velvet words with velvet words, *and realities with other realities*," etc. His kingship was but ten days old when he thus commissioned his envoy extraordinary to France, Camas:

"The increase in my army which will take place during your stay at Versailles will give you occasion to speak of my quick and impetuous way of thinking. You can say there is reason to fear this increase may kindle a fire that will set all Europe ablaze, that it is characteristic of youth to be enterprising, and that heroic ideas trouble and have troubled the repose of an infinity of peoples in this world. You can further say that naturally I am fond of France, but that if I should be neglected it might be for ever and past repair, etc."

The fifteen years which the publication of this voluminous correspondence will cover will be enlivened by such excerpts, and it will not be Frederic's fault if his history be at the end "left chaotic, enigmatic in a good many points," the military part excepted, as Carlyle found it when he wrote his Life.

RECENT BOOKS ON RHETORIC.*

THE three treatises on rhetoric whose titles are given below do not confine themselves by any means to rhetoric strictly so called. Mr. Adams Hill states in his introduction that for the purposes of his book "Rhetoric may be defined as the art of efficient communication by language." The first part of his manual treats of composition in general, and under this head he begins with a chapter on grammar. The second part deals with "those principles which apply, exclusively or especially, to narrative or to argumentative composition—the two kinds of prose writing which seem to require separate treatment." Punctuation Mr. Hill would himself scarcely contend for as a branch of rhetoric; but he has given it a place in his appendix. Mr. David J. Hill's book is designed "as a practical introduction to English composition," and "to furnish a compendium of rules for guidance in the art of writing." He introduces chapters not only on punctuation and capitals, but one on criticism as well. Mr. De Mille points out that there is an important distinction between rhetoric and composition; the latter being "concerned with practical exercises by which the student acquires skill in writing"; the former embracing "that wide field of survey by which he makes himself familiar with the qualities of literature." In this treatise the author has endeavored "to consider everything that can properly be regarded as belonging to the province of rhetoric, and its contents embrace the subjects of style, method, the language of the emotions, and the general departments of literature."

We shall not attempt to criticise in detail the method pursued in these three books. Mr. De Mille's is the most elaborate and fullest. Mr. Adams Hill's is perhaps the most original in arrangement and treatment. They are all good and could be used with advantage by teachers—the object which seems to have been held in view by all three authors. But we shall venture to offer a few considerations regarding rhetoric which all readers of them will do well to bear in mind.

It should be observed at the outset that in no proper sense of the word can the acquirement of what may be called the mechanical use of language be considered as having any proper connection with rhetoric. Grammar and spelling, like the art of speaking itself, must be taken for granted before we arrive at the point where rhetoric begins; for rhetoric, as we understand it, is the art not, as Mr. Adams Hill would say, of "efficient communication" by language, but the art of employing language in the most efficient way to influence action or to convince the reason. It is not, in modern times at least, identical with the art of oratory, for it includes written language as one means of influence and of conviction. In ancient times rhetoricians' rules were framed and classified for the benefit of orators, because, before the invention of printing, the only way of affecting the minds of large numbers of people was speech. Every one, however, who has given any attention to the subject knows that the art of printing has had a most important effect on the art of rhetoric, and that it is no longer possible in considering the subject to confine ourselves to the art of oratory. There is another point also to be borne in mind which is often lost sight of, that the art of declamation, or the efficient use of the voice (with the aid of bodily movement and gesture), though it may be regarded as belonging to rhetoric in the old sense, is not a necessary part of it, for so long as written language is employed as a medium of persuasion, although the laws of rhetoric must be followed, the most delicate branch of the orator's art is not called into existence at all. If the whole world was suddenly to become dumb, the rules of rhetoric would have just the same meaning as they have now, but the arts of oratory and declamation would disappear.

In discussing the question of rhetoric in schools and colleges these distinctions, it seems to us, ought to be remembered. It is frequently said by those who think the art of declamation an important thing for young men to learn, that if you teach writing there can be no reason for not teaching speaking. But there is this difference between the two, that in writing, the object is chiefly the formation of a correct habit of expression, an exact habit of thought, and a pure style, and it is a peculiarity of writing that it does not require an audience to give reality and interest to the work. The mere acquisition of the power of expressing on paper thoughts definitely conceived by the mind is enough. With speaking it is entirely different. The whole object of speaking is the direct persuasion of an audience, and this cannot be learnt except in real debates. The recitation of speeches learnt out of a book to an audience which looks idly on, is not oratory. If it is anything at all it must be acting, which is a wholly different thing. If these premises are correct, the conclusion inevitably follows that declamation as taught in our schools and colleges is a waste of time, and even worse, for if it has any result it will be to produce a theatrical or affected manner. In France declamation is taught from an early age; but French oratory is always felt by Anglo-Saxons to be rather a spectacular display than a genuine and moving appeal to the audience. We do not mean by this that the art of speaking should not be made a subject of careful study for those who desire to excel in oratory. But it should be real speaking, not declamation. And we can see no reason why the debating societies of schools and colleges, which are a natural growth of the desire to learn how to speak, should not be assisted by the colleges in which they spring up to become real schools of debate, instead of being, as they are now, left entirely to themselves. But in all cases the wise words of Lord Bacon in his "Advancement of Learning" should be borne in mind:

> "Scholars in universities come too soon and too unripe [in his day, of course, young Englishmen went up to the universities as mere boys] to logic and rhetoric, arts fitter for graduates than children and novices; for these two rightly taken are the gravest of sciences, being the art of arts, the one for judgment, the other for ornament; and they be the rules and directions how to set forth and dispose matter, and therefore, for minds empty and unfraught with matter, and which have not gathered that which Cicero calls 'sylva' and 'supellex,' stuff and variety, to begin with those arts (as if one should learn to weigh, or to measure, or to paint the wind) doth work but this effect, that the wisdom of those arts, which is great and universal, is almost made contemptible, and is degenerated into childish sophistry and ridiculous affectation."

To put the thing in another way, oratory is the art of persuasion, and the study of this art has led to the use of all sorts of devices for the purpose of carrying the audience with the speaker. What these devices are and the names that have been given them it is, of course, perfectly easy to learn; but does any one suppose that the repetition of the speeches of other persons, real or imaginary, in which these devices have been successfully used (as in the familiar case of Antony's speech to the Romans over the dead Cæsar) will give any learner the slightest power of appeal or persuasion? If it taught him anything, it would teach him to imitate Antony's speech in the first street-row he saw going on—the consequences of which would probably convince him that he was not an orator. It is said that the habit of speaking even speeches learned by rote gives an ease and assurance that may be useful in after life; but this seems to us very doubtful. It is difficult to see how familiarity with the faces of an audience made up of school-fellows or classmates can possibly give a man much self-confidence in addressing a public audience when he knows he must win it to his side or lose his object.

The art of rhetoric differs from some others in having arrived long ago at perfection. The rules are the same to-day as they were in the days of Quinctilian or Demosthenes. The art, however, has now two distinct branches, writing and oratory. The multiplication of newspapers has made the art of persuading people by written language almost as important as that of persuading them by oral arguments; and there is this difference between the two, that the orator is at liberty to make a much greater use of appeals to the passions and emotions, while the writer's primary object is to reach the *mind* of his reader. Hence a great deal of the most effective writing has been of a very quiet order. The newspaper has one great advantage over all orators—its power of *iteration*, or repetition in new forms of the same arguments to the same persons. It also has an advantage of no mean order in being professedly a reporter of facts; for facts assume a wonderfully different value and importance from the manner in which they are reported or commented on. The reader of a newspaper goes to it for facts, but will insensibly be affected by the manner in which the facts are laid before him. From an orator facts are not expected.

To sum up what we have said, we see no reason why the study of rhetoric—that is, the analysis of the laws which govern the use of language for the purposes of moving the feelings or affecting the understanding—should not be considered a very important branch of education. It is not by any means true that a rhetorician's rules only enable him "to name his tools"; they enable him to understand the use of language as an art; provided he has a bent in that direction, the comprehension of them must be of great value to him; if he has none, he is a wiser and more educated man, and at one further remove from the savage, for understanding the nature of the machinery by which those primitive human

* 'The Elements of Rhetoric and Composition. A text-book for schools and colleges. By David J. Hill, A.M., Professor in the University at Lewisburg, and author of 'The Science of Rhetoric.'' New York: Sheldon & Co.

'The Elements of Rhetoric. By James de Mille, M.A.' New York: Harper & Bros. 1878.

'The Principles of Rhetoric, and their Application. By Adams S. Hill, Boylston Professor of Rhetoric and Oratory in Harvard College.' With an appendix, comprising general rules for punctuation. New York: Harper & Bros. 1878.

forces, the feelings, are called into play at the will of one who understands how to manage them. The art of using written language, also, so as to convey and enforce ideas, is of course a necessary part of a liberal education, and may be considered a proper rhetorical study. The study of declamation, however, or the art of repeating by rote the speech of other men, not to persuade or convince any one, but to come as near as possible to a representation of the probable manner of the person whose speech is delivered, does not seem calculated to train the speaker in the art of expression or persuasion, and is open to the serious objection that so far as it is successfully pursued the result will be likely to be purely theatrical.

John Lothrop Motley. A Memoir. By Oliver Wendell Holmes. (Boston: Houghton, Osgood & Co. 1879.)—Dr. Holmes has expanded the memorial of Mr. Motley which he prepared for the Massachusetts Historical Society into a handsome volume. "It is still but an outline," he says, "which may serve a present need and perhaps be of some assistance to a future biographer"; and more than once he remarks, in the course of the work, that the time is not yet come to publish Mr. Motley's correspondence in full, or even very copious extracts from it. He was a man so ardent in his feelings, and so frank and positive in the expression of them, that the printing of his entire correspondence may well, as his biographer says, "be in a future year and after it has passed into the hands of a younger generation." In these qualities, no doubt, is to be found the cause of the cruel blows that he received in his diplomatic career. We, whose feelings toward him are those of entire respect and confidence, may still understand how a man of his temperament might easily give offence to well-meaning statesmen who lived in the chilly political atmosphere, and under the artificial standard of public decency and morality, which prevailed at Washington.

Mr. Motley was born April 15, 1814, and died May 29, 1877 (the date of his death is nowhere given in the body of the work). He graduated at Harvard College in 1831; afterwards studied in Göttingen, and was for a short time Secretary of Legation at St. Petersburg. His first historical work, 'The Rise of the Dutch Republic,' was published in 1856; 'The History of the United Netherlands' in 1860 and 1868; 'The Life of John of Barneveld' in 1874. From 1861 to 1866 he was minister at the court of Vienna; in 1869 and 1870 at the court of St. James. This was a busy and varied life. In his early years Mr. Motley gave promise of literary brilliancy, although it would seem no especial promise in that particular field in which he afterwards gained distinction. "I did wonder," says Mr. Wendell Phillips, "at the diligence and painstaking, the drudgery, shown in his historical works. In early life he had no industry, not needing it. All he cared for in a book he caught quickly—the spirit of it, and all his mind needed or would use. This quickness of apprehension was marvellous." And, as all know, his first literary ventures were novels—historical novels, to be sure. It was not until 1845, in an essay upon Peter the Great in the *North American Review*, that his historical bent showed itself in a marked manner. When he decided to write history it was no chance, neither was it any conscious seeking, that led him to his subject. "I had not," he says, "first made up my mind to write a history, and then cast about to take up a subject. My subject had taken me up, drawn me on, and absorbed me into itself." Naturally enough, learning that Mr. Prescott was at that time contemplating his history of Philip II., he feared that his project might seem to come into collision with that of the distinguished historian; he sought an interview with him, therefore, and laid his plans before him. Mr. Prescott met him in the most cordial and generous spirit. When he spoke of the danger there might be of the crossing of their paths, with its probable ruin of his own enterprise, "I recollect how kindly and warmly he combated this opinion, assuring me that no two books, as he said, ever injured each other, and encouraging me in the warmest and most earnest manner to proceed on the course I had marked out for myself. Had the result of that interview been different—had he distinctly stated, or even vaguely hinted, that it would be as well if I should select some other topic, or had he only sprinkled me with the cold water of conventional and commonplace encouragement—I should have gone from him with a chill upon my mind, and, no doubt, have laid down the pen at once, for, as I have already said, it was not that I cared about writing a history, but that I felt an inevitable impulse to write *one particular history*" (p. 64). The testimony of another coworker of Mr. Motley, the Dutch archivist Groen van Prinsterer, will be found interesting. Mr. Motley called upon him August 8, 1853, at the Hague, having been previously announced by a letter from a friend. "How shall I picture my surprise," writes the archivist, "in presently discovering that this unknown and indefatigable fellow-worker has really read—I say read and reread—our *Quartos*, our *Folios*, the enormous volumes of Bor, of Van Meteren, besides a multitude of books, of pamphlets, and even of unedited documents. . . . Not only is he acquainted with my Archives, but it seems as if there was nothing in this voluminous collection of which he was ignorant" (p. 144).

In spite of the delicate relations touched upon by his correspondence during his residence at Vienna, Dr. Holmes has succeeded in selecting some graphic passages which he could insert. He writes February 26, 1862:

"I say, then, that one great danger comes from the chance of foreign interference. What will prevent that? Our utterly defeating the Confederates in some *great* and *conclusive* battle; or, our possession of the cotton ports, and opening them to European trade; or, a *most unequivocal policy* of slave emancipation. Any one of these three conditions would stave off recognition by foreign powers until we had ourselves abandoned the attempt to reduce the South to obedience. The last measure is, to my mind, the most important. The South has, by going to war with the United States Government, *thrust into our hands against our will* the invincible weapon which constitutional reasons had hitherto forbidden us to employ. At the same time it has given us the power to remedy a great wrong to four millions of the human race, in which we had hitherto been obliged to acquiesce. We are threatened with national annihilation, and defied to use the only means of national preservation" (p. 113).

September 22, 1863, he wrote:

"At last when that little concentrated telegram came announcing Vicksburg and Gettysburg on the same day and in two lines, I found myself almost alone. . . . There was nobody in the house to join in my huzzas but my youngest infant. And my conduct very much resembled that of the excellent Philip II. when he heard of the fall of Antwerp, for I went to her door, screeching through the keyhole 'Vicksburg is ours!' just as that other *père de famille*, more potent but I trust not more respectable than I, conveyed the news to his Infanta" (p. 123).

And this is the man whom McCracken called an "un-American functionary."

Wanderings in South America, the Northwest of the United States, and the Antilles, in the years 1812, 1816, 1820, and 1824. By Charles Waterton. New edition. Edited, with biographical introduction and explanatory index, by the Rev. J. G. Wood. With 100 Illustrations. (London and New York: Macmillan & Co. 1879.)—The republication of Waterton's 'Wanderings,' pure and simple, would perhaps not have been prudent as a commercial venture. Apart, therefore, from the value of his own contributions to the present volume, Mr. Wood is sure of the gratitude of those for whom this classic book of travel has a permanent charm, and who would gladly see its life indefinitely prolonged. The pictorial explanatory index finds a ready apology in the fact that Waterton disdained the scientific nomenclature, so that the vegetable and animal species to which he alludes by their local names often cannot be identified without help. The biographical introduction, on the other hand, is open to the objection of doing less fully what has been done before, of relating little that is new except about the editor's acquaintance with the naturalist, and of making insufficient mention of the work beside which Mr. Wood's biographical sketch seems almost or quite superfluous. From the manner in which (p. 6) Mr. Norman Moore's edition of the 'Essays on Natural History' is spoken of, the inference would naturally be that it was worth consulting only or chiefly in regard to Waterton's school experiences at Tudhoe; while the sentence on p. 81—"It is much to be regretted that he would never sit for his portrait"—implies a suppression of Waterton's own statement that he "did sit for the late Mr. Peale, of Philadelphia," and of the fact that an engraving after this portrait forms the frontispiece of Moore's edition above mentioned. Mr. Wood might even be reproached with a certain disingenuousness in offering as novel his crude drawings of the nut-tree lifting the millstone, of Walton Hall, and the Grotto, all of which are to be found represented more skilfully in Moore.

The charm of Waterton's narrative lies partly in its style, so unlike that of the traveller or explorer of to-day; and partly in its revelations of a very rare and lovable character—modest, tender, absolutely fearless, uncompromisingly loyal to truth and to his own convictions. Who can resist the beauty of such a passage as this?

"Heedless and bankrupt in all curiosity must he be who can journey on without stopping to take a view of the towering Mora. Its topmost branch, when naked with age or dried by accident, is the favorite resort of the Toucan. Many a time has this singular bird felt the shot faintly strike him from the gun of the fowler beneath, and owed his life to the distance betwixt them."

That is all the information vouchsafed as to the height of the mora, but the idea conveyed by it so poetically is more forcible than the tape-measure explanation of the index. Waterton wrote not for naturalists but for the public, and suppressed details with the arbitrariness and also with the discrimination of an artist. Instead of the modern diary, in which each station and almost each meal are accounted for, he gives us a delightfully or provokingly vague itinerary, as for instance :

"The Indian place you are now at is not the proper place to have come to in order to reach the Portuguese frontiers. You have advanced too much to the westward. But there was no alternative. The ground betwixt you and another small settlement (which was the right place to have gone to) was overflowed ; and thus, instead of proceeding southward, you were obliged to wind along the foot of the western hills, quite out of the way."

Waterton's fourth journey landed him first in New York, in 1824, a date when a visit to Niagara was synonymous with a trip to "the Northwest of the United States." Never was English tourist more magnanimous toward us. The classical names which disfigure the map of New York seemed to him "a pretty thought," for did not Utica remind him irresistibly of Cato ? "Our western brother . . . . has certainly hit upon the way (but I could not make out by what means) of speaking a much purer English language than that which is in general spoken on the parent soil." He admired the gentleness of the Broadway throng, and remarked the scarcity of dogs, cats, and fat women. "Words can hardly do justice to the unaffected ease and elegance of the American ladies" whom one meets at the falls of Niagara. "From the shores of the Atlantic an immense column of knowledge has rolled into the interior. . . . It now seems as if it were advancing toward the stony (*sic*) mountains ; and probably will not become stationary till it reaches the Pacific Ocean." He concludes his praise of the republic with the prayer that it may never be divided by intestine feuds.

One peculiar distinction of Waterton's is not brought out in his 'Wanderings.' He personified that reconciliation of science and theology which is still the object of so much pious endeavor. He repeats certain stories of a nation of Indians with long tails, and a canoe-devouring river-monster, and pronounces them "ludicrous extravagances ; pleasing to those fond of the marvellous, and excellent matter for a distempered brain." At the same time, as a good Catholic, he believed in winking Madonnas, the miraculous liquefaction of a saint's blood, the miraculous removal of the Virgin Mary's house from Nazareth to Loretto, and the like. From the Protestant point of view it would be interesting to enquire why this intellectual dualism or dimorphism is more respectable than Hugh Miller's juggling with the first chapter of Genesis.

Washington Irving. By David J. Hill. (New York : Sheldon & Co. 1879.)—The most striking feature in Irving's career is its felicity. His genius was of a simple order, but he fell in with the experience best fitted to cultivate it, and the social conditions most opportune for its immediate and widespread recognition. He was in a true sense popular, dear to the people ; he won their hearts by describing the old home, the places and customs for which the freed colonies still retained a lingering attachment, before the traditions and mental habits of a province gave way in a new generation to the consciousness of separate and independent nationality, and still more, perhaps, by revealing the imaginative historic interest in their own familiar fields and mountains with which he also blended a legendary charm. He touched them, too, through national pride ; the young and ambitious country hailed eagerly one who had won for the republic literary glory, which even to the vulgar mind is the noblest ornament of a state. After years of absence he returned with a fame as well established abroad as at home, with the medal of the king and the diploma of the university, a historian as well as a story-teller, and his countrymen, who might not have been satisfied that the stamp of their own criticism assured the genuineness of the coin, received him with such a welcome as has seldom been extended to any citizen, and cherished him with an affection only less, so it is asserted by men of that time, than the love they felt for Washington. They had produced writers in many fields, but he was their first man of letters. This civic pride counted for much in his popularity, and since it passed away in a great measure as it became clear that we were not an unlettered people, one support of his extraordinary reputation fell with it. The lingering tradition of his contemporary fame, transmitted from father to son, wil remain somewhat longer, but essentially he stands now upon the merit of his own actual performance, and his name continues to be a password into every critical camp.

His aim, he said, was to put the world into good humor with itself ; and he succeeded at least in putting it into good humor with him. He is a companionable friend; that is a good deal, but he is not much more than that. He has no counsel to give, he reveals no truth, he has not influenced the conduct or the thought of the world. He put aside moralizing and reflection in his books as he exiled political interests from his life ; he sought only to delight his readers ; he was an artist for art's sake before the phrase had become the cant of an unprincipled school ; at last he told a pleasant tale by nearly every English fireside, usually neither very witty nor very gay, but always kindly, and he went away leaving grateful remembrances behind. The artistic sense, indicated by his content with simply securing delight, was strong in him ; it ordered and arranged his work, grouped his figures, suffused his ideas with the light and shadow of harmonizing fancies, moods, and images, gave him that power of stroke and sureness in detail which make his delineation of natural objects kin with pictorial art, and was the secret of that justness in literary form which, a survival from Goldsmith and Addison, is worthy of such companionship, and is, indeed, what alone makes his work permanent. Form, however, will sometimes preserve what has no other merit ; and there is fear that one who examines the contents of Irving's work, its intrinsic value, will feel Carlyle's sneer rising to his lips about "the pretty-story-telling Sir Walter Scott."

The biography of such a man throws but little light upon his work. In this book he is seen as the peaceful, lovable, large-hearted man he was, leading a calm life amid troops of friends and "descending the mossy track to age." It contains, we believe, no new material, but is compiled from easily-accessible sources, like Irving's 'Life and Letters,' essays, published reminiscences, and literary encyclopædias. It is, on the whole, a depressing book, because it is the first of a series upon American authors similar to that called 'English Men of Letters,' and it is impossible to avoid comparison. The events of an uneventful life are here collected with industry and assigned their proper places, and some of the critical remarks are just ; but an idea of Irving is not to be got by reading how much he was paid for each book, or what the English magazines said about him. To make an author live again some imagination is needful, and the absence of that quality is the fatal lack of this volume.

FANNY KEMBLE'S

Records of a Girlhood.

Large 12mo, with Portrait, $2 50.

"A production of unquestionable spirit and importance. . . . Of unflagging interest. All [the anecdotes] are freshly and smartly told, and they constitute a kind of treasury of literary and social gossip."—*Evening Post.*

"The book is so charming, so entertaining, so stamped with the impress of a strong, remarkable, various nature, that we feel almost tormented in being treated to a view only of the youthful phases of the character. Like most of the novels that we read, or don't read, this volume is the history of a young lady's entrance into life. Mrs. Kemble's young lady is a very brilliant and charming one, and our only complaint is that we part company with her too soon."—*Nation.*

TWO GOOD NOVELS.

16mo (Leisure-Hour Series), $1 each.

Hardy's Return of the Native.
Fothergill's The First Violin.

HENRY HOLT & CO., NEW YORK.

The Emerson Steel Portrait.

"The portrait [by Rowse, in crayon ; considered the best portrait of Emerson in his prime] is a remarkable likeness, and happily renders the sweetness and serenity of expression which are characteristic of Mr. Emerson. Mr. Schoff's engraving reproduces all the essential qualities of expression and treatment in the original with surprising fidelity. It is a sympathetic, and not a merely mechanical, piece of work ; and it evinces a power of drawing, and a feeling for subtle qualities of form and light and shade, which are most rare among modern engravers. The quality of the well-defined yet softly-melting edge in the contours of the face seems really wonderful, and the sureness and economy of line and touch by which the total result is reached entitle the work to rank among very uncommon achievements."—*The Nation, January 2, 1879.*

"I think the work one of very remarkable excellence. I have seen no recent piece of portraiture so good, and I believe the engraving will hold place among the best-engraved portraits."—*Professor Charles E. Norton.*

Proof-impressions of the Engraving (price $10) may be obtained direct from the engraver, Mr. S. A. SCHOFF, Newtonville, Mass., or may be ordered through any dealer in prints in the United States.

My Annual Catalogue

Of VEGETABLE AND FLOWER SEED FOR 1879, rich in engravings, from original photographs, will be sent FREE to all who apply. Customers of last season need not write for it. I offer one of the largest collections of vegetable seed ever sent out by any seed house in America, a large portion of which were grown on my six seed farms. Printed directions for cultivation on each package. All seed warranted to be both fresh and true to name ; so far that, should it prove otherwise, I will refill the order gratis. The original introducer of the Hubbard Squash, Phinney's Melon, Marblehead Cabbages, Mexican Corn, and scores of other vegetables. I invite the patronage of all who are anxious to have their seed directly from the grower, fresh, true, and of the very best strain. NEW VEGETABLES A SPECIALTY.

JAMES J. H. GREGORY,
Marblehead, Mass.

DAVID G. FRANCIS, 17 *Astor Place, New* York, Dealer in Valuable Second-hand Books, has always on Sale 25,000 volumes or more of Ancient and Modern Books in various departments of Literature, for Public and Private Libraries.

PRICED and DESCRIPTIVE CATALOGUES of portions of the Stock are issued from time to time, and will be forwarded to book-buyers *free of postage.*

Orders for any obtainable books, American or foreign, promptly filled at the lowest prices.

The Nation.

NEW YORK, THURSDAY, FEBRUARY 27, 1879.

The Week.

THERE has been a good deal of what the reporters call "antagonizing" in Congress—that is, offsetting one measure proposed to be taken up with another. The order of business arrived at in this fashion is about as follows: The Senate has passed the Post-Office Appropriation Bill after a prolonged struggle over the Roach subsidy, and the Army Appropriation Bill after summary rejection of the most important sections agreed to by the House, and an interesting debate on a section of its own relating to the conversion of railroads into telegraph companies. Neither Mr. Beck, with his point of order that the Brazilian subsidy was not germane to the bill; nor Mr. Edmunds with his, that it was new legislation and therefore contrary to Senate rule No. 29, was sustained; nor were amendments limiting the term to five instead of ten years, and reducing the rate to $10 a mile instead of $30, and making the service alternate between New York and Baltimore, successful. The bill passed by 25 to 15. From the Army Bill was struck all that related to reorganization, and the section prohibiting the use of Federal troops at elections. Authority was given railroad companies which *have* telegraph lines (not which may construct them—that was voted down by 35 to 26) to transmit messages for the Government and the public at rates to be fixed by the former. The opponents of this hasty and irrelevant legislation succeeded in imposing the condition that the roads should first file a written acceptance of the restrictions and obligations to which telegraph companies are subjected by statute; but the Constitutional question raised by Mr. Conkling's amendment requiring that a road should first obtain the right of telegraphic service from the State which chartered it, was decided by rejecting this requirement. The final vote on the section was close—31 to 28. Its special champion was Senator Jones, of Florida.

The House has been engaged on the Legislative Appropriation Bill, and the statute regulating the Southern jurors' test-oath was abolished on Wednesday week, though opposed as new legislation. The Republicans made a more determined stand against the section repealing the law providing for supervisors of elections, under which numerous convictions, North and South, have been and are being daily made; and Mr. Garfield caused an ingenuous excitement among the majority by declaring that they were rather servilely obeying the dictates of a party caucus; a just rebuke, by the way, but Republican servility to caucuses is not altogether unknown. The Democrats made a great point of the economy contemplated—actually $200,000, with the Arrears of Pensions liabilities fresh in mind. Butler doubtless spoke the truth when he said that New York, and not the South, was the prize in view, with reference to the next Presidential election. The Republicans were unable to carry out their intention to filibuster, and the section was repealed over their heads, and the bill passed, on Tuesday. In the intervals of the debate the House was robbed of valuable time in order to listen to Mr. Ewing's reasons for taking up and passing the Anti-Resumption Bill with the Senate's amendments. But it showed its sense of chronology if not of humor, for it killed the measure again by 141 to 10. An effort to table the Anti-Chinese Bill failed, 140 nays to 95 yeas; and the bill passed with the Senate's amendments. Passage over a veto appears to be impossible. On Monday a committee of conference was ordered on the Internal Revenue Bill, and the Sundry Civil Appropriation Bill was passed under a suspension of the rules by 181 to 79.

The rapid passage through both Houses of Congress of a measure to confer upon railroad companies in the several States powers in respect of the use of the telegraph which presumably they do not now possess—being in effect an amendment of their respective charters—is one of those not unfrequent surprises which illustrate either the great recklessness on the part of Congress or very sudden changes of opinion among legislators and political parties. The question whether Congress can grant or enlarge or curtail the powers of State corporations has been under discussion more or less since the beginning of the Government, and at times has given rise to very warm controversy. It was debated at great length in 1863, on the bill to authorize the Delaware and Raritan Bay Railroad, of New Jersey, to carry freight and passengers between New York and Philadelphia, the bill being finally rejected by the Senate. It was discussed incidentally but with much carefulness on the clauses of the Pacific Railroad Bill which related to the Kansas and Central Pacific divisions, whose lines ran partly through States; and the determination of Congress to assume no doubtful powers in the matter was the very circumstance which led to fixing the eastern terminus of the main line within the Territory of Nebraska instead of in the State of Kansas. Now the whole question is disposed of in one day by the House, and in a few hours by the Senate, on an amendment to the Army Appropriation Bill, not germane to the bill itself, but as far as possible foreign to any military subject whatever. And what is still more surprising is the fact that this weighty change in public policy has been accomplished by an overwhelming majority of the Democratic votes in Congress, that party priding itself on having had its origin in resistance to Federal encroachment upon State rights, and having hitherto fought against such encroachments with the utmost tenacity and bitterness.

The Geneva Award Bill passed by the House has been considered by the Senate Judiciary Committee, and a substitute reported to the Senate. It provides for a revival of the Court of Commissioners of *Alabama* Claims, repealing, however, the provision of the law relating to the old court which excluded insurance claims unless the companies could show that their losses during the war exceeded their premiums, and admitting all insurance claims as claims "of the first class"; directs the court to consider and allow "all properly proved claims not included in the first class directly resulting from damage done on the high seas by Confederate cruisers during the late rebellion, including vessels and cargoes attacked and taken on the high seas, or pursued by them therefrom, although the loss or damage occurred within three miles of the shore, and whether such claims be made by the original property-owner, or by an underwriter who paid for such loss or damage, which claims shall be considered as claims of the second class"; orders judgments of claims of the first class to be paid first, and that other judgments, if there is not money enough for all, shall be paid ratably. As it is notorious that the Geneva Award Fund is larger than all the legitimate claims upon it, the practical result of this bill, if passed, would be that the insurers would be paid in full, and that the balance of the money would probably be divided among the other claimants, who have not, as a matter of right, a shadow of claim to it. If, however, after paying the legitimate claims the Government chooses to *give away* the remainder of the money to the classes somewhat vaguely described in the bill, there is certainly no reason why it should not be done, except that the money belongs, properly speaking, to England. But England is not likely to make any demand for it, and her demand, if she made one, particularly after the Halifax Award, would hardly be listened to at Washington with much attention.

In the first session of the Forty-fourth Congress an examination was made by a House Committee into the administration of ex-Secretary Robeson, and a majority report presented to the House containing specifications of fraudulent actions and extravagant expenditures on the part of the late head of the Navy Department.

The minority disagreed with these conclusions, and presented a contrary report. A resolution subsequently introduced by the majority, and adopted, referred the whole matter to the Judiciary Committee with instructions to report articles of impeachment against Mr. Robeson if they found ground for so doing, or other necessary legislation. The Judiciary Committee decided that no fraud or wilful violation of law was shown, and took no further action. The next step was an investigation by the Committee on Naval Affairs in the present Congress, covering the same ground as the committee of the last Congress, and followed by a majority report containing the same accusations made by the former committee, with some additional ones. A summary of the minority report of this committee appeared in Monday's despatches, and is another attempt to exonerate Mr. Robeson by general denials of the facts brought forward by the majority, and by ignoring some of their most important accusations.

It was alleged, for instance, that although during Robeson's administration there was appropriated for the Department the enormous sum of $182,409,033, the Navy only possessed forty-three vessels fit for service. The minority report replies that so much of the one hundred and eighty-two millions went for other purposes that little was left for building ships, which is the very kernel of the charge. Notwithstanding the large appropriations and the sums derived from the sale of old material, there existed at the close of Robeson's administration an indebtedness of over seven millions of dollars for which there was no authority of law. The minority do not explain how, with such great sums at its disposal, the Department was obliged to run into debt, nor is the illegality of the proceeding considered, nor are any reasons suggested for the poor condition of the Navy. There is no refutation, either, of the definite accusations in regard to the illegal disposal of Government property to favorites at ruinous rates, or of the advances paid to contractors for work not done, or of the making of contracts and involving the Government in expenditures for which no appropriations had been made. Still, it must be allowed that a minority exculpation is, as reports go, just as good as a majority inculpation, if the latter is not followed by any action; and that Mr. Robeson may, therefore, now be looked upon, according to the taste and pleasure of the observer, as an innocent victim of the malignant fury of partisan persecution, or as a new instance of what Mr. Charles O'Conor and other disgusted reformers would call "peculation triumphant."

General Barlow's experience of the results of trying to "see a fair count" down in Florida is very ludicrous, or would be if it were not likely to give him and his friends some annoyance. The elder Chandler gave what we may call the keynote of the count to all the workers on the second day after the election, before the returns were in, by a telegraphic announcement that Hayes was elected without any manner of doubt. This was, of course, fair notice to the counters in the doubtful States as to what was expected of them, or rather as to what the result of "a fair count" was to be. The despatch of "Visiting Statesmen" to the disturbed districts by General Grant in no way changed this impression, as they all belonged to the same political party, and all except General Barlow were either office-holders or office-seekers. General Barlow seems to have been the only simple-minded one of the lot, for he undoubtedly went under the influence of the idea propounded in one of General Grant's letters, and held by the best Republicans, that the Republicans were bound to see that no stain should rest on their candidate's title if he got the place, and bound, too, to see that he did not get it unless clearly entitled to it. The duty of a Republican "Visiting Statesman" under this theory was plain enough. He was to urge all that could fairly be urged on behalf of Hayes, but see to it also that Hayes got nothing which Tilden might rightfully claim. But the Chandlers, Bradys, and the rest took no such ethereal view of the situation. Their simple duty—as they saw it—was to take care that their man was elected, and seeing a fair count was, as Brady described it before the Potter Committee, urging the Returning Board to give the Presidency to the good man, and assuring them that "the Republican party of the United States would stand by them."

General Barlow seems not to have understood all this, and besides presenting the Republican case in instances where he thought it was sound, foolishly laid down rules for the government of the Board which in other instances would be sure to tell against it, and even went so far as to counsel some of them privately to throw out votes which the Republicans needed. This "advising contrary to our interests," as Brady called it, was "treachery" in their eyes, and was not "seeing a fair count" at all. Accordingly they have got together before the Potter Committee, and accused him of having been their "counsel," though without pay, and having committed treason against them—by advising the Board not to give them certain votes. Mr. William E. Chandler made this charge before the Committee with his accustomed brass, and it was called by one of the Republican members of the Committee, very appropriately, "improving the occasion." The idea of giving testimony in any political matter, for any other purpose than "improving the occasion," is something which probably never entered Chandler's head. We presume the occurrence will be a warning to General Barlow to be more particular about the company he keeps. Going to "see a fair count" with such moralists as Chandler was very like opening a faro-bank with John Morrissey for the benefit of the Home Missionary Society.

The plan of avoiding the payment of municipal debts invented by the city of Memphis has received, it is to be hoped, a lasting check by the recent decision of Judge Baxter, of the United States Circuit Court, by which the Act of the Legislature depriving the city of its charter is declared invalid and a receiver appointed. The judge replied to objections by a plain statement of the case. The State of Tennessee created a municipal corporation, and that corporation created debts and acquired assets. The Legislature abolished the corporation and appropriated to the State its assets. This act impairs the obligation of contracts, and is a violation of the Constitution both of the State and of the United States. Of course the decision has been ill-received where it applies, and the Memphis *Appeal* remarks that "perhaps in a few days even Judge Baxter may realize that there is a State of Tennessee, whose orders are superior to his, and whose sovereignty is beyond his despoiling touch." This is unhappily true of the State's fidelity to its own obligations. The proposition of Tennessee bondholders to compromise their claims by accepting new six per cent. bonds for sixty per cent. of the face-value of the old bonds and accrued interest, or new four per cent. bonds at par and accrued interest, has been reported on adversely by the legislative committee on finance. The report, which was accepted by the State Senate, recommends that the proposition be not farther considered by the present Legislature. A resolution to compromise the debt at fifty cents on the dollar, with four per cent. interest, was tabled by a large vote. Such obstinate repudiation by a people whose State tax is only one-tenth of one per cent. may well have its comic side. A clergyman in Nashville, who preached against it and pointed out with great moderation the dishonor and the folly of it, was censured by a vote of the Legislature; but this was afterwards rescinded.

The celebration of the anniversary of the foundation of the Johns Hopkins University at Baltimore on the 22d was marked by an address by President White, of Cornell, who dwelt at considerable length on the crying need of political training and education in public bodies. Having been four years a member of the Senate of this State, he speaks from experience, and the picture he draws of the business of legislation as he saw it at Albany is not an encouraging one. He says that he has "seen laws for the repression of crime discussed with an utterly inadequate knowledge of principles that in some other lands have been carefully settled"; in questions relating to the taxation of four millions of people he has "seen the settled experience and simplest reasonings and conclusions of

thoughtful men in various nations pass for nothing"; in regard to pauperism he has "seen means taken similar to those which in England, over three hundred years ago, began the creation of a permanently pauperized class." He has "seen codes made and millions voted with no real discussion," and has "seen the relations of education to industry, the problem now occupying every other great nation of the earth, argued with far less care than the location of a canal bridge." This, we think, will be recognized as not an unfair picture of much of the legislation which goes on at Albany. The important question is, What is the root of the difficulty, and how can it be reached? Mr. White declares that he is convinced that it lies in the want of training among political leaders in "political and social science." This he thinks colleges can supply by insisting on close study of the "political and social history" of the leading nations of the world; political economy; social science, so called, including the best theories and plans for the amelioration of human conditions; the "general principles of jurisprudence," and of international law.

Few people will differ from Mr. White in thinking that these subjects, or at least most of them, ought to be taught by colleges; but it is a curious suggestion for Mr. White, of all people, to make, that any instruction in them, however thorough, will have any direct effect in producing a class of educated political leaders. After Mr. White has caught his young men and instilled all this useful knowledge into them, and qualified them to be wise and thoughtful statesmen, two very important questions will always remain to be disposed of: Whether politics is a sufficiently attractive career to induce them to enter it, and whether, if they wish to do so, their acquirements will be of any use to them in securing an admittance? With regard to the first, the attractiveness of politics may be largely a matter of taste; with regard to the second, we can imagine no more serious obstacle to a man's successful entrance into politics in this State than a careful preparation in political economy, law, and social science. If he is a Republican, what he needs to understand is the exact relations of the Administration to the Custom-house; what will advance him in power and influence is an accurate knowledge of the secret prejudices, friendships, social political relations and ambitions of half a dozen Custom-house politicians, combined with the capacity to use them; if he is a Democrat, the subject he must make himself a master of is, not jurisprudence or comparative legislation, but the organization of the General Committee of Tammany Hall. These are subjects, too, of great intricacy, which only years of patient effort can make a young man at home in. Mr. White gave his own students far better advice, if we remember right, a year or two since, in holding up to them as a model Mr. Conkling, and advising them to emulate him.

The sales of U. S. 4 per cent. bonds have been sufficient during the week to enable the Treasury to notify the holders of $20,000,000 more U. S. 5-20s of 1867 that they will be redeemed ninety days hence. This makes $250,000,000 of 6 per cents replaced with 4 per cents since the beginning of the year. The buying of the 4 per cent. bonds at the commercial centres has fallen off, and purchases come mostly from the country. At the Stock Exchange the week was marked by great speculative activity, and the prices of stocks fell from ½ to 9 per cent. Money in London continued easy at about 3 per cent. Here the rate advanced spasmodically, but did not rule above 3 per cent., although the reserve of the New York banks has been steadily falling in the last three weeks on account of payments into the Treasury for bonds taken. The net reserve is down to $9,212,650, against $13,633,750 a year ago. Sterling exchange ruled below the specie-exporting point. Silver in London early in the week advanced to 50¼*d.* per ounce, but fell to 49¾*d.* at the close, when the bullion value of the 412½-grain silver dollar was $0.8391.

A significant stand has been made by the Reichstag against the Government's pretensions to arrest its members. The occasion was a request on the part of the Prefecture of Police that the Reichstag would sanction the arrest and prosecution of the well-known Socialists, Fritzsche and Hasselmann. Herr Lasker declared that the anti-Socialist law was never intended to cover this class of prosecutions; that it was the duty of the two inculpated deputies to obey the Emperor's summons to the meeting of the Reichstag; and that it was a waste of time to ask the latter for consent to legal obstructions to the fulfilment of this duty. A resolution to this effect was adopted by a large majority, and the Reichstag's consent to the proposed arrests refused. The commercial treaty between Austria and Germany has been approved. In the course of the debate on it Bismarck renewed his protectionist profession of faith, and, while admitting that he had changed his views, expressed his determination to stick firmly to his present convictions. The newspapers are plied with addresses, chiefly from agriculturists, approving Bismarck's position; and the National Liberals, who are divided on the question of the tariff, dread the effect of a dissolution on their existence as a party. The new Administration in France has been receiving deputations of shipowners asking for discrimination of duties in behalf of the flag and of home manufacturers, complaining that the lowering of wages in England caused a like lowering in France. Both President Grévy and Minister Lepère replied that the Government was open to conviction. The reason for this revival of protectionist ideas, not only in the countries just named but also in England, we shall discuss at an early day.

The results of the last French census, taken in 1876, have been published, by which it appears that the population is increasing very slowly. On December 31, 1876, the number of inhabitants was 36,905,788. In the month of May, 1872, when the last preceding census was taken, the number was 36,102,921. The increase during this period has therefore been only 802,867, which corresponds to an annual gain of 0.49 per 100. It must also be borne in mind that this increase of 802,867 is not entirely due to the normal growth of population resulting from an excess of births over deaths. By this means the gain would only have been 601,287. For since the census of 1872, 201,580 persons, both French and foreign, many of whom were from Alsace and Lorraine, emigrated or returned to France. Notwithstanding the gains in population during the last few years, the census of 1876 is not as large as that of 1861, which shows that during the intervening fifteen years there was a positive falling off of population, largely caused, of course, by the loss of Alsace and Lorraine. In the rural districts the excess of the birth over the death rate is two per cent.; in the cities it is one per cent. But a continual emigration from the country into the towns has afforded the latter considerable growth. The census tells us that almost nineteen million persons live by agricultural pursuits, and almost four million by commerce; the arts and trades support over six million, manufactures over three million, while there are one million and a half in professions, which include the police. Of persons who live exclusively on their revenues there are more than two millions. The army is not included in any of these figures.

There has been an émeute at Cairo growing out of the economic reduction of the army, which might have been borne by the disbanded officers if they could have got their back pay. The mob surrounded the palaces of the Premier, Nubar Pasha, and the Minister of Finance, Mr. Rivers Wilson, and hustled both of them as they came out, and paid so little regard to the Khédive's personal remonstrances that an exchange of shots ensued with his body-guard. Nubar Pasha was wounded in the hand, and the Khédive himself had a narrow escape. Still, it is suspected that a *coup d'état* was contemplated, as the Khédive insisted on the retirement of Nubar Pasha and a reorganization of the Cabinet to suit himself. This led at first to the resignation of Mr. Rivers Wilson also, but with the help of the Powers a compromise was effected by which the English financier remains, and the Khédive becomes President of the Council. The Minister of War has resigned.

LEGISLATIVE COERCION.

CONGRESS is apparently approaching a deadlock, or rather a pair of deadlocks, growing out of the attempted coercion of the Senate by the House and of the House by the Senate, by means of amendments attached to the regular appropriation bills. The House has incorporated into the Army Appropriation Bill a measure for reorganizing the Army generally, and also provisions for amending the Federal election law, and for enabling railroad companies to become telegraph companies. The Senate, on the other hand, has added to the Post-Office Appropriation Bill a ten years' subsidy to a steamship line, having for this purpose reversed one of its own standing rules; and while it has cast out two of the interpolations of the House from the Army Bill, it has inconsistently accepted the third. The House is expected to expunge the John Roach subsidy from the Post-Office Bill, but to stand bravely by its own parasites on the Army Bill. Crimination and recrimination are freely indulged in. Private interests and partisan animosity are stoutly arrayed in attempts at legislative coercion, and it is not impossible that one or more of the necessary bills for carrying on the Government during the next fiscal year may fail by reason of the refusal of one or the other house to give its assent to measures of general public policy which it does not approve of. It is to be hoped, indeed, that each, however bent upon coercing the other, may refuse to be itself coerced, and that the battle for legislative responsibility and independence may be fought out to a conclusion at the expense of any appropriation, however needful.

It is not very long since the introduction of Mexican methods into the American system of government was the leading topic of discussion and conversation. When the question of the disputed Presidency was uppermost, and later when the Potter Committee began to be talked of, the public was edified by a most elaborate setting forth of the superiority of regular and legal methods of settling all controversies over the irregular and summary forms of procedure prevailing in the Spanish-American republics, and known under the generic name of *pronunciamiento*. The idea of the *pronunciamiento* in all cases is that *our* side, or, as it often happens, *my* side, of the controversy in hand is absolutely right, and that whatever stands in its way, whether a popular majority or a legal principle or a religious scruple or a constitutional provision, must be put down instantly by force. It sometimes produces enough bloodshed to be called a revolution, but usually takes the form of bushwhacking, stage-robbing, church-burning, and street-brawls. It is the pestilent enemy of civilization in the countries south of us, and it is a mere truism to say that no progress toward the accumulation of wealth and social amelioration can be made there until the *pronunciamiento* as a mode of settling differences of opinion is completely stifled and got rid of. The example of Mexico was put to a good use when it was held up as an awful warning to the American people not to resort to arms while any peaceful means of adjusting the dispute over the Presidency remained untried.

The practice, not now attempted for the first time, of coercing one branch of the legislature to pass a measure which it does not approve, under penalty of stopping the wheels of government, is essentially Mexican in character and intent, and ought to be resisted in every case to the last extremity. It bears no analogy to the precedents of English history in which the House of Commons withheld grants of money from tyrant kings supported by obsequious Lords. The struggle for liberty of the people has long ceased in both countries. There is no question raised, or possible to be raised, of the subversion of free institutions among us. It was expressly to put that class of questions out of the category of politics that both the legislative and executive powers in the new republic were made to depend upon frequent elections, and that the right of voting was confined to no class. The struggles of the House of Commons were struggles against a fixed element in the constitution and government of England—against evils which could not have existed but for the feature of permanence which hedged the crown. That feature does not exist here; it was ruled out as a matter of course when independence was secured. The necessity of curtailing the king's power to do harm by putting him on short allowance was never felt on this side of the water, because the executive himself might be constitutionally put out of the way within the space of four years, or sooner by impeachment. Still less has there ever been need that one branch of Congress should throttle the other, and demand the passage of a law under penalty of starving it and everybody else into submission. The House says virtually that unless a new and particular method of grouping officers and enlisted men together shall be adopted the Army shall be disbanded altogether. The Senate says that unless a ten years' contract shall be made with a certain shipbuilder to carry the mails to Brazil, without a scrap of evidence that any public money is needed to secure the service, no mails shall be carried either on sea or on land. Even the poor excuse is wanting, as regards the majority in the House, that the Senate is likely to remain for a long time opposed to Democratic notions of army organization, since the latter body will pass under their control politically before the end of the present year. Nor can the Senate plead that the country is so urgent to pay somebody a subsidy that it cannot wait till that measure shall come up in the regular way. On the contrary, the obvious reason for fastening it upon an appropriation bill is that the country will not sanction it as an independent measure.

It is impossible to characterize this species of legislative coercion too strongly. Assuming that *our* way is the right way and the only way to carry on government, and that it must be made to prevail at all hazards, is neither the American nor the British conception of representative government, but is Mexican to all intents and purposes, differing from it only in the mode of its attempted enforcement. Under the English system the House of Commons is the Government, the Ministry being its executive committee, the Crown the keystone of society, and the Lords representing the historic gradation and stratification of the past rather than any separate political force of the present time. The independence of political divisions is not known there, has not been dreamed of since the passage of the great Reform Bill, and if sought to be asserted now would plunge the country into turmoil, being at war with the fundamental principles of the constitution. But the independence of the different parts of our Government is the very thing which makes up its distinctive character, and, whether it be better or worse than any other type of free institutions, it is our type and cannot be successfully assailed without putting the whole fabric in jeopardy. It is apparent from the current debates in Congress that these facts and principles are well understood by both Houses, the respect of lip service being abundantly accorded to them, but that each hopes and expects that the other will not be too strenuous in asserting its prerogative at this juncture. It is to be regretted that the Senate, in rejecting the army reorganization clause, put its action on the ground that there was no time to consider a measure of so much importance. The proper ground would have been that the bill was no place for considering such a measure at all. This would very likely have been the answer if the Senate could have taken hold of the matter with clean hands. The statutes are much disfigured with general acts imposed as "riders" on appropriation bills, sometimes germane to the bills where they are found and sometimes not, sometimes annexed for purposes of mutual coercion and sometimes for the convenience of lobbyists and private speculators. Nothing more slovenly or more subversive of the sense of legislative responsibility can well be conceived. Probably the present difficulty will be resolved in due time by the withdrawal of the obnoxious provisions from the bills in question. But the occasion ought not to pass by without engrafting upon the rules of both houses—by a joint rule, if possible—the principle of rigorously excluding from appropriation bills everything in the nature of general legislation, whether such legislation be agreeable to both houses at the same time, or to one only. In the absence of such rules, and of their strict enforcement, it happens that after repeated attempts at coercion the important business in hand is consigned

in the closing hours of a session to a conference committee, where it is buried under phraseology so obscure that nobody can unravel it in the short time remaining, and members must make a hasty decision whether they will vote to disband the Army and stop the mails, or give their sanction to something which they do not in the least comprehend. In such cases legislation ceases to be a science, and becomes a game of "bull-dozing," ending in a game of chance.

SAND-LOT RATIOCINATION.

MR. BLAINE has felt it to be necessary to defend his course on the Chinese Bill in a letter to the *Tribune*, which is marked by the same want of candor as his speech in the Senate. He says that there has been no "voluntary immigration" of Chinese to California, that the Chinese immigrants have all come "under contract"; but immigration "under contract" is voluntary immigration. Willingness is of the essence of contract. A man who contracts to go to a place goes voluntarily. The mere power to contract implies free agency. The reprobation of other than an entirely "voluntary immigration," which he cites from the Burlingame Treaty, must mean reprobation of the forced immigration of persons who are not allowed to contract. The only objection we can in decency make to the mode in which the Chinese reach this country is that it provides for their return to China. It is the going back under contract, and not the coming, which constitutes, as far as this point is concerned, the difference between them and European emigrants. If Irishmen or Germans contracted for a passage to this country in return for certain payments to be made after their arrival, it would never enter any one's head to propose their expulsion on that ground, and if this were all the Chinese did it would be absurd to censure them. They do this, but they also stipulate that they shall be carried home. But if they generally go back, half of Mr. Blaine's objections to their coming fall to the ground.

His second objection is that they have brought only seven thousand women with them, and that these are "impure and lewd beyond the Anglo-Saxon conception of impurity and lewdness." But we never heard till now that the "Anglo-Saxon conception of impurity and lewdness" was at all limited. The Anglo-Saxon imagination has at all times shown itself equal to all demands made upon it in this field. There never before has been a case, however, in which an Anglo-Saxon government was so overcome by "the impurity and lewdness" of seven thousand women that it was obliged to meet it by prohibiting the entrance of the males of a nation of 400,000,000 on its soil. The usual and proper remedy for the evil Mr. Blaine complains of is a police regulation preventing the landing of this class of Chinese women. Since when did it become necessary for the United States to break a commercial treaty with a great Power to keep out foreign prostitutes, and was there ever a more curious spectacle than an American Senator justifying this step by the allegation that the foreign prostitutes were worse than those that his constituents were used to?

Mr. Blaine's third objection is that the Chinese quarter in San Francisco, as described by the health officer of that city, is squalid, unhealthy, and a hiding-place for loathsome diseases, and that the Chinese live in it separate and apart from the rest of the community. But this is really a charge of neglect of duty against the municipal government. The poor quarters in New York are as foul and loathsome and pestilential as the police will permit. The fourth is that the Chinese laborer, owing to his low standard of living, will "crowd out" the free white laborer. This is an argument, however, in favor of legislation against all laborers who live poorly and are willing to work for low wages. It calls for no refutation beyond the simple statement that we actually find it in the mouth of a prominent Republican orator of the "bloody shirt" persuasion. He draws from the fact that the Chinese Government has allowed the Chinese laborers to come to this country "under contract," and that they are apt to be "abjectly poor" persons, or broken-down gamblers, or "scapegraces of the country," the inference that we are justified in breaking the Treaty ourselves; and he coolly disposes of the objections to the abrogation of the Treaty by Congress without communication with the other party to the agreement by relegating the question of the *modus in quo* to "the schools of taste and etiquette," which is a name he has invented for the usages of civilized intercourse. There is, however, such a thing as insult between nation and nation as well as between man and man, and the desirableness of refraining from insult in international discussion and action is well settled—as well settled as the impropriety of somebody's abusing Mr. Blaine in the Capitol grounds because he thought him a demagogue.

The point by which the Republicans of Mr. Blaine's school who supported the bill are most embarrassed, is the contrast offered by their attitude towards the Chinese to their attitude towards the negro at the South. Mr. Eustis, in the debate in the Senate, as we observed last week, drove him into a corner here, in which he in vain tried to defend himself. All he has to say now in reply to the charge of inconsistency is that the negro was born here, and we have, therefore, to put up with his presence. This is true, but when Mr. Blaine was asked why he used the "hoodlum" outrages on the Chinese, which are more shocking than anything which occurs at the South, as an argument for driving out the Chinese, while he used white Southern discontent under negro rule as an argument for martial law, he calmly replied that "we must take the state of things as we find it." This reply is really as applicable to the one case as the other. The misfortune of Mr. Blaine and his kind is that they are trying to ride two horses. They defend negro suffrage with all its consequences, no matter what they may be, on the "human rights" theory, while they attack the Chinese, who are also human, on the expediency theory, and the result is ridiculous. The arguments he uses in favor of expelling the Chinese drawn from their character and habits would be just as strong if the Chinese had been born here as they are now, and the objections to negro rule at the South lose none of their force because the negroes have been born here. Both cases have to be dealt with. Each requires different treatment owing to difference in circumstances, not owing to difference of symptoms.

In their frantic efforts to cover over the undeniable difficulties of the race question at the South, many Stalwart Republicans—the New York *Tribune* among the number—have laid down the monstrous doctrine that a majority, however ignorant or brutal, has a right to work its will with the civilization of any society it gets under its control, and that resistance to it would be wrong. This is democracy run mad, and, whatever the outcome of the Chinese question, it is pleasant to find that it is serving as a solvent of some of the absurdities begotten by the conflict over negro suffrage. The Stalwarts are forced to acknowledge in California that we ought not to sacrifice our civilization to any theory of rights, and that no superiority of numbers can give any race or class the right to rob and cheat and practise beastliness with impunity. We agree with some of them in thinking that a powerful immigration of Chinamen would constitute a strain to which we have no right to subject our institutions, but they have as yet furnished no evidence that such an immigration is likely, or that it has as yet reached proportions which justify frantic or hasty action. We agree with them, too, in thinking that the Chinaman has no "Divine patent," to use the language of one writer, to come here and ruin or damage American society, even if he is willing to labor; and we hold also that the negro has no "Divine patent" to wreck any machinery of civilized government there may be at the South, or the Irishman a "Divine patent" to appropriate his neighbor's property under forms of law in New York. No man, race, or class has any divine right to work mischief; but when a race or class is working mischief, or is likely to work it, the relief or safeguard is not to be found in the repetition of sounding phrases, but in the calm recognition of the facts, and in appropriate and practicable remedies. The phrase "human rights" is no more an excuse for folding our hands and perishing than the Mussulman's phrase that "God is great."

BULL-DOZING IN 1844.

PUBLIC interest in the doings of the Teller Committee has long since given way to complete indifference, while the Potter Committee bids fair to hold its audience to the end. The significance of this might be disputed ; but even Mr. Edmunds would hardly contend, that the complicity of Presidential candidates with frauds committed on their behalf is not more properly a national concern than the fortunes of individual voters or the purity of local ballot-boxes. It is true that the falsified returns from a single polling-place might under certain circumstances determine a Presidential election ; but this is a part of the general risk of universal suffrage and majority government, and, whatever feeling it might give rise to, could never excite such alarm for our system as would the conviction that the *tone* of the ballot-box-stuffer had infected the class from which Presidents are selected. For more than a generation the popular vote, in State and National contests, has been more or less tainted with fraud, and nobody lost heart about the republic ; yet who will deny that Mr. Hayes's reward of the disreputable officials in Louisiana and Florida who gave him the Presidency, and Mr. Tilden's connection with the cipher dispatches, have opened up a new and painful vista to those who watch our political horizon ?

If the testimony, however, taken by the Teller Committee is not likely to make a deep or lasting impression on the popular mind, it will have its uses in giving the Senate Judiciary Committee some idea of the job assigned it by Mr. Edmunds's resolutions. It will appear, unless we are greatly mistaken, that the question is not of protecting Republican voters, black or white, at the South, but of establishing toleration of difference in opinion, which has never existed in that region. We say advisedly, has never existed ; for though down to the rebellion there were always parties there, on one main question no division was permitted, and sometimes, as we shall show presently, a single phase of that question asserted its authority over all dissentients. Just as secession stamped out Southern loyalty to the Union, so, earlier, the furor which ended in the war with Mexico stifled all opposition. In December, 1844, the Clay Whigs of Louisiana viewed with entire approval the intimidation of a brother Whig, Henry Hubbard, sent by Massachusetts to New Orleans, as Samuel Hoar was to Charleston, to protect the liberties of the colored seamen in those ports. No doubt they would cheerfully have mobbed him if their representations of his imminent peril had not persuaded him to leave the State. Yet only a month before they had themselves been victims of intimidation and violence, simply as members of a party which was striving to prevent the annexation of Texas.

The frauds in the parish of Plaquemine did not, as is sometimes asserted, make Polk President ; the votes of New York and Pennsylvania did that. When, therefore, the news of the result in Louisiana came dragging along through the slow mails, it was a fresh surprise and grief to the Whig party, which had been confident of carrying the State ; but victory or defeat no longer hung upon it. The thought of the mode in which Louisiana was lost to them merely heightened the bitter smile with which they read shortly in President Tyler's message of the "great moral spectacle" of the election, and how "the great and inestimable right of suffrage has been exercised by all who were invested with it, dictated alone by a desire in the selection of the agent to advance the interests of the country, and to place beyond jeopardy the institutions under which it is our happiness to live." Censure for overlooking the naughty doings in the amphibious extremity of a Gulf State would have been wasted on a President blind to what Webster had just been denouncing in Faneuil Hall as "the abominable frauds, the outrageous, flagrant perjuries, which are notoriously perpetrated in all the great cities." "Pennsylvania," he continued, "if, as they say, she has given 6,000 for our adversaries, has done so through the basest fraud. Is it not so ? And look at New York. In the city there were thrown 60,000 votes, or one vote for every five inhabitants. You know that fairly and honestly there can be no such thing on earth."

They managed these things somewhat better, however, down in Plaquemine, whose swamps in 1840 contained only 1,351 whites, men, women, and children ; and which polled that year a total vote of 290. In 1842 the vote had fallen to 272 ; in 1843 it had risen to 340 ; in 1844 it was brought up to 1,014. The Locofoco majority was 970 ; Polk's majority in the State at large was 684, which the Whig Returning Board of that day would doubtless have reduced below zero by throwing out the parish altogether, for good and sufficient reasons. It was, in fact, argued that Clay was fairly elected by 76 majority, taking the vote of 1840 as a basis ; but the hypothetical method of conducting elections was not so well understood then as now, and there were no returning boards. The Whig and anti-annexation senator in Congress, Mr. Barrow, said in his place that "he knew full well that the late Presidential election in Louisiana had been carried by the most infamous frauds. He knew full well that *if there was any legal mode of purging the poll* of that State, it would be found that a majority of the people had cast their suffrages in favor of Henry Clay." To this Mr. Slidell replied, in the House, that Mr. Barrow was not a "responsible" person—we suppose, in the fire-eating sense of the term ; that there might have been and probably were illegal votes cast for the Democratic ticket ; that this sort of thing always occurred in warmly-contested elections, and especially in districts where parties were nicely balanced. He denied that the leaders of the Democratic party in Louisiana had encouraged or sanctioned frauds, and gave it as his "solemn and deliberate conviction" that nine-tenths of all the election frauds ever perpetrated in the State were of Whig origin and in favor of Whig candidates. Whether because of this handsome disavowal, or of the investigation ordered by the Louisiana House on motion of a member from East Feliciana (against which every Democrat voted but two), or because of his subsequent appointment as Minister to Mexico, Mr. Slidell's name has come down to us as directly associated with the Plaquemine frauds. Certainly the arithmetical appearances were opposed to the correctness of his denial, and the sworn affidavits made before the New Orleans Clay Club Committee were strongly corroborative of the Whig charges.

The Presidential election occupied more than a week in 1844, most of the States voting on the 4th of November, but some as late as the 11th and 12th. Louisiana began with the earliest, but, owing to her sparse settlement, kept the country polls open for three days. This custom was not lost on Judge Leonard, the Locofoco representative of the parish of Plaquemine in the Louisiana legislature. He chartered a couple of steamboats at New Orleans, the *Agnes* and the *Planter*, put on board some 350 voters, mostly Irish and Germans, some of whom could not speak a word of English, kept them well supplied with liquor, and so took them down river to the three polling places in the parish, the first being just below his own home. On the *Planter* there was great activity during the trip in filling up tax-receipts—a task which was incomplete when the first landing was reached, and which proved quite superfluous, as the Sheriff, Charles Dutillet, threw away the receipts when offered him, though the law imposed a property qualification. The tickets were taken as fast as they could be shoved into the box, no questions being asked, and every folded ballot being opened. The boatmen themselves, from pilot to engineer and cabin-boy, were made to step up and vote for Polk, and when this great moral spectacle had closed at one landing it was repeated at the next, so that each of the excursionists enjoyed the inestimable right of suffrage from one to three times. Meantime the Whigs of New Orleans, getting wind of the affair, had despatched a boat to witness the proceedings, but the sheriff would not let it touch at the pier, on the ground that he was expecting voters by boat. By this he meant that the honest fellows in question would not brook delay, for elsewhere, when taken to task by a Whig voter for having opened the polls an hour before the advertised time, he declared that the people were clamorous to vote, and he had gratified them. With equal considerateness, when a stranger was challenged to be sworn as to his qualifications, the sheriff snatched the Bible from the clerk's hands and forbade the administering of the oath. When the Clay voter had succeeded, after the greatest difficulty, in making his way through the throng to deposit his ballot, contrary to what was required of the non-resident aliens and minors he was regularly sworn ; but his ballot too was unfolded, and if sometimes received, was sometimes thrown upon the floor, and sometimes a Locofoco ballot was substituted for it. One Whig, who tried in vain to reach "the table on which was the box of the Secretary," prudently retired from the cabaret and "went out on the road, where the crowds were hurrahing for Polk and Dallas on all sides, and crowing like cocks." There having seen a friend menaced, he tried to persuade one of his neighbors not to go in ; but his advice was disregarded, and in a few minutes out came this unfortunate, "without his hat and wounded, his shirt covered with blood. . . . He told me that the sheriff had struck him with a stick, and had inflicted a severe wound on the head, and he showed me a severe bruise on the right shoulder. Then I and all my friends who wished to vote were obliged to leave and go to our homes, fearing that if we remained we should be assassinated."

The bull-dozing aspect of the Plaquemine outrage attracted public attention least—at the South doubtless because violence to opponents

was perfectly familiar, and generally because no one, either North or South, dreamed at that time of seeking a national remedy for such disorders. All saw in it rather a part of the same villany that had, on a tariff issue, carried Pennsylvania, and on the Texas issue carried New York, against the Whigs, by drawing more votes from the ballot-box than ought to have gone in, chiefly by means of fraudulent naturalization. Many Locofoco counties in Pennsylvania, like Plaquemine, polled more votes in 1844 than they had white male inhabitants in 1840, "boding unfair play," as the Philadelphia *North American* temperately remarked. It was notorious that the Locofocos resisted all attempts to diminish the opportunities for fraud. "Every Whig American," said the Alexandria *Gazette*, in the election month, "ought to go for a registry law. And it is somewhat remarkable that the political opponents of the Whigs are always opposed to such a law, and repeal it if passed, in whatever State they may get into power." Gerrymandering, too, they practised with such good success that in Ohio they carried two-thirds of the Congressional districts, although their majorities were to the Whig majorities as 12,817 to 18,864. Their perversion of the civil service to party ends was an old story. In New York, to quote the words of the *National Intelligencer*, they had "the vote of the mass of that class of persons who even in monarchical governments [and so *à fortiori* in a republic, Mr. Corneli !] are precluded from interfering in elections in any manner whatever—that is to say, the dependents upon executive patronage, such as postmasters, contractors, custom-house officers, soldiers in the army, seamen in the navy."

A partial remedy for these evils, within the province of the Federal Government, was the fixing a uniform day for holding the elections, so as to prevent voters going from one State to another. A bill to this effect was passed by the House of Representatives (Dec. 16, 1844), without opposition. Mr. Slidell offered the next day an amendment to the Constitution providing that the President be voted for directly by the people or the legislatures without the intervention of electors. But the Whigs laid stress on a modification of the naturalization laws by extending the term of residence, which had been five years under Washington, was made fourteen years under Adams, and under Jefferson had been reduced to five again. Webster insisted on this in language which laid him open to the reproach of wishing to carry over the Whigs to the then Native-American party ; but Mr. Greeley, more practical-minded, enquired how extending the term from five to twenty-one years would help matters. *States*, he pointed out, would admit aliens on shorter probation, and Michigan and Illinois had already done so. What, then, would be gained ? Senator Morgan encountered a similar snag the other day when he learned from Mr. Dawes that though Chinamen cannot become citizens of the United States they are naturalized by Massachusetts.

As we all know, nothing came of these remedies except as to the uniformity of election day. The Slave Power was abroad, and the annexation of Texas and consequent war with Mexico soon drove all other subjects out of mind. The Plaquemine frauds were forgotten, and Louisiana presently furnished a Whig President as the successor of Polk. The exploits of Judge Leonard and Sheriff Dutillet are only worth recalling as showing the persistency of the Southern character, which Mr. Edmunds proposes to change by Federal interference. In his testimony the other day before the Teller Committee, General Davis, of Mississippi, a Southerner by birth and an ex-Confederate, stated that as a Greenbacker candidate he attempted to get negro support, but to his surprise the Democrats broke up his meetings, sent him threatening letters, and burnt him in effigy. His offence was not of doctrine but of attitude ; he was dividing the whites and distracting attention from the main question—white supremacy. He was in his right ; but will this wholesome division of whites and blacks be best brought about by leaving General Davis to maintain himself with the help of those who share his political views, or by giving him United States marshals to stump his district with him ? The Abolitionists were mobbed in their assemblies, their lives were constantly menaced, they were frequently burnt in effigy, and sometimes hauled to the tar-kettle ; but they stood their ground in communities which gave them neither sympathy nor protection, and in the end they effected not only a division but a revolution of sentiment. The Southern whites face each other as equals, and the minority should at least display the courage of their convictions. The blacks by good behavior, frugality, sobriety, honesty, will conquer the esteem and ultimately receive the open support of the best and most powerful elements of Southern society. This process is now going on in the States where they are outnumbered and cannot excite the jealousies or apprehensions of the whites. In no part of the South can we expect a *modus vivendi* to be reached so surely and permanently by external compulsion as by the natural growth and adjustment from within which alone make self-government a reality, and give character to any political organization.

HOW PARIS IS GOVERNED.

PARIS, February 7, 1879.

'MUNICIPAL PARIS' might be a suitable title for a large work, as Paris is a province by itself. I have often wondered why this book has not been written. We live in Paris, we enjoy its beauty, its splendors, and we hardly know how it is really administered and governed. Paris seems like that princess of the fairy tales who was dressed and undressed every day by invisible hands. The apparent government of Paris—I mean its Prefect and his Municipal Council—are only, so to speak, the figure-head of the ship which has had for its motto since the Middle Ages "Fluctuat, nec mergitur." I should like to show you what there is behind this visible government, what there is in the ship itself.

Every three years the inhabitants of Paris elect, by universal suffrage, municipal councillors ; there are in all eighty such councillors. Their very title shows them to be distinct from the administrators. They are only chosen to vote the supplies and to supervise the employment of the public money. Their only check on the administrators is to vote more or less money, and this is only true of the expenses which are called optional, for there are many which are of an obligatory character and which can in consequence be incurred without their sanction. The sittings of the Municipal Council, which take place now in the Palace of the Luxembourg, are not public, but a short account of the proceedings is sent to the newspapers. They take place every two days. The Council is subdivided into many committees ; it is always presided over by the Prefect, who represents the central government, the Administration.

It is quite clear that a city like Paris, which has an annual budget of more than two hundred millions of francs, which has a foreign floating population of one hundred thousand men, which contains, though it is not nominally the political capital of the country, all that constitutes an intellectual, an artistic, a scientific capital, cannot be governed in the same way as a little municipality. Paris has an imperial character, if I may use a word now so much employed in England ; it ought to be governed by the Chambers rather than by a council named by the arrondissements of Paris. London is really now administered by Parliament ; the vestries of the parishes and the government of the city have been to a great extent superseded by great boards which are directly under the control of Parliament. In France we have never considered elective Chambers as capable of a good administration ; we have a political administration and a technical administration. The Prefect of Paris represents what I call the political administration ; he is appointed by the Minister of the Interior, who is practically chosen by the Chambers. In so far the Prefect depends on the Chambers ; he is a political personage, he rises and falls with a Cabinet ; but while his origin may be said to be political, his powers depend only on certain laws which are not changed by a mere caprice. When he is sitting in his presidential chair he represents a whole body of administrative dispositions ; he has the executive power, and all the vagaries of the municipal councillors do not trouble him in the least. He is all the more strong that behind him stands what I have called the technical administration, a branch which has nothing political in its character ; it is entirely independent of politics. I open, for instance, a little book, a mere 'Annuaire of the Ministry of Public Works,' and I find a chapter called "Direction of the Works of Paris and of the Department of the Seine"; and I find a list of as many as thirty-six engineers of the Ponts et Chaussées, all pupils of the Polytechnic School, all having risen in the various offices which appertain to our Department of Public Works, all having a tenure of office quite independent of the political parties. At the head of the list I see the famous M. Alphand, the creator of the new Bois de Boulogne, the friend of M. Haussmann, the author of the great work 'Les Promenades de Paris.' M. Alphand was a favorite of Napoleon III., who tried to transform Paris completely ; but whatever our radical municipal councillors may think of him, they cannot touch him as an administrator. He could only be removed for incompetence or dishonesty, and he is neither incompetent nor dishonest. Each time that a question comes before the Council affecting the works of Paris the Prefect summons M. Alphand ; the great engineer explains his projects, his plans, discusses, takes his notes, and the best thing the councillors can do is to open their ears to the speeches of so great an authority.

This great Department of the Works of Paris, which is really entirely

in the hands of thirty-six engineers of the state, all well trained, incorruptible men, who cannot get promotion except by merit or seniority, is subdivided into six sections: First, Public streets, public and private lighting, temporary concessions on the public streets, plantations in line, construction of sewers. This section has ten engineers. Second, Promenades and plantations, permanent concessions on the public domain, control of carriages. This section has eight engineers. Third, Water and sewers, derivation of springs, artesian wells, water-pipes and aqueducts, distribution in Paris, canals, drainage, utilization of the sewage, irrigations. This section has thirteen engineers. Fourth, Municipal railways in and out of Paris. Fifth, Creation of the Parisian cemetery of Méry-sur-Oise. Two engineers. Sixth, Parochial road service of the Department of the Seine. All the men who are placed in these various services represent what I have called the technical administration. They do not change when the political administration changes. There are, in consequence, two conservative elements to be found in our municipal government; the first is the character of the laws, which give an overruling power to the Prefect in almost all possible conflicts between him and the Councillors; the second is the natural influence of the technical administrators, who are well trained men, and who hold their offices by virtue of their science and of their personal ability. I have only spoken so far of the Prefect of the Seine; but there is another administrator, the Prefect of Police. In an ordinary township the mayor has all the powers which in Paris are divided between the two Prefects. The prefect of police is in a great capital an imperial officer; he centralizes, so to speak, the police of the whole country. Crime will always try to conceal itself in cities like London and Paris; our *forçats libérés* (returned convicts) are forbidden to live in Paris, but they constantly try to get back to it. The political police, which is indispensable in a country like France, has its centre in Paris. The Prefect of Police is always appointed by the Government of the day; he is essentially a political administrator, but non-elective, and during his tenure of office he becomes really a sort of magistrate. In that capacity he is in daily communication with the Public Prosecutor of the tribunal of Paris (the *procureur général*) and the Minister of Justice. In his own prefecture, behind his army of policemen and gendarmes, he holds a power which is and must be surrounded with mystery. To give you a mere list of the various services of the Prefecture of Police would be very long. All I wish to show here is the complete independence of this imperial service of the Municipal Council of Paris.

The municipal police of Paris has 7,756 agents (in that number are 6,800 common policemen), who received in 1878 a sum of 12,168,850 francs. The policemen received of that sum 10,268,000; they are besides equipped and uniformed, and receive each an indemnity of 185 francs for lodging. There are in Paris eighty-one police commissioners (called *commissaires*), with as many secretaries, who can replace them at certain hours. You recognize the *commissaire* by a little tricolor flag hanging over the door, and in the night by a red lantern. These men are extremely important. Their services cost the city of Paris in the year 1878 the sum of 1,120,100 francs. The commissioner's powers are almost unlimited; all the persons arrested by the police in the streets and in houses are first brought before him; he makes a *procès-verbal* of the declaration of the policeman and of all the interested parties, and sends these reports every day to the Prefecture of Police. Many family quarrels end in his presence—disputes between gentlemen and servants, etc. The commissioner is, in fact, a sort of justice of the peace, an arbiter; he has no judicial powers and cannot himself inflict any punishment, but he can, by his advice, stop many affairs at the beginning. He knows the secrets of most houses; and it is only due to justice to say that these modest servants of the city have always proved worthy of the greatest confidence. But, though they are paid out of the municipal budget, it would be a great mistake to think that they are appointed by the Municipal Council. They are not even appointed by the Prefect of the Seine. They belong to the great Department of Justice, and are chosen by the Keeper of the Seals, as the Minister of Justice is still called, and their promotion depends chiefly on their own direct chief, the Prefect of Police. The commissioner is as independent of the electors of his quarter as a man may well be; he is the representative of law and order, and he has nothing to fear from anybody in the exercise of his important functions.

The *cabinet* of the Prefect of Police has three departments, called *bureaux*. The first is almost wholly political, and consequently a part of its expense is paid by the state. This bureau has to see to the safety of the head of the state, to collect information about secret societies, plots, refugees, strangers, and secret associations. It also has to collect political documents which may have some connection with the safety of the country. The second bureau has in its functions whatever relates to great public crowds—festivities, races, reviews, theatres, concert-rooms, placards in the streets, etc. The third bureau has to examine all the national and foreign newspapers, with a view to the discovery of criminals and absentees. Outside of these services come nine bureaux belonging to the great *divisions* of the prefecture proper. Their names will suffice to give an idea of their work: arrests and expulsions; legal surveillance; prisons, passports, and lodging-houses; lunatic asylums; assistance of children, nurses; provisioning of Paris; navigation of the river; Bourse; police of the streets and carriages; fires; sanitary police.

You see by these mere names that the Prefecture of Police is not solely devoted to the police. It is, in reality, a part of the executive of the city. There are, so to speak, two mayors of Paris. In the budget of the city of Paris, as I will show, figures the budget of the Prefecture of Police, though this last is paid partly by the city and partly by the state.

Correspondence.

THE ARREARS OF PENSIONS BILL AGAIN.

To the Editor of The Nation:

Sir: Permit me to add my testimony to that of your correspondent, "Veteran," in the last issue of the *Nation*, in regard to what he well terms "the recent demagogic bill" passed by Congress. I also served as a regimental officer during the whole rebellion, and have since had some experience as regards pensions. So far as that experience goes I do not hesitate to say that it is the bummers, dead-beats, drunkards, shirks, cowards, and bounty-jumpers of our late war who are now in greatest part the honored pensioners of our demagogue-depleted Treasury. Repeatedly, when applications for certificates of disability have been made to me, have I tried to refresh my recollection as to the applicant by applying to those of my old men whom I still meet for information. These last are usually those who were the best men—who did the work and the fighting, who took care of themselves and the country then, and who are taking care of themselves and the country now. Their disgust at the whole system under which they, who never saw the dead-beats at the front, are taxed to support them, is as emphatic as it is apt to be profane. Judging by my observation I should say that of those unmutilated soldiers who deserve pensions, a large portion from very manliness of character have failed to apply for them; while I doubt if there is a broken-down, miserable drunkard or tramp who served in my company who is not now looking for his "arrears." I suppose that every one knows that convicts in our State-prisons are not seldom our pensioners, and in regular receipt of the public money.

Of course it is no use grumbling. Members of Congress with political aspirations must look after "the soldier vote." If, however, all those who feel as "Veteran" does, and as I do, would only express their feelings out loud, our gifted public men might next time at least think twice before they "sling out" another fifty millions. To do the dead-beat's fighting then was bad enough, without being made to support him all the rest of his useless life. However, in a quiet but effective way I propose to have the satisfaction of "going for" my member of Congress.

Veteran No. 2.

Boston, Feb. 22, 1879.

OPEN SCHOLARSHIPS IN AMERICAN COLLEGES.

To the Editor of The Nation:

Sir: President Eliot's recent report on the working of the system of scholarships in Harvard College has met with much public praise and with some private criticism. The praise was justly given to what the document said, while the criticism referred solely to what it omitted. While discussing very fully the main theme—upon which, after all, there was no great difference of opinion—the report wholly ignored the one point which has been seriously questioned in the Harvard system, the one point wherein it entirely diverges from the English practice. This is the more a matter of surprise because it is a point to which President Eliot's attention was expressly called a few years ago, in the report of a committee appointed by his own Board of Overseers; and it is, moreover, a matter which he himself thought worthy of reference, though not of distinct discussion, in his paper on "English and American Universities," in the *North American Review* for March–April, 1878. The point of difference is this: At Oxford and Cambridge, in England, with

a few insignificant exceptions, scholarships are given without the slightest reference to poverty or wealth. At Harvard College, on the contrary, the very first line of the printed regulations announces: "None but those who need assistance are expected to apply for scholarships" (Catalogue, 1878–9, p. 102). In other words, a scholarship is in England treated as an honor; in America, as an alms.

One of the first points brought to the attention of an American college-bred man who visits Oxford or Cambridge (England) is this difference in regard to their scholarship systems. The English method is sure to be claimed, in conversation, as being a wholesome equalizing influence; the visitor is sure to hear of some case where one of two twin scholarships has fallen to a poor young man, and the other to the heir of an estate. As a matter of fact, all agree that nineteen-twentieths of these prizes naturally fall to those who are stimulated by necessity. The point insisted upon is that this twentieth recipient saves the pride of all the others. No one is expected to sue *in formâ pauperis* for aid, or to reveal the precise condition of his father's resources; and, moreover, each successful candidate has competed, at least nominally, with the whole body of students, and not merely with those who happen to be poor. In the words of the "Student's Guide to the University of Cambridge" (England), "Scholarships are given in reward of merit, and it is the first ambition of a student, after he has become a member of a college, to win this distinction" (p. 62). I confess that this condition of things seems to me far more satisfactory than that prevailing at Harvard College, where young men have told me, with a chagrin amounting to bitterness, and almost with tears in their eyes, of the struggle it cost them to accept this visible badge of poverty.

Let me give, a little more in detail, the facts in regard to the English system. The 'Oxford University Calendar' for 1878 announces thirty-eight scholarships, apart from those awarded by the separate colleges. Not one of these thirty-eight has the slightest reference to wealth or poverty in its assignment, except the three Abbott scholarships for the sons of poor clergymen of the Church of England—a class, be it observed, upon whom poverty throws little social stigma. The scholarships offered by the separate colleges at Oxford, as enumerated in the 'Student's Hand-book for 1876' (the last issue of this publication), are four hundred and sixty, including the "Studentships" of Christ Church and the "Demyships" of Magdalen, which are essentially the same thing. These are subject to a variety of restrictions as to place of residence and other matters, but only eight of the whole number make the poverty of the applicant a condition. These exceptions are the Oades and the Stafford scholarships at Pembroke, the Dyke scholarships at St. Mary Hall, and the five Eaton scholarships at Worcester—these last being for the sons of clergymen of the Church of England. In a single case, the Jodrell scholarship at Queen's College, poverty gives an advantage where the competition is equal. There are thus, all told, about five hundred scholarships at Oxford, in all but a dozen of which the distinction between wealth and poverty is absolutely ignored. So well is this settled that in distinguishing scholarships from the inferior provision known as "exhibitions" the 'Student's Hand-book' describes the latter as being "frequently confined to persons who produce evidence of their need of assistance" (p. 84).

At Cambridge (England) the exceptions to the general rule are still fewer. Out of forty-three university scholarships only the two bearing the name of Abbott are restricted to those needing assistance. Out of four hundred and fifty-eight scholarships administered by the separate colleges, only two—the Spencer scholarships at Corpus Christi—have any such restriction. The Cambridge scholarships are thus about equal in number to those at Oxford, and all but four are open, so far as wealth or poverty is concerned. The two great English universities together have almost precisely a thousand scholarships, less than twenty of which make that invidious distinction which is at Harvard, and at most American colleges, universal.

The simple fact is, that the American scholarships are not such in the ordinary English acceptation, but are rather what are called at Cambridge (England) "sizarships"—a name carrying with it a distinct and acknowledged flavor of social disadvantage.

"*Sizarships* consist of certain emoluments and exemptions given to students in consideration of poverty as well as merit. Some of the sizarships at Trinity and St. John's are of considerable value. *The sizar must, of course, occupy a position of inferiority*, as one avowedly poor in the company of richer men; but, on the other hand, the very avowal of his poverty secures him from many temptations" ('Student's Guide,' etc., p. 63).

The italics are my own, and it is precisely this recognized "position of inferiority" which some of us regret to see reproduced and made permanent in our American colleges under the name of scholarships.

The danger in this respect has not escaped the keen eye of Mr. M. D. Conway, a man uncommonly familiar with both the American and English university systems. In his valuable paper in *Harper's Magazine* for July, 1878, entitled "England's Great University," he says:

"There is one example of the determination that no line shall be drawn between wealth and poverty which Harvard would do well to imitate: Oxford scholarships are bestowed for knowledge alone. Such pecuniary aids to the student are thus by no means signs of his poverty, but may be and are sought as earnestly by the sons of the wealthy as by the poor. Were these scholarships and exhibitions—more than seven hundred in number, and bringing an aggregate of £60,000 annually to successful competitors—bestowed only for the easy qualification of poverty, or were that even considered, each would become a stigma. Many a poor but proud youth would, in such case, fear to apply for the aid he really needs, and which he may now earn by efforts which involve no loss of self-respect, but the reverse" (p. 32).

The attention of the Board of Overseers of Harvard University has been at least once—and I think more than once—called to this aspect of the present scholarship system. The 'Report of the Committee to Visit the College' for 1872–3 points out, with some misgivings, the essentially "eleemosynary" character of these provisions, and makes the following suggestions: "If the statutes of the founders, or their presumable intentions, do not confine the recipients in that manner, it is worth consideration whether scholarships might not be open to general competition, *as are other prizes in college and most of the prizes in life*. It is not unlikely that the existing scholarships were intended as aids to the deserving poor students, and not as prizes, whether so expressed or not in the gifts. *If so, would it not be well to have scholarships which shall not be so confined, but competed for by rich and poor alike*, especially at or towards the close of the college course" ('Report,' p. 21). The report is understood to have been prepared by Richard H. Dana, Esq.; the italics are my own.

I do not think that any undergraduate mind is so obtuse as not to see clearly the difference between an honor which is simply and unequivocally an honor, and a so-called honor which is simply a certificate that among a certain number of poor young men a certain applicant is on the whole the most deserving. In almost all our colleges there are prizes for public speaking or for literary composition. Does any one suppose that these would retain their present value if every competitor had to submit, together with his essay or his oration, a certificate of honorable poverty? Would athletic exercises flourish if all but "those who need assistance" were excluded from the college crew or the base-ball nine? I cannot suppose that there would be the least difference of opinion as to the answer to these questions; and why is not the principle the same in regard to scholarships?

The report of the committee appointed by the Harvard Overseers in 1872–3 further suggests it as possible "that at present many men in middling circumstances are deterred from competing by a fair doubt whether they can properly say that they need assistance, in the sense intended by the application, and a fear that they may be excluding some who clearly do need it" (p. 21). To this is to be added the objection well urged by a recent writer in the Harvard *Crimson* (Feb. 7, 1879), who points out that the present system bears hard on many students whose parents have a just unwillingness to state their precise pecuniary condition—as in the case of a physician or a lawyer whose income is diminishing through hard times or advancing years, or of a business man who is struggling to avoid bankruptcy, and who would be seriously injured by exposing his precise financial condition to the world. It is a great evil, as this writer points out, that "necessitous parties, who are unwilling to proclaim their condition, are tempted to seek the cheaper colleges." There is also the case, not very rare, of those whose parents are able but not willing to support their sons in college, so that the young men, however deserving, are really worse off than if their parents were poor. In all these cases open scholarships would be a blessing. Restricted scholarships, however well administered, will hardly reach them. And even in applications which fall clearly within the letter of the provision for scholarships, the decision as to eligibility must often be difficult. "Need of assistance" is a very elastic term, and even college professors are not always possessed of the delicate tact which elicits truth with the least possible sacrifice of pride.

But, after all, the great objection to the present system is the fact that it introduces or enhances in American colleges those caste distinctions which English universities are laboring to overthrow. "It is

thought by many," says Mr. Dana's report, "that such open competition would tend, so far as it went, to diminish the force of the social distinctions, founded mainly on wealth, which the present method recognizes, if it does not tend to deepen." It is my firm opinion that it does thus deepen them, and this is founded on a good deal of observation and enquiry, a few years since, when chairman of the so-called "Sub-Committee on Discipline" appointed by the aforesaid Committee of Overseers. The evil is diminished this year by the fact that the names of those holding scholarships are at last inserted in the college Catalogue; but the fact that they were so long withheld was a tolerably plain admission on the part of the authorities that they did not regard their own scholarships as an honor to be proclaimed, but as an alms to be concealed. If these incomes are really a distinction to be proud of, how is it that the names of their recipients have been carefully withheld for twenty years?

It is my own strong impression, founded upon some years of committee-work among Harvard examination-papers and recitation-rooms, that the evil of the present restricted scholarships goes farther than this, and that they tend to impair the average literary attainments of the richer students and to make high college rank unfashionable. How can it be otherwise when hard study is becoming more and more identified with the pursuit of a scholarship, and when that pursuit is expressly limited to "those who need assistance"? "Why should —— study? He does not need a scholarship" is a remark that may be heard oftener than one could wish among Harvard undergraduates. President Eliot himself seems to think the system in need of defence at this point, because he takes pains to enumerate the college honors which are open alike to rich and poor (Report, p. 19). But when he goes on to show by statistics that high standing as scholars is not won only by those who need pecuniary aid, his facts seem to me to be very insufficiently exhibited. He tells us that "in 1876, of the first thirty-eight Seniors on the rank-list of the Senior year twenty received scholarships; in 1877, of the first forty-two Seniors twenty-seven received scholarships; in 1878, of the first sixty Seniors twenty-five received scholarships, only five applications being refused" (Report, p. 27). It is not quite apparent why these arbitrary numbers—thirty-eight, forty-two, sixty—were selected. Had he told us whether the first ten scholars in each of these classes held scholarships or did not hold them, the information would have been just what we want.

In colleges where the present scholarship system is already strongly entrenched it will be easy to say that the matter is settled in advance by the intent of the founders of scholarships or by the terms of their foundation. But this is another point which needs elucidation and on which President Eliot's report gives absolutely nothing. Turning to the Harvard College Catalogue, I find by the brief abstracts there given that more than half the founders of scholarships (twenty out of thirty-seven) apparently made no restriction whatever in respect to wealth or poverty, so that whatsoever restrictions are introduced have proceeded from the college authorities alone. It is true that more than three-quarters of the scholarships (eighty-seven out of one hundred and twelve) are thus restricted, but this is because those who have founded several scholarships together—as in case of the twenty-three Bowditch scholarships—have usually favored restriction. The question remains, even in regard to these, how far the policy was dictated by the wish of the donors themselves and how far by the suggestion of the college authorities. It is to be noticed that the first scholarships which went into operation, the Abbot, the Kirkland, and that of the Class of 1814, were entirely unrestricted—were scholarships in the English sense and not sizarships. This throws unexpected light also upon President Eliot's statement (Report, p. 19) that for the first six years—from 1852 to 1858—the names of those winning scholarships were printed in the Catalogue among the honor-men—a practice then suspended for twenty years. The obvious explanation is that at that time the scholarships were more commonly on open foundations. The scale was turned apparently when Mr. J. E. Thayer, in 1857, bequeathed fifty thousand dollars to found twelve scholarships restricted to poor students. Soon after this, it seems, the bestowal of scholarships became inevitably a private and confidential matter. Had the college authorities, however, in this and all cases systematically counselled open scholarships, it is possible that the later foundations, like the earlier, would have been unrestricted.

Be this as it may, the fact remains that the system of scholarships in our American colleges is still in its infancy, and that it is not too late to make a deliberate choice, for the future, between scholarships and sizarships. This must be my excuse for criticising the published report of one who justly holds so high a rank in the administration of college affairs as the President of Harvard University. My own strong conviction is that scholarships, like others prizes in and out of college, should be administered as prizes only, and left unrestricted by any reference to wealth or poverty. The loss of the few scholarships that would be taken by young men not actually poor would be far more than repaid by the increased self-respect and dignity of all the other recipients. The advance of caste and luxury is quite rapid enough in our leading colleges, and I hold that, in the words of the Oriental Padma Purana, "Learning should be rescued from every consideration of high or low."

T. W. H.

CAMBRIDGE, MASS.

Notes.

GINN & HEATH'S spring and summer announcements include a new edition of Shakspere's 'Hamlet,' edited with copious notes by Prof. Henry N. Hudson; 'Elementary Lessons in Language,' by Prof. W. D. Whitney and Mrs. N. L. Knox; a 'Brief History of Roman Literature,' for schools and colleges, by Prof. E. P. Crowell and H. B. Richardson, of Amherst College; 'Remnants of Early Latin,' chiefly inscriptions, for college use, by Prof. F. D. Allen, of the University of Cincinnati; and a second volume of Prof. T. D. Seymour's 'Greek Lyric Poets.'——Henry Holt & Co. publish next month the Fine Arts volume of Symonds's 'Renaissance in Italy'; 'English Actors, from Shakespeare to Macready,' by Henry Barton Baker; and 'Wanderings in Patagonia,' by Julius Beerbohm. ——Jansen, McClurg & Co., Chicago, have in press 'Motives of Life,' by Professor David Swing. ——Lee & Shepard have nearly ready 'Elements of Design,' by Dr. Alfred Rimmer, with an introduction by J. Elliot Cabot.——A Life of the late Robert Heller, by his associate, Miss Hadie Heller, is in preparation, and will be published by G. W. Carleton.——Charles P. Somerby announces 'The Reign of the Stoics,' by the Rev. F. M. Holland.——We have received the first number of *Useful Arts*, a monthly "Journal of American Industries," conducted by James A. Whitney, at 212 Broadway. It belongs to the familiar class of patent solicitors' publications. The editorial articles contain much sound and forcible writing.——Of the monthly *American Statistical Review*, begun with the January number, and edited by Charles S. Hill, we can say little except to express our surprise that Messrs. Appleton & Co. should have undertaken the publication. It is a hotch-potch of facts, figures, "reflections," theorizing, comment on current events, etc., etc. The editor's hobby is expressed in this "reflection for statesmen": "The way to pay the National Debt rapidly—Give a *farm* to each unemployed workingman and outfit."——The second number of the *Oriental Church Magazine* continues its self-imposed task of presenting the creed of the Greek Church without argument, of cementing the friendly relations between the American and Russian peoples, and of fostering their commerce with one another. The contributed articles are entertaining, especially Consul-General Botassi's account of some little-known Greek islands, and the summary of Przhevalsky's expedition from Kulja to Lob-Nor. The editor, by the way, makes no attempt at a uniform transliteration of Russian proper or common nouns.——Van Antwerp, Bragg & Co., Cincinnati, have issued a 'Fonetic Furst Redur,' printed in the alphabet and spelling of the Spelling Reform Association. Mr. T. R. Vickroy, of St. Louis, one of the directors of the Association, is the compiler, acting at the suggestion and with the approval of the President, Professor March. The irreverent will find it an occasional reminder of Josh Billings's cacography.——Part II. of the 'American Catalogue' (F. Leypoldt) extends from *Edwards* to *Lennox*. The number of Peter Parley's works still in circulation strikes one who glances over the volume. Grimm's Fairy Tales are divided among eleven publishers. The list of translations of Homer is long and valuable for reference; and so of Horace and Juvenal. Under State headings, like Illinois, Iowa, and Kentucky, are found special statutes, law reports, compendiums, and other important documents.——By public subscription of several of the prominent parishioners of Trinity Church, Mr. Henry Carter has been giving Organ Recitals on Thursday afternoons in that edifice. They are to be unaffectedly commended, both for the selections themselves and for the high character of the performance. Such a form of public education is of so sure a value that the good example should not be passed over without an expression of gratitude. ——The Tanagra figurines have been purchased by Mr. T. G. Appleton for the Boston Museum of Fine Arts; but so general has been the desire to see them that they will be on exhibition till this evening at the rooms of Messrs. Feuardent & Co., 30 Lafayette Place.

—The duty of a popular magazine to protect its readers from ignorant teaching and from axe-grinding is imperfectly fulfilled in the March *Harper's*. We do not assert that the article on "Gary's Magnetic Motor" should be classed, as regards its ulterior motive, with a recent paper on patents, by a notorious lobbyist, which escaped the editorial vigilance of *Scribner's*. Still, it is manifestly open to grave suspicion when it sets out with the statement that "by his achievement Mr. Wesley W. Gary has quite upset the theories of magnetic philosophy hitherto prevailing, and lifted magnetism out from among the static forces, where science has placed it, to the position of a dynamic power," and ends by saying, "More promptly than the scientists, capitalists moved; and before science had openly acknowledged the discovery and the principle of the invention, men of money were after Mr. Gary for the right to use the motor for various purposes," etc. *Harper's* public ought to know that science has "acknowledged" nothing of the kind, and that both as regards its achievements and its possibilities the Gary motor stands in scientific estimation on the same level as the Keeley motor, after which "capitalists moved promptly" to their cost. Another article which must be pointed out as delusive is one which in the nature of the case was less easy of detection. We refer to Mr. A. T. Story's "English Home of the Washingtons." It seems as if tracing the pedigree of the Father of his Country were regarded as an act of patriotism, so frequently is it attempted; yet the competence brought to the task, even by original investigators, would seldom suffice to produce one good American genealogy reaching back to the first colonist of the name. Mr. Story assures his audience that the Washington descent has been clearly demonstrated beyond his great-grandfather John Lawrence, the emigrant. In fact, the parents of John and his brother Lawrence, who accompanied him to Virginia, have not yet been discovered, while Mr. Story's identifications have been absolutely disproved. His paper is, therefore, as regards a main object of it, worse than worthless. Still, the positive tone which he assumes at the beginning will not mislead the intelligent reader who meets in one paragraph (p. 528) such evidences of rigid induction as "the supposition is," "it is probable," "possibly," "naturally," "seems to be indicated," "Mr. Simpkinson explains these entries by suggesting," etc. Mr. Simpkinson has much to answer for; he is the exploded authority to whom Mr. Story pins his faith.

—Apart from these articles *Harper's* is as entertaining as ever, and not a little instructive. We shall grudge either epithet to the *text* of Mr. S. G. W. Benjamin's "Present Tendencies of American Art," but the engravings after William Hunt, Inness, Eastman Johnson, Swain Gifford, Winslow Homer, W. M. Chase, and the rest, represent nearly or quite the highwater mark of art, we had almost said in this country—certainly in the annals of this magazine. Admirable, also, are the portraits illustrating Mrs. Lamb's historical account of the United States Coast Survey; and of rare merit are some of the Rembrandt fac-similes. Mr. H. W. Elliott tells a wonderful story of the multitudinous sea-birds among the islands of Behring's Sea; Colonel Waring's "Sketches in Tyrol," a first paper, shows the practised observer with an eye for the unhackneyed; and Dr. T. M. Coan, with his isotherms and variations of temperature and ocean currents and configuration of continents, and his scant praise for popular sanitariums, is perhaps unnecessarily depressing to consumptive invalids.

—Mankind takes almost as much pleasure in unsettling as in settling its problems, and therefore, perhaps, the article on "The 'Old Mill' at Newport" in *Scribner's* should be named first as most interesting. The writer, the late Mr. R. G. Hatfield, has unfortunately passed away since his article left the press, and those who feel sceptical about his conclusions can never know how he would have met their objections. Briefly, he had convinced himself past doubt that the Old Mill was built by the Norse settlers of the island for a baptistery, and that "this antique relic, the most ancient Christian building in the United States, is eight centuries old." This was Rafn's view, and on purely architectural grounds it is not without plausibility; still, we do not know why it is "apparent to the most careless observer" that the fire-place and the beam-holes of the second story are modifications of the original plan. The fire-place has always seemed to us fatal to the idea of a long antiquity, and on this point we could wish Mr. Hatfield had been more explicit. Perhaps the subject will be thought worth discussing in the *American Architect*. It is not difficult to concede that the use of the building as a mill was a conversion from the original intent of it. It is hard to explain the silence of the colonial records in regard to its construction, if that were not pre-Columbian; the town records destroyed by the British perhaps would have thrown no light upon the question. But, on the other hand, would anything have been more calculated to astonish the first English settlers than finding in a wilderness a round stone tower on arches, as venerable-looking already as it is to-day? Why does no mention of this occur in any of the records? Is it not an argument against the mystery of it that Gov. Benedict Arnold's will in 1678 simply refers to it as "my stone-built mill"? Mr. Hatfield's reasoning leaves this point quite untouched. The weighty article of this number is Prof. W. G. Sumner's "Commercial Crisis of 1837," which he shows to have been the product of a great variety of causes, but clearly dependent in a very large degree on the mischievous complication of politics and finance, both State and National, in the days of Jackson and Nicholas Biddle. He further points the contrast between New York's definite and quick resumption, with the temporary pinch of liquidation and temporary loss of trade in favor of Philadelphia, and that city's policy of "drift," with its long trail of disasters and dishonor, including the loss of commercial and financial leadership. At the time of the death of the late James Brown we called attention to his part in determining the wise decision of this city and State in accordance with sound principles of business and currency. The beautiful engraving for which we now look regularly to *Scribner's* is shown at its best in the present issue in the charming portrait of Modjeska as *Juliet*. For its remaining attractions, pictorial and literary, we must direct our readers to the magazine itself.

—In the March *Atlantic* Prof. Shaler has a thoughtful paper on "The Natural History of Politics," in which he illustrates some familiar political reflections in an original way by throwing on them the light of the theory of natural selection. He shows that "the diversity of local conditions is a most important element in the advance of the organization of animals," and cites the fact that not only the European man, but the entire organic life of that Continent, is higher in form and has greater vigor in every way than life elsewhere, so that the European species "extirpate the native species in continents of less advanced life where they may become naturalized." He asks "how far human progress depends upon this capacity of a region to develop local peculiarities connected with intellectual and social development," and in answering it contributes some valuable considerations on American life. He acknowledges the two great modifications of the power of natural selection over civilized man in that civilization tends to average local peculiarities and so diminish their value in furnishing variations, and also in the fact that many individuals and types which would have been lost in the ruder earlier struggle now survive. Our problem is in what way and to what extent the loss in the weakened action of natural selection can be compensated by new agencies, and the latter portion of the article gives his conclusions, which are well worth attention. The other articles on political subjects are a condemnation of our land policy by Mr. Julian, and a tentative discussion of the Presidential campaign in the Senate. Mr. Richard Grant White makes a rejoinder to the critics of his articles on "Americanisms," and Mr. Story concludes his description of a "Roman Holiday Twenty Years Ago" in a less interesting way than he began it. Mark Twain's satirical account of "The Great Revolution in Pitcairn" is not up to his best work, and the other pure literature of the number is of ordinary interest, except Mr. Howells's "Lady of the Aroostook," which comes to a pleasant end (to our great satisfaction, for we were afraid of tragedy), and the poems by Longfellow and Whittier, of which that of the former is very striking.

—From a circular bearing date of Cambridge, February 22, and signed by several ladies whose names are closely identified with Harvard College, we learn that a number of professors and other instructors in that institution have consented to give private tuition to properly-qualified young women who desire to pursue advanced studies in Cambridge. Other professors, too much engrossed for teaching, will assist by advice and by lectures, and "no instruction will be provided of a lower grade than that given" in the college. Certificates of the satisfactory pursuit of any courses under this scheme will be furnished by the instructors upon examination, but it is hoped that the greater number of pupils "will pursue a four years' course of study, in which case the certificates for the different branches of study will be merged in one, which will be signed by all the instructors, and will certify to the whole course." This general certificate should then represent an amount of study equal to that necessary to obtain a diploma from the college now; and we suppose it follows that admission to the privileges of the course will be allowed only after as rigid examinations as those which annually determine the freshman class of young men. In this case the plan is another form of Girton

College, or shall we say a germ out of which such a college may grow by endowments providing it with a local habitation, and reducing the expenses of tuition. As to the present expense, we are told that "it will probably not exceed four hundred dollars a year, and may be as low as two hundred and fifty." The ladies' committee "will see that the students secure suitable lodgings, and will assist them with advice and other friendly offices." Information on all points may be obtained of Mrs. Louis Agassiz and her associates, or of their secretary, Mr. Arthur Gilman, 5 Phillips Place, Cambridge, Mass.

—The sport of long-distance and consecutive-period walking has within the past few months become a popular athletic entertainment. Weston is now engaged in attempting to perform the nearly impossible feat of walking 2,000 miles in 1,000 hours over English country roads, while a female pedestrian has in this country lately accomplished 2,700 miles in 2,700 consecutive quarter hours over a sawdust course, and several other women are now trying to beat her by doing 3,000 miles in 3,000 quarter hours. The *Saturday Review* calls attention to the fact that these tests of endurance have been imported into England from this country, and charitably suggests that inasmuch as they began to become popular in the United States at about the time of the enfranchisement of the negro one fact may explain the other ; the negro being no longer available for the gratification of our inhumanity and cruelty, we have developed the new form of pedestrianism to supply us with a sort of public "nigger," whose bodily sufferings and anguish we may get the same pleasure from that we used to get from the writhings of the African under the lash. Unfortunately for this ingenious suggestion, the new sport was invented, or at any rate has been chiefly developed, in the free and enlightened North. We fear that nothing short of an inborn love of cruel amusements will explain the phenomenon. There is in the spectacle itself absolutely nothing of the slightest interest. In almost all other sports there is some rivalry, some struggle, or an exhibition of the human form brought to a high pitch of muscular perfection ; in this there is nothing but a woman, dressed in short skirts, her legs encased in some kind of worsted hose, walking monotonously round a sawdust ellipse, about which sit a number of stolid spectators, who every now and then break out, apparently without rhyme or reason, into frantic applause. After walking round a certain number of times she goes off into a room, where she falls asleep. After a certain number of days of this her feet begin to swell and become painful ; later on she begins, it is said, to see visions, and walks round in a sort of dream, like those which people dying of hunger and thirst have ; at any rate, she can barely stand upright, and has to be forced up to her work. When she finally leaves the track she is in a condition which makes continuous medical attendance a necessity to save her life. We confess we cannot see why such brutal exhibitions as this should be allowed in a civilized community. It is nothing more nor less than a public trial by slow torture, which does not advance athletic sports in the least ; for the actual walking done in these sawdust rings is not, as walking, good for anything. 3,000 quarter miles in 3,000 quarter hours is at the rate of 24 miles in 24 hours, which, with regular intervals of sleep, anybody can do. It is in fact, in a new form, a revival of the mediæval torture of preventing a person from getting his sleep for a long time. It is immeasurably below prize-fighting, bull-fighting, and a number of other cruel sports which the police nowadays break up. The curious part of it is that the test lasts so long a time that the gate-money taken in reaches a large sum, and a woman may, if she can accomplish the feat, earn a small fortune. The subject is one which those who are interested in woman's rights and in the prevention of cruelty might look into with advantage.

—"H. M. S. *Pinafore*," the joint operatic production of Messrs. Gilbert and Sullivan, has achieved at the Standard Theatre a very unusual success, and promises to draw crowds for weeks to come. It is, strictly speaking, an English *opéra bouffe*, so far as the libretto is concerned, but the music is of a different order. *Sir Joseph Porter, K.C.B.*, who works his way up, by strict attention to his menial duties as "office-boy to an attorneys' firm," to the proud position of First Lord of the Admiralty ; *Captain Corcoran*, whose aim it is to be a "really popular commander"; the First Lord's antiphonal chorus of sisters, cousins, and aunts ; the cynical *Dick Deadeye*, *Little Buttercup*, in fact all the characters are *bouffe ;* the world in which they act their parts is inverted, as Offenbach would invert it, though without Offenbachian license. On the other hand the music is, in great part, marked rather by its resemblance to than its departure from ordinary standards. Most of the airs are very pretty, and distinguished by a vein of tender sentiment or dramatic passion which, from first to last, suggests legitimate Italian opera rather than the school to which "Barbe Bleue" or "La Grande Duchesse" belongs. One device resorted to so much by the French composers of *bouffe* music for the purpose of giving lightness to their productions, the use of strongly-marked waltz-time, is not, we believe, to be found in Mr. Sullivan's score at all—certainly seldom if ever. But on the whole it would be difficult to say which is the best, the score or the libretto. With regard to the representation at the Standard, the acting and singing, though not by any means what they ought to be, have proved quite good enough to bring out the strong points of the opera. Mr. Whiffin in *Sir Joseph* has, by common consent, carried off the palm, though his action, for a burlesque part, is altogether too quiet for our taste. If there are any artistic laws as to burlesque, one of them probably is that it goes by opposites, and hence it follows that the acting of a part like that of *Sir Joseph* should be marked by the opposite of that seriousness and decorum which may be supposed to be the leading traits in the character burlesqued—in other words, by a grotesque levity. Levity is, indeed, the natural atmosphere of a *bouffe* world, and it is in the rapid lapses from lofty mock dignity and seriousness to utter levity that half the amusement of good *bouffe* acting lies. Mr. Whiffin is an excellent actor, but if his *Sir Joseph* is open to any criticism, it seems to us that he makes him too nearly the serious hypocrite of a comedy instead of the burlesque naval character invented by the authors.

—Mr. Gilbert, it should not be forgotten, is no English Offenbach, but the writer of several serious plays, which have had first and last a fair share of success. Indeed, he is not only a dramatist, but a poet as well, and his dramas have been collected into a book which was sufficiently good to have provoked a discussion, between lovers of plays which can be read and cannot be acted, and devotees of dramas which can be acted even though their warmest supporters would shrink from the task of reading them, as to whether they could be considered permanent additions to literature or not, whether they do or do not belong to literature. "Pygmalion and Galatea" and the "Wicked World" were very pretty plays of a novel sort. In them the interest turned not so much upon the plot as upon the attempt to present to the audience in a dramatic form the eternal contrast between poetry, or the ideal, and life as it is. In the "Wicked World" we have the pure happiness of fairyland contrasted with the evil passions and ambitions of our world ; in "Pygmalion and Galatea" we have the world again seen through the eyes of a woman brought to life for the purpose. In these plays the intention of the author was serious, though in the execution the line between comedy and burlesque was nearly approached, and in the acting, as a rule (owing to the fact that the New York stage affords few actors with sufficient delicacy of perception to play Mr. Gilbert's parts), it was frequently passed over, or obliterated altogether. In "Engaged," now acting with great success at the Park, he has written a burlesque which nobody but the author of "Pygmalion and Galatea" and the "Wicked World" could write, for it is a burlesque of precisely that poetical, romantic, and ideal notion of life which those plays were intended to bring out in a half-humorous, half-idyllic contrast with pure selfishness. "Engaged" is put down on the bills as a "burlesque comedy," and some notion of the general drift of the sentiment of the play may be gathered from the fact that it opens with a scene illustrative of the simple virtues of peasant life, in which we learn that *Angus MacAllister*, a lowland Scotch lad of a highly emotional and sentimental nature, is supporting *Mrs. MacFarlane*, the widowed mother of his intended bride, by throwing passenger trains off the neighboring railway in order that the widow may derive a livelihood from the custom brought to her house by delayed passengers. The main plot of the play turns on a Scotch marriage and the complications to which this gives rise. The amusement of it is produced in great measure by the burlesque struggle in the breasts of the *dramatis personæ* between greed for money and romantic love, or, to put it more accurately, upon the deliberate sacrifice of love and every other pleasing and poetical sentiment, by all the characters under all conceivable circumstances, to the recognized necessity of having all the money they can get as the *sine quâ non* of existence. The play-bills are headed by the following "note" :

"The author's intention in writing this play was to try the effect of treating a broadly farcical subject in a grave and earnest spirit, and without extravagance in tone, gesture, or costume. It has always been found that where the parts were played in accordance with this theory the comedy has been eminently successful."

It would be rather difficult to imagine the play acted successfully in

any other way; at the "Park" the acting is good throughout. Mrs. Agnes Booth's *Belinda Treherne* is a remarkably perfect performance. Mrs. Booth was educated in the old-fashioned tragic school, which, by the very slight exaggeration she knows so well how to give, becomes at once transformed into burlesque.

—The success of the "Pinafore" has stimulated the ambition of managers in all directions, and we are now fairly embarked on a season of Gilbert and Sullivan. Besides a short-lived "Pinafore" at the Lyceum, and another of hardly greater vitality at the Fifth Avenue, not to speak of an African version by the San Francisco Minstrels, or "A Kiss in the Dark" and "Trial by Jury" by the same authors, within the past few days the "Sorcerer" has been brought out at the Broadway Theatre, with Miss Matilda Scott as *Aline* and Mr. W. H. Lingard as *John Wellington Wells*, of the firm of J. Wells & Co., Family Sorcerers. This opera is not so amusing as the "Pinafore" (though the dialogue is comical to the last degree), nor is the music so taking, but there is no reason why it should not, if properly brought out, have a good run; but there is small hope for it at the Broadway, where the difficulty is that few of the company can act and almost none can sing. Miss Scott, who has a good enough voice and is a thoroughly trained singer, makes no attempt at acting. Mr. Lingard, who is a good actor of very low comedy, must curse the day on which he undertook melody. The plot of the "Sorcerer" is not, in the first act, sufficiently clear to fix the attention; in the second, it becomes distinct enough, and the situation, after the incantation scene and the administration of the family sorcerers' love-philter to the villagers and the consequent amatory confusion, is very amusing.

WEISSE'S ORIGIN OF THE ENGLISH LANGUAGE.*

DR WEISSE'S book is on one side a sort of "epitomic encyclopædia," as he calls it, of everything interesting which the doctor knows, and he seems to know something about almost everything. He does not confine himself to England and America, but expatiates freely through France, Germany, Italy, Spain, and Portugal, and whatever regions know the Greek, Latin, and Arabic languages. Thoughts, ideas, languages, and literatures act and react on each other, he says. Students of science, art, theology, law, medicine, or mechanics; teachers, pulpit orators, scientists, legislators, journalists, historians, poets, dramatists, and novelists, may here find something about the growth of their respective vocabularies. Reformers and their vicissitudes and their persecutors are "vividly portrayed." Social, religious, scientific, and artistic questions, literary criticism, metaphysical, spiritual, state, and national topics are "felicitously touched." The reader is led through a vista of fourteen centuries of linguistic, literary, and biographic progress, only to regret that there are not three thousand years of it. Or if an investigator wishes to examine particular lines of progress an excellent index is furnished, and under general headings, such as *medical*, *legal*, *astronomic*, references may be found to the pages where mention is made of facts connected with the subject. All these matters are handled in an off-hand style, and are intended to render the book attractive to the general public.

It is not in view of anything of this sort that Professor Whitney and Charles Sumner and General Grant and Her Majesty Queen Victoria, and scores of English and American scholars, statesmen, and divines have written letters of encouragement to the author, and that, rising to the height of his great argument, he dedicates his work "to the English-speaking populations in Europe, America, Asia, Africa, and Oceanica." Underneath this light and attractive exterior lies the solid substance of a scientific examination of the origin and progress of the English language. Its backbone consists of a series of tables giving the results of an analysis of one hundred and fifty linguistic specimens, beginning with the earliest Anglo Saxon and coming down to the present day. The author selects a suitable passage and reads until he obtains one hundred different words. He then counts the whole number of words read. He notes the number of repetitions and of particles, and classifies the words according to their derivation. In Milton, for example, he selects 'Paradise Lost,' Book I., beginning with line 115. It takes 135 words, making 19 lines, to give 100 different words. Twenty-six per cent. of the 135 are repetitions, and there are 59 particles Of the 100 words there are 9 Latin, 27 French, 57 Anglo-Saxon, 4 German, 2 Welsh, and 1 Hebrew. These words are arranged in columns, with all the facts and figures tabulated; and this is the scientific examination of the language of Milton. The index reports that ninety such tables are given. These tables are combined by periods, and a synopsis is given of the Anglo-Saxon period (A.D. 449–1200) the "Franco-English" period (A.D. 1200–1600), and the English period (A.D. 1600–1878).

On the basis of these tables Dr. Weisse proceeds to a discussion of the language in proper scientific form. It is a familiar fact that Anglo-Saxon was a Teutonic tongue with few Romanic words, that after the Norman invasion there was a large mixture of Norman-French, and that we have been adding little Teutonic and much Latin, Greek, and Romanic ever since. Dr. Weisse now states it scientifically: Anglo-Saxon contains of Teutonic, 91 per cent.; Franco-English contains of Teutonic, 50 per cent.; English contains of Teutonic, 30 per cent. Readers of Milton and Shakspere know that Milton used the more Greek and Latin. Dr. Weisse has the figures: Milton 36, Shakspere 33. The materials of the tables are combined in various ways. Separate tables are made according to subjects, from which it would appear that the poets average 66 per cent. of Teutonic and the novelists 61, while didactic or scientific writers use only 49, newspapers 47, and historians 46. Of all poets Bryant and Halleck have most (77), Wordsworth least (49). Ben Jonson has least of the dramatists (39). Of all writings the Bible has most Anglo-Saxon (78), and the New York *Observer* the least (33). The *Nation* stands in the golden mean (53). Of repetitions the Bible with its 46,219 *ands* has the largest percentage (81), Milton the smallest (26). Of particles Moody and Sankey have the largest percentage (62), the Bible has the next (61), Bishop Berkeley the smallest (39). The nouns are collected in a table, so also the verbs, the adjectives, and the adverbs. There are 1,097 nouns, 520 verbs, 445 adjectives, 107 adverbs, and 113 particles in the 50 tables of the English period. 2,282 different words are all that are obtained by reading 9,554 words. These and the like observations, enlivened by explanations and predictions, constitute the body of scientific discussion.

It appears, then, that the book is a collection of curiosities in the proportions of our vocabulary rather than anything like what scholars mean by a scientific history of our language. Such a history is based on a biography of each word, telling when, whence, in what spelling, with what meaning it is first born into the speech, and giving a narrative of its life as it figures in succeeding authors. On this basis an induction of the diction of each notable author, and of each generation and era, may be made, and the whole brought under general laws of progress. The first stage of such a history is to be found in dictionaries like those of Grimm, Weigand, and Littré. Completed histories are yet to be noted as deficient, scientific philology is very young; but German students will remember the histories of the German speech by Grimm and Schleicher and Scherer, and English scholars have welcomed an essay in that direction by Oliphant, lately published by Macmillan. But it is not the thing to abuse good work for not being some other kind of work. A thorough tabular investigation of the kind which Dr. Weisse presents might be of importance, even if it cannot rightly be called a history of the language and literature. It must be confessed, however, that Dr. Weisse's investigation is in the touch-and-go style. To judge of an author from an examnation of one hundred words is mere guessing. Serious discussion of the style of Chaucer or Milton on that basis is out of the question. Passages of that length may be found as different in their proportions in the same author as the averages of the most different authors. When attention is directed to the New York *Observer* as having least Anglo-Saxon, and the Bible as having most, one cannot help suspecting a joke. Surely it is possible to find one hundred words having a fair proportion of Bible English in any, or almost any, issue of that venerable sheet. In Marsh's 'Lectures on the English Language,' the proportions of Anglo-Saxon and other words are given for about thirty authors. To obtain the proportions for Webster, his great speech in reply to Hayne is examined entire—as many words, we should guess, as Dr. Weisse examines in his whole bookful of authors together. For Shakspere three whole acts are examined; for Milton, a book of 'Paradise Lost,' 'L'Allegro,' and 'Il Penseroso'; for the New Testament, thirteen chapters from different books. Mr. Marsh gives the number of Anglo-Saxon words in each hundred as they stand, counting the repetitions. This method Dr. Weisse belittles; he counts no repetitions. But there are two interesting facts of proportion in an author, one the proportion of words as they stand, as given by Mr. Marsh, the other the proportion of different words in their vocabulary, which Dr. Weisse affects to obtain. But Dr. Weisse's method of excluded repetitions has this defect, that it gives different results in the same matter according to the length of the passage examined. As the repetitions are more frequent in Anglo-Saxon words, the longer the pas-

* 'Origin, Progress, and Destiny of the English Language and Literature. By John A. Weisse, M.D.' New York: J. W. Bouton. 1879.

sage the less will be the percentage of Anglo-Saxon. A passage in which every successive ten words have ninety-nine per cent. of Anglo-Saxon, may have in each one hundred words eighty per cent., and in each one thousand words fifty per cent.; so that the real percentage of an author cannot be given till the whole of his works have been examined, or till his vocabulary has been exhausted. Mr. Marsh accordingly undertakes to give this kind of proportion only for those authors of whom we have complete concordances, or vocabularies; and he gives it for these, of course, by examining the vocabulary. And for the whole language, which Dr. Weisse would reach by summing his scraps of tables, Mr. Marsh goes to the dictionary, as, in fact, does Dr. Weisse also.

Dr. Weisse has given the hours he could spare from another profession to this work for thirty years, but after all he is not a specialist in linguistics, and he cannot be trusted in the more difficult niceties of English etymology. He takes for his first passage some of the laws of Ethelbert as a solitary specimen of the language of the sixth century. But these laws in the form in which we have them are from a MS. of the twelfth century, and cannot be trusted as linguistic specimens of an earlier period. A somewhat similar remark may be made of the next extract, from Caedmon, of the real history and linguistic relations of which he shows no knowledge. His table of it contains five words classed as Latin, but four of the five, *modum*, *maegna*, *rice*, and *ord*, are aboriginal Teutonic.

In the later passages the general division between Teutonic and Romanic is usually fairly accurate, though doubtful words are set pretty regularly in the Romanic columns. Anglo-Saxon *lord*, *chosen*, *islands*, *care*, *time*, *law*, *call*, *seem*, with the doubtful *sky*, *haste*, and *cloud*, are all put on the Romanic side, and hardly balanced by *pluck* and *devil* in the Anglo-Saxon of the same tables, which might have been restored to their Greek and Latin originals. But Dr. Weisse seems to have taken great pains in assigning the words to special languages. Thus, he finds among his one hundred words from Shakspere, German, Danish, Celtic-Scotch, Welsh, Armoric, and Cornish, as well as Greek, Latin, and French. This is the least valuable part of the work, and betrays want of familiarity with the transition forms of early English. The pronominal adjectives, adverbs, and conjunctions, for example, the regular descendants of the Anglo-Saxon family, are distributed among the Gothic, German, Scandinavian, and Celtic languages. Thus, in the Shakspere table, *as* and *so* are classed as German, *such* as Scotch, and in the next three tables *their* is classed as Icelandic, *than* as Gothic. So on the Romanic side the division to Latin, French, Portuguese, Spanish is freely handled, with an inclination to throw French into Celtic and Latin. Thus, the so-called Armoric words in Shakspere are *dicer*, *herald*, from the French; a little further on *attempt* is also called Armoric. The French column is also robbed of *very*, old English *verai; claim*, old French *claimer; cattle*, old French *catel*.

But if what we have called the backbone of Dr. Weisse's book is a little weak, the doctor has the scientific spirit strong. He wishes to improve the estate of man. He presents impressive tableaux of the expanse of the English-speaking races. He shows their probable destiny. The English language rules, he says, 318,298,857 souls, about one-fourth the population of the earth, and 13,318,370 square miles, about one-fourth of the land of the earth. It is destined at no distant period to become the universal language. Whatever will make it easier even in the slightest degree to acquire or to use is an incalculable gain to the human race. One obvious way of making it easier both to acquire and use is to simplify the spelling. "No doubt the harmonizing of letter and sound is the important literary and scientific question for the English-speaking populations." Dr. Weisse proposes in his preface to show the inconsistency of so-called English orthography, to suggest a method to write and print English as it is pronounced, and to stimulate the English-speaking millions to simplify the writing and printing of their language so as to make it a desideratum for universal adoption. Some pages are devoted to showing up the badness of our present spelling, and urging its simplification, but a positive exposition of Dr. Weisse's harmonic method seems to be wanting; we only gather that it consists of added accents, umlaut and diagrams. It will "phonetize English with very little change or expense; involve no confusion either in writing, reading, education, literature, or science, and will not interfere with books now in our libraries." These are brave words. This is a method which is a method —a medicine indeed. We only hope that Dr. Weisse may have made it, in Lord Bacon's phrase, good to take as well as good to work, so that children may cry for it.

LESSING'S DRAMAS.*

FEW Englishmen had ever heard of Lessing, in all probability, previously to the representation on the boards of the Haymarket Theatre, in 1786, of "The Disbanded Officer; or, Baroness of Bruchsal," an adaptation of his "Minna von Barnhelm," by Mr. James Johnstone. Still more important, as contributory to acquaintance with his genius, was William Taylor's very creditable reproduction of "Nathan the Wise," first published in 1791. The prose rendering of his 'Fables, Epigrams,' etc., by Mr. Richardson, has won but very little attention; and no less obscure is the translation of "Minna von Barnhelm," by Mr. Robert Harvey. For the third time, this favorite comedy accompanied, however, by its author's "Freethinker" and "Treasure," companion-plays, appeared in our language in 1838. We now have, moreover, no fewer than four vernacular versions of his 'Laokoon,' and also, in an English dress, his famous essay, entitled 'The Education of the Human Race,' and great part of his spirited 'Letters to Pastor Goeze.' As to Lessing himself, the excellent biographies by Mr. Sime and Miss Helen Zimmern at last preclude all ground for complaint, on the part of the general reader, that circumstantial information regarding one of the foremost German thinkers and writers of the eighteenth century is not readily available.

The dramas of Lessing, the unfinished ones apart, comprehend, besides the nondescript "Nathan the Wise," three tragedies—"Miss Sara Sampson," "Philotas," and "Emilia Galotti," and eight comedies—"Damon," "The Young Scholar," "The Old Maid," "The Woman-hater," "The Jews," "The Freethinker," "The Treasure," and "Minna von Barnhelm." Of all these we are offered translations by various hands in the volumes under notice.

Few if any of these compositions, that which is first named excepted, are such as to entitle Lessing to a higher than secondary rank among dramatists. "Miss Sara Sampson" could never have gained the popularity it once enjoyed in Germany, Italy, and France had due heed been shown, in appraising it, of the ordinary probabilities of human nature; or, in other words, perhaps, if England, where the scene of action is located, had not been considered as a region productive of exceedingly peculiar people. In "Emilia Galotti," as has often been observed, everything is well-nigh spoilt by the fifth act, not to object that *Marinelli* is much too great a villain for any realm this side of pandemonium. "Philotas," however formerly viewed, must now necessarily strike one as hardly above the level of morbid rant, and withal puerile. "Minna von Barnhelm," from its localism of tone and interest, belongs far too much to Germany, and to Germany of the past, for cosmopolitan acceptance. Of "Damon" and the rest it seems enough to say that any curiosity short of insatiable will probably be allayed by skimming one or two of them, unless they be read for their incomparably genuine German. It is remarkable that Lessing, provided he had an eye in his plays to posterity, should from want of prevision have depicted there so much which he must have known was soon to become obsolete. Nor have hyperbolically extravagant delineations, such as, for example, *Damis* in "The Young Scholar," their admirers any longer.

There exist in print at least three rivals of the present capital translation of "Nathan the Wise," which we owe to the practised skill of Mr. R. Dillon Boylan. The lofty tone of philanthropy and liberality which pervades this work raises it immeasurably above Lessing's other dramatic efforts—efforts which, with this single reservation, add little to his fame.

That Father Bouhours, for the asserted fatuousness of querying the possibility of *esprit* in a German, should have incurred the burly and obtuse ridicule of Mr. Thomas Carlyle, echoed by many who share his idiosyncrasy, will move the surprise of no one who appreciates alike the nature of *esprit* and the distinctive traits of typical Caledonianism. To Germans, as to Scotchmen, for the most part, while there are peculiar charms in the tiresome, the circuitous, and the grotesque, the production of the *spirituel*, and equally the faculty of cognizing it when produced, has, doubtless for the best of reasons, been denied by a wise Providence. Heine, in modern days, and Lessing, in days that are past, make up assuredly a category of their own; and yet we conceive that, touching the latter, it was wholly because *esprit* was not more spontaneous to him that in the character of a writer of comedy he provokes somnolence so much more readily than smiles. We are disposed to speculate, however, that, as concerns tragedy, his success might have been much greater than it was if he had devoted more pains to it, especially in the maturity of his powers.

* 'The Dramatic Works of G. E. Lessing. Translated from the German. Edited by Ernest Bell, M.A., Trinity College, Cambridge. With a short Memoir by Helen Zimmern.' 2 vols. London: George Bell & Sons. 1878.

Socialism, at the present moment, immediately suggests Germany; and no student of German literature, or personal observer of German domestic life, can wonder at attempts towards their practical association. To confine ourselves to books, the state of things necessarily tending to such a result is strikingly exhibited therein, as at the hands of scores of Lessing's literary successors, so by Lessing himself, not to go back to a date more remote. We refer to the altogether too free-and-easy terms represented, and closely enough after the life, as subsisting between German servants and their masters and mistresses. Wherever such a condition of affairs is suffered to establish itself we may lay our account with finding, in spite of the presence of monarchy and of nobiliary distinctions, that an impatience of social inferiority, with aspirations after social isocracy and socialism in all its protean aspects, will in time assert itself. But the subject is one which we cannot pursue here.

Mr. Ernest Bell and his coadjutors have executed their task in a conspicuously praiseworthy manner. By way of amending their translations we could do little more than propose, here and there, something a trifle more nearly equivalent to the original. Over and above occasional very faulty and perplexing punctuation, printer's mistakes which have escaped the editor are such as, in the Tragedies: "Love always plays [supply *them*] the worst of tricks," p. 145; "my own [read *only*] son," p. 151; and, in the Comedies: "the right [read *sight*] of a friend," p. 5; "a wedded friend [read *fiend*]," p. 83; "how easy [read *easily*] people might have fancied," etc., p. 170. Slight casual omissions we have observed at pp. 82 and 94 of the first volume, and at p. 35 of the second. Instances of bad and questionable English are, unfortunately, common. Noticeable are: "Tell me, *who* did you get to write it?"; "It was her daughter, not *me*, whom she spared"; "*very* vexed"; "some new *rubbishing* volume"; "*However* do you come on this nonsense?"; "*Wherever* did I put it?"; "*Whatever* has come into your head?"; "*Whoever* would have let himself dream of it?"; "Does a marriage come about in any house whatever, without the *likes* of us?"; "you and the *likes* of you"; "directly" for *as soon as;* and "trouble" for *trouble yourself.*

The Magazine of Art. Illustrated. (London, Paris, and New York: Cassell, Petter & Galpin. 4to, pp. 252, xxxvi.)—This volume is the first collected and bound-up series of numbers of the above-named newly-founded monthly. It is printed without separate headings to the different numbers, so that the volume seems at first to be one complete publication; a unit and not a collection of units. But further examination proves that it consists of nine monthly parts, beginning with May, 1878, and ending with January, 1879. There are nine papers on the Paris Exhibition, quite fully illustrated with wood-cuts of several of the buildings and of pictures and statues and works of decorative art which were contained in it. A series of letters on "Living Artists," with portraits, has interest as an addition to our biographical dictionaries. Elsewhere, under various headings, are good bits of information, as where, under "Etching in England," something positive is told the reader about Mr. Haden and Mr. Whistler. In general the book may be described as a very judicious attempt to popularize sound ideas and trustworthy information about the fine arts. The field is so vast that every such periodical, trying to keep up with the interests of the day and to treat also of some subjects of permanent interest, is sure to seem fragmentary and even superficial when collected in its annual or semi-annual volume. That cannot be avoided. Artistic periodicals, when bound up and stood on our shelves, become books of reference; firstly, for the past record of the times they represent, and, secondly, for those statements of general fact and principle which they contain, and which may not be at hand in another shape. But for these purposes they need full indices. The splendid set of the *Gazette des Beaux-Arts* has no indices at all in the separate volumes; its first series has a fairly complete and fairly accurate index in two volumes (or rather two separate indices, each for a certain part of the series), but the new set has reached its eighteenth bound volume now with never an index, and none as yet advertised. This is all wrong; for, again, it is only as a book of reference that a bound set of a periodical can claim much value and importance; people will not make it their common evening reading. The volume before us of the *Magazine of Art* has a classified contents and list of plates, but no index properly so called.

The Speaking Telephone, Electric Light, and Other Recent Inventions. By George B. Prescott. (New York: D. Appleton & Co. 1879.)—This book will be discovered upon examination to be a republication of 'The Speaking Telephone, Talking Phonograph, and Other Novelties,' by the same author, published in 1878. The new volume contains two hundred pages of added matter, and omits two or three pages of Mr. Dickerson's brilliant argument in the Quadruplex case, which formed a part of the introduction in the original work. The acknowledgment of indebtedness to Mr. Dickerson contained in the original preface is also omitted, and the author's characteristic avoidance of quotation-marks is again noticeable. In the first paragraph of the addenda Mr. Prescott says: "As the introduction of new matter in its proper place in the old chapters would necessarily lead to some inconvenience, we have concluded to embrace what we now have to say in a new chapter, although in doing so the general arrangement will by this means be somewhat broken up"; which seems to mean that the author was not willing to undergo the "inconvenience" of rewriting the book and introducing the new matter in its proper place.

The new edition is well printed on fine paper and profusely illustrated. It needs no reading between the lines to see that one object of it is to convey the author's solution of "the question as to whom we are indebted for the telephone," to cite the language of the preface. This is (page 217), that "whether or not Professor Bell invented the telephone independently of Mr. Gray" the author has "no means of judging," "but that Bell was not the first inventor" the author thinks "the facts conclusively show." As the owners of the Bell patents have commenced litigation for the enforcement of their alleged rights, it may be as well to postpone an acceptance of the author's conclusion until the facts have been determined by the courts.

The Return of the Native. By Thomas Hardy. (New York: Henry Holt & Co. 1878.)—Mr. Hardy's latest novel is another of his peculiar studies—for they are nothing else—in rustic English life, whose phases he understands so well. It is said that he was reared upon a heath, and he should therefore have been at home in selecting such a place as Egdon, in Wessex, for his scene of action. After he has written a few stories even the most original author will begin to reproduce. In the 'Return of the Native' some of the author's favorites reappear, with changes appropriate to their environments. To be a heroine in Hardy's works is to be, in some measure, faithless, and Eustacia Vye, of the present volume, is no exception; while the results of perfidy prove more disastrous than heretofore. Eustacia is a woman of extreme beauty, of a certain sinister sort, possessed with a devouring yet petty ambition to "better her condition." She has set her mind upon town life as her proper sphere, and adopts all measures to secure a husband in order to escape the hated solitude of Egdon heath. Casting off one lover as heartless as herself, she manages to win the hand and, worse for him, the heart of the "native," a young jeweller just returned from Paris. By deception of the most exasperating kind she gradually estranges her husband from his mother. Though Hardy's novels are not the place to look for it, there is much genuine pathos in this mother's grief and ultimate death of a broken heart. The intimacy between Eustacia and her former lover, reinstated in her favor now that both are married, is discovered, and a separation of husband and wife ensues. She determines to run off with Wildeve, her paramour, but on the very night appointed, choosing the lesser evil, drowns herself. After her death and that of her lover the story is provokingly prolonged to enable the author to reward the deserving. If he had intended to point a moral he would wisely have stopped his story at the climax. As it is, the happy termination by no means compensates the sense of regret for the loss of so much physical beauty, evil as it was, in Eustacia's drowning. This woman, one of those who may be presumed to be guilty till they are proved innocent, reminds one forcibly of Flaubert's Madame Bovary. What Mr. Saintsbury says of the latter will apply here: "A woman who happens to unite strong aspirations after luxury in both senses of the word with a superficial sensibility and utter heartlessness, and an incurable vulgarity of mind."

Mr. Hardy has before this been criticised for putting archaic and obsolete language into the mouths of his humbler characters, but that is a matter between him and philologists. We should like to ask him, however, if it is possible that at the present day manikins of wax are still used for uncanny purposes, even in the remotest parts of England. One very effective scene is made out of such an incident, which is curious, if true, as there is ground to suspect it is not. A map precedes the title-page which neither elucidates the plot nor embellishes the volume.

Keilinschriften und Geschichtsforschung. Ein Beitrag zur monumentalen Geographie, Geschichte und Chronologie der Assyrer. Von

Eberhard Schrader. Mit einer Karte. Pp. viii. 556. (Giessen : 1878 ; New York : B. Westermann & Co.)—In France Halévy and in Germany Gutschmid are the representatives of the persistent scepticism about the trustworthiness of the results reached by the translators of the cuneiform inscriptions. In the early decipherment the chief labor was unfortunately declined by distinguished Oriental scholars, and was taken up by younger men who lacked the reputation which would command respect. The inevitable blunders and contradictions, and too often the rash and baseless conclusions, of Fox-Talbot, Oppert, and Ménant, not to speak of Hincks, Norris, and Rawlinson, seemed to excuse long distrust, and these pioneers and their pupils heard so long the question, Have any of the Hebraists and Semitists believed in it ? that they have become sensitive even to reasonable criticism. Halévy's challenge of the existence even of the "Accad" language was not reasonable, but Professor Gutschmid's 'Neue Beiträge' was properly conceived and skilfully executed. It marked a retreat on the part of the assailants of Assyriology, inasmuch as it admitted the general conclusions of the Assyrian scholars, but charged them, and especially the German scholar, Schrader, with numerous errors, and misreadings, and critical misjudgments. That many errors had been made might have been safely granted ; but Dr. Schrader in his new work has taken pains to reply in five hundred and fifty pages to Gutschmid's one hundred and fifty, and has presented us with a volume of personal defence and attack which is nearly as miscellaneous as a cyclopædia in its character. Having the advantage over Gutschmid of great familiarity with the cuneiform texts, he has been able to defend himself generally with success against the misapprehensions of his critic, but he has not done this in a spirit which is commendable. His interrogations, and exclamations, and "spaced" words, and *literæ majusculæ*, and affected contempt for the statements of his adversary become wearisome enough. The great merit of the work, however, is in its geographical investigations. It is the best source of information as to the position of the lands of the Muski (Meshech), Tabal (Tubal), Nairi, Patin, the Chatti (Hittites), and Kummukh (Commagene), as discoverable by collation of the historical inscriptions. Another especially valuable portion is the discussion of the question, Who was Pul, King of Assyria ? It is satisfactory to find that Schrader does not admit any such violent break in the eponym chronology of Assyria as Oppert assumes, but accepts the plain statements of Jewish and Assyrian writers, and decides that King Pul, if such a king existed at all, must have been identical with Tiglath-Pileser. Although it presents its own chronological difficulties, this theory, which supposes the Biblical Pul of Assyria, the Chaldean Phulus of Alexander Polyhistor, the Babylonian Porus of the Ptolemaic Canon, to be the original and popular name of the officer who, on taking violent possession of the throne, assumed the official name of Tuklat-habal-asar (Tiglath-Pileser), certainly is much more probable than that of George Smith, which requires us to duplicate the names of half a dozen kings of Israel and Damascus, or that of Oppert, which violently interjects half a century into the canon.

The Emerson Steel Portrait.

"The portrait [by Rowse, in crayon ; considered the best portrait of Emerson in his prime] is a remarkable likeness, and happily renders the sweetness and serenity of expression which are characteristic of Mr. Emerson. Mr. Schoff's engraving reproduces all the essential qualities of expression and treatment in the original with surprising fidelity. It is a sympathetic, and not a merely mechanical, piece of work ; and it evinces a power of drawing, and a feeling for subtle qualities of form and light and shade, which are most rare among modern engravers. The quality of the well-defined ye softly-melting edge in the contours of the face seems really wonderful, and the sureness and economy of line and touch by which the total result is reached entitle the work to rank among very uncommon achievements."—*The Nation, January 2, 1879.*

"I think the work one of very remarkable excellence. I have seen no recent piece of portraiture so good, and I believe the engraving will hold place among the best-engraved portraits."—*Professor Charles E. Norton.*

Proof-impressions of the Engraving (price $10) may be obtained direct from the engraver, Mr. S. A. SCHOFF, Newtonville, Mass., or may be ordered through any dealer in prints in the United States.

BOOKS, NEW AND OLD.

The Nation.

NEW YORK, THURSDAY, MARCH 6, 1879.

The Week.

THE President has vetoed the Chinese Bill on grounds to which the "Hoodlums" of California can take no exception. He gives a brief summary of our negotiations with China since 1859, and cites *in extenso* the fifth and sixth articles of the Burlingame Treaty, making mutual provision for emigration, residence, and travel; acknowledges that the experience of the Californians as to the working of the Treaty may indicate the need of some revision of it, and that anyhow "the very grave discontent of the people of the Pacific States with the present working of Chinese immigration, and their still graver apprehensions therefrom in the future, deserve the most serious attention of the people of the whole country, and a solicitous interest on the part of Congress and the Executive." He points out, however, very tersely, that while it is undeniable that Congress has the power to abrogate a treaty, it is no less clear that the power of amending a treaty or making a new one rests exclusively with the President and Senate. This bill does not abrogate a treaty; it seeks to amend it by denouncing one provision in it, and its passage, therefore, he holds is beyond Congressional competence. Taking the other view, that a denunciation of this one provision is practically a denunciation of the whole treaty, he holds that there is no such urgency in the matter as to call for action that would suddenly put our citizens now in China in peril, and might entail an interruption of our commercial relations. He accordingly withholds his signature.

The Forty-fifth Congress expired on Tuesday, with the Army Appropriation Bill and the Legislative, Executive, and Judicial Appropriation Bill unpassed, and the President has accordingly convened the new Congress for the 18th instant. The deadlock was nominally over three issues—viz., in the Army Bill the prohibition of the presence of troops at polling places; and in the Legislative Bill the repeal of the Southern jurors' test-oath and of the provision for United States supervisors of elections. Really, however, the Republicans, in spite of their well-founded objection to new legislation being attached to appropriation bills, would have yielded the first two points if the Democrats had abandoned their traditional policy of opposing every safeguard to honest suffrage. The latter refused to budge, and rejected a proposition to continue for six months the appropriations of the present fiscal year for the Army and the three Government branches.

The Census Bill has been passed with amendments calling for statistics of the ownership of the public debt, and for the financial condition in minute detail of railroad, telegraph, and insurance companies. The Sugar Bill was withdrawn, the Geneva Award Bill shelved. The House so emphatically repudiated the Roach subsidy (159 to 89) that the Senate was obliged to recede. The vote on the Anti-Chinese Bill after the veto was 109 yeas to 95 nays, so that the veto was sustained. The Arrears of Pensions Appropriations Bill was threatened with an extension of the pension law of March 9, 1878 (relating to the soldiers of the War of 1812), to the soldiers and sailors of the Mexican War, but the thought of Jefferson Davis becoming a pensioner was too much for endurance.

Considering the state of the public business the debate in the Senate on Jefferson Davis was more than ridiculous, though, if one were to judge from the Washington letters of some of the newspapers, it afforded immense relief to the people of the United States. General Shields's proposal to aggravate the evils of the Arrears of Pensions Bill by making it cover soldiers of the Mexican War was simply an ebullition of "good fellowship," which ought to have been dismissed without debate. But Jefferson Davis had to be excluded from its benefits; so there arose with great solemnity a discussion of his career, which sounded very much as if he had recently come before the public, and was a lusty young fellow who was likely to make trouble, and in the course of which Senator Blaine intimated that if Senator Thurman were not so old he would inflict corporal punishment on him. The language used about Davis was too mild to please William E. Chandler, who was in the gallery, so he sent down a taunting message to that effect to the elder Chandler, daring him to call Davis some fresh "names." The elder Chandler then rose and abused him savagely, declaring that "every man, woman, and child at the North believed him to be a double-dyed traitor." But, if so, what was the use of impeding business by talking about him?

The people who had their doors studded with big nails, and had their walls loopholed for musketry, when the Potter Committee was appointed, in expectation of a "revolution" which would desolate every school district in the country, as we were assured by one authority, will have been relieved before this reaches them by finding that it has all ended, as we assured them it would, in a huge campaign document. The majority of the committee has reported without any loss of life, and without producing the smallest effect on the stock market. The Report is written by the chairman, and differs from most of its kind in the exceeding sobriety of its tone.

The Report shows that in Florida the Canvassing Board was invested with purely clerical functions, and therefore exceeded its powers when it rejected from the returns a portion of the votes cast; and that it purposely withheld its announcement until the morning when the electors were to meet and vote, so that no time was allowed for effectual appeal to the Supreme Court, which afterwards ordered a re-canvass on behalf of the Democratic candidate for governor. Inasmuch as this wrong might be perpetrated in any State, the Committee recommend a law to meet a similar emergency. In the case of Louisiana, it shows what an anomalous power the Returning Board had over elections, and rehearses the steps which it took to justify its predetermined partisan action. These were, the persistent assumption that the color-line was the party-line in the State contests; a fraudulent census, producing 25,000 more black voters than white, and deriving nearly 25,000 voters from the 57,000 colored men, women, and children in New Orleans alone; a correspondingly fraudulent registration; and instructions to parish supervisors to "return the votes according to the census." It is further shown that the Board, having no authority to discard votes when the returns were unaccompanied by protests about intimidation, etc., and being aware that none such were made at the election of 1876, selected at pleasure Democratic parishes to throw out, and procured protests from them; that in order to make sure of pretexts they instructed the Republicans of East Feliciana to abstain from the polls, and thus afford *prima-facie* evidence of intimidation, and that supplementary protests of violence were obtained of Anderson and Weber, although there was no disturbance of the peace whatever; that evidence in regard to these protests was sought at the expense of the United States Government from ignorant negroes brought down from the interior, whose affidavits being written down for them, their marks were affixed and they sent home with fees, and that the mass of this testimony was so great that the Board could not possibly have considered or read it before their decision was reached. The Report also recites the well-known facts of the forged electoral certificates from Louisiana, replacing the defective original certificates. It concludes that Tilden was elected in Louisiana by a clear majority of seven thousand votes, which had passed the scrutiny of hostile Republican registrars and commissioners; that intimidation is disproved "by the undisputed fact that the vote was larger in proportion to the population than at any previous election ever held in the same State"; that the

Board were encouraged and sustained by the "visiting statesmen," who "pronounced the warmest encomiums" upon them, although bearing "characters notoriously bad," and doubtless promised them protection and reward, both of which have been accorded; and that the same propositions *mutatis mutandis* are applicable to Florida, where "the fraud was aggravated," and was denounced by all the departments of the Government. Mr. Tilden is exonerated from complicity with the cipher despatches. The Report includes a list of the persons connected both with the Florida and Louisiana elections who have been appointed to Federal offices.

The minority compliment Mr. Potter for his liberal rulings; assert that Tilden's denial of Pelton's corrupt negotiations "could not for a moment be entertained by candid men," and that there is no evidence that the members either of the South Carolina or Florida Returning Boards were corruptible. They say that "in Florida the face of the returns gave but 91 majority to Mr. Tilden on their most favorable construction"; that the mode of canvassing contended for by their Democratic colleagues would have given the Hayes electors 40 majority, while that imposed by the Supreme Court would have given them 200, and "purging the county returns of fraud," as the Democratic Attorney-General advised, 900 majority. They complain that they were outvoted on the question of inquiring into the alleged frauds at the ballot-box in Florida, to which assent was refused. Of Louisiana they have but little to say except in reference to the Sherman letter: they think the Committee ought to have been unanimous in exculpating Mr. Sherman. In short, the two reports afford little help to a judgment, since they avoid direct issues, and there is no proportion in the stress they lay on the same topics.

According to the majority report of the Teller Committee, which was laid before the Senate on Thursday, the elections last year in South Carolina were distinguished by the general use of tissue ballots, which extended to every county but one. In Louisiana the spirit of lawlessness took the form of murder, of which it is said there were between thirty and forty cases. Freedom of speech on political or social questions was suppressed by the Democrats, on the ground that the discussion of such subjects had an incendiary effect and tended to create ill-feeling and animosity between the races, and endangered the public peace. In spite of the pretence that the outrages committed by whites on the negroes were always caused by threats made by the latter, the witnesses were obliged to confess that the disposition of the colored people was peaceful and law-abiding, and that the whites had never had any reason to fear them. In several districts in both States the elections for Congressmen and for State and county officers were governed by violence and fraud. The laws of South Carolina and Louisiana are amply sufficient for the protection of citizens in their rights, but no effort was made to enforce them. The Committee have asked and obtained leave to sit during the recess and take further testimony.

Recent developments regarding two or three of our life insurance companies would seem to close the case against State supervision "as conducted in the State of New York," so that a disinterested jury would give a verdict without leaving their seats. In the case of the Globe Mutual (mutual as far as the President's family is concerned) the protecting ægis of the Insurance Department seems to have been converted into a screen to hide the officers' irregularities from the outraged policy-holders. The company was examined last year by Deputy-Superintendent McCall, whose ability and integrity have never been questioned, and an elaborate report made to his superior officer in May, which was "pocketed" by the Superintendent, and has only now been brought to light on the peremptory demand of the Assembly. This report sets forth in detail the "building-loans" and other investments of the company, and Mr. McCall's comment upon this department of the business is, that "there has never been on exhibition, in the history of any trust institution of the State of New York, a record so thoroughly to be condemned as that presented in the real-estate loans of this company." The balance-sheet of the company, as adjusted by Mr. McCall, showed a deficit as respects policy-holders of $378,739 19, or as respects stockholders of $478,739 19, the capital stock being $100,000.

There have been two singular college rows during the week, and both in institutions to which young men are attracted largely by their religious influences. At Trinity College, Hartford, the whole of the undergraduates, with one or two exceptions, rose in revolt against the college authorities and went through some "exercises" of a festive character in a hired room in the city, at which they recited poems which they had been forbidden to recite without previous submission to college censure. The result was that the unfortunate parents of the mutineers were summoned from their homes in dreadful weather by telegraph in order to quell the disorder, and were naturally indignant on discovering the nature of the crisis. Their intervention resulted in the passage of two buncombe resolutions—one by the students, acknowledging they had made a mistake, and the other by the Faculty, agreeing to overlook the matter. The second row actually occurred in an Episcopal theological seminary in which young men are trained for the ministry, near Poughkeepsie, in this State. Some of them went on a sleighing party and afterwards had a supper, at which several got drunk. Subsequently, another student, through whom the affair reached the knowledge of the Faculty, was put under a pump. Then there was a "free fight," in which chairs were used; then there was a secession of a large number because others were not expelled, in spite of the advice of the Faculty to forget the past and apply themselves to their studies with renewed vigor. When one considers that these gentlemen are actually preparing to be teachers of religion, and are presumably of tolerably mature age, the willingness of the Faculty to do another day's work on them strikes one as rather odd. It is difficult to believe that any body of professors, however able, could truly prepare them for orders within any reasonable period.

Archbishop Purcell's liabilities now appear to amount to $6,000,000, and the number of his unfortunate depositors to 11,000, of whom many have at last lost their temper and have begun suits against him. The affair has clearly passed beyond the control of his friends and even of the Church, which already finds it hard to make ends meet. To crown all, he appears to have kept no regular accounts, and to have but little knowledge of what he did with the money, though of course none of it was applied to his personal use—the celibacy of the clergy being a strong protection against abuses of this kind. The whole affair is a curious example of the working in an intensely commercial society of the reverence for authority, and especially ecclesiastical authority, which grew up in poor agricultural communities. Irish and German peasants, naturally enough, carry their scanty savings to the priest for safe keeping; the habit has been kept up in Ohio, and, as might have been expected, has resulted in a bankruptcy almost equal in size to Strousberg's.

The subscriptions to the United States 4 per cents. fell off during the week, and no further calls for the redemption of 5.20 6 per cents. have been issued. Sterling exchange has advanced to the specie-exporting point; at least, the nominal rates are fully up to that point, and the actual rates are very close to it. This rise was not unexpected, as the sales of 4 per cent. bonds in Europe have not been sufficient to counterbalance the amount of United States 5.20 bonds called home for redemption and railroad securities sent here because of the high prices now current at New York. Money continues abundant in the loan market notwithstanding the great number of securities taken back from Europe, and the Province of Quebec has brought out a loan for $3,000,000 in New York rather than take it to London. This is the first foreign loan ever offered in New York, and it is remarkable that a borrowing nation should have so impressed the world with its "money power" that it is now asked to lend to its neighbors. The New York banks have suffered

a further reduction in their reserves on account of payments into the Treasury. As the Treasury has the power to put any part of its balance in national bank depositories the loss is not regarded as of the same importance as it would otherwise be. Silver has been steady during the week. The price in London has stood at 49½*d.* per oz.; the bullion value here for the 412½-grain dollar has ruled at $0.8391 to $0.8353.

The more is known about the late disaster to the British troops in Zulu-land the more unpleasant it appears. The causes of the war have been set forth in a memorandum by Sir Bartle Frere, who is the High Commissioner on the spot, in an elaborate memorandum, and, though the list includes some violations of British territory and other small outrages, the real one is the impossibility of permitting a savage chief to maintain a disciplined and well-armed force of 40,000 men on the borders of a peaceful agricultural and thinly-settled colony. In other words, it had become necessary to break up Cetewayo's army and bring him into a state of harmless subordination, and any excuses that offered themselves were seized on for this purpose. He was accordingly ordered to disarm and make his submission, on pain of military execution, and Sir Bartle and Lord Chelmsford, the general in command, chose their own time for the attack, and accordingly cannot plead surprise or unreadiness. Lord Chelmsford had 10,000 men under his orders—a force considered amply sufficient, for 450 Dutch farmers of the Transvaal have before now defeated 12,000 Zulus in a pitched battle. He however, divided his forces, advanced himself into the enemy's territory to reconnoitre at the head of one column, leaving another at his camp twelve miles away. It now appears that so defective was his scouting that an army of 20,000 men actually got in his rear, and overwhelmed the second column, and detached five thousand men to assail the small party of one hundred men left to guard the ford over the Tugela River, which constituted his sole line of retreat. But for the obstinate defence of the little garrison, which held its own for twelve hours, inflicting enormous loss on the enemy, he, too, would have been cut off and surrounded, and probably have shared the fate of his subordinate, Major Durnford. The Zulu tactics were, moreover, well known, and resemble those of our own Indians in the old days of forest fighting. They push round on both wings through the thick African bush, and when the circle is completed open fire, and at the last charge with long knives. There is nothing for it now but to finish Cetewayo's army, which, owing to the difficult nature of the country, is going to be a long and expensive job.

Troops are being hurried to the scene of action from all parts of the Empire, including India and the Mauritius, but the smallness of the force which can be spared throws curious light on the theatrical performance of threatening Russia in Turkey with the Sepoy army. The little war in Afghanistan with the barbarous levies, who have not yet mustered courage to fight a battle in the open, has tasked the resources of India both in men and money so severely that if Yakub Khan, who has now succeeded his deceased father, Shir Ali, continues the conflict, and Russia were to choose to play any more tricks in Turkey, it is not England who could bring her to reason. In fact, great fears begin to be felt among the Jingoes that Cetewayo may after all be the means of destroying the division of Bulgaria on which Lord Beaconsfield plumed himself as the happiest stroke of his policy. The hostility of the people of Eastern Rumelia to the separation continues to be intense, and there is no doubt of its being fomented by Russia. There is much likelihood, too, that the entrance of the Turks will be resisted forcibly, or will be followed by insurrectionary outbreaks, which will finally compel the armed intervention of the Powers, and the abandonment of the Jingo experiment. The news of the South African defeat, therefore, was terribly unwelcome to the Ministry, coming as it did at the opening of Parliament, and all the more because it crushes the Chancellor of the Exchequer's plan for distributing the expenses of the preparations for fighting Russia over three years, instead of paying them out of the taxes of the current vear. He was warned at the time by the Liberals that he could not in this way count upon the future, and the event has justified them.

Affairs in France have taken a turn for the worse, and the Waddington Ministry seems already tottering to its fall. Waddington himself is hardly the kind of man for his place. He is a cold, bluff manufacturer, whom Gambetta dislikes, partly instinctively and partly for cause, as he was supposed to have interfered to prevent Gambetta's meeting socially some of the royal personages who were in Paris at the Exposition, and President Grévy is said to have accepted him on Dufaure's resignation rather as a stop-gap than because he liked him. He was hardly in office before a fierce attack was made on the Paris police by a series of accusations in a Radical paper, the *Lanterne*, that compelled enquiry, which did not sustain all the charges, but revealed much that was very damaging, and furnished the extreme Left with plenty of ammunition. This forced M. Marcère, the Minister of the Interior, either to choose between surrendering all his subordinates to the Radicals, or standing by them, and the attack on him has been so fierce that he has had to resign. Close on this comes a charge against M. Léon Say, the Minister of Finance, of having used his official knowledge to speculate on the Bourse. He is an old clerk of the Rothschilds, and has been concerned with them in many financial operations, and is already very wealthy. The conversion of the five per cent. Rentes into three or four per cents would be easy, and has been long talked of, but is opposed by the Radicals because the bonds are largely held by the peasantry. But the talk of it and the reference of it to a Committee of the Assembly had lowered their price of late greatly, and while low the Rothschilds appear to have bought them heavily, it is alleged on the strength of the information furnished by M. Say to a syndicate of brokers that the Committee would report against the conversion. The resulting outcry is so fierce that at this writing it is supposed that he also will have to resign. It is hardly possible that after this the Ministry could hold together very long.

The Turks and Russians have at last concluded a definitive treaty of peace, which leaves the provisions of the Treaty of San Stefano standing except in so far as they have been modified by the Treaty of Berlin. The indemnity in money is fixed at $160,000,000, but no time or mode of payment is fixed, and to this is to be added compensation to Russian subjects for losses suffered during the war, not to exceed $5,000,000, and the cost of maintaining the prisoners of war. It will be seen that the indemnity, although the existing public debt takes precedence of it, gives Russia a potent means of annoyance. The evacuation of the territory began almost immediately after the ratification, and is probably by this time all but complete. The Montenegrins have come into possession, after long delay, of Spuz and Podgoritza, but the Porte still refuses on one pretext or another to negotiate with the Greeks on the basis prescribed by the Treaty of Berlin, and France has at last informed the Government at Athens that she will formally request the Porte to do so, and in case of refusal herself appeal to the Powers. A Frenchman, M. de Tocqueville, has a scheme on foot for a readjustment of the public debt on the basis of a new loan from the present creditors, but nobody believes it will succeed, although the Turks are of course willing to promise anything in order to get hold of the money.

The consideration of Prussia's steady support of Austria on the Eastern Question appears in the now publicly announced revision of the Treaty of Prague, by the fifth article of which Austria reserved to the inhabitants of Northern Schleswig-Holstein the right at a suitable time to declare by popular vote whether they would be annexed to Germany or restored to Denmark. Bismarck has, of course, carefully abstained from permitting the exercise of any such right, and he has now obtained from Austria, by a new Treaty, a formal abrogation of the provision, so that the understanding between the two empires appears to be perfect. It is rumored that Austria also secures by this German support or connivance for any moves she may hereafter find it necessary to take in the direction of Salonica.

SOME NOTEWORTHY FACTS ABOUT THE LATE CONGRESS.

THE difficulty, to which we have often called attention of late, of finding out, by observation of the proceedings in Congress, what is a Republican and what a Democrat—or, in other words, what is the nature of the line that divides the two great parties which every two years contend for the control of the Government—has not been by any means diminished by the course of the Congress which ended its existence on Tuesday. In fact, the history of its votes and debates makes it seem more and more likely that the next Presidential election will turn on the comparative personal merits or demerits of the candidates. For many years after the foundation of the Government—indeed, down to the outbreak of the war—parties were divided, roughly, it is true, but still with sufficient distinctness to enable one to predict the ground they would take on most Federal questions, by their manner of interpreting the Constitution, whether loosely or strictly. If either Democrats or Republicans of to-day inherited the traditions of their political ancestors, we should be able to say with certainty what course either party would pursue with regard to the paper-money question, the silver question, the pension question, the Chinese question, and the army question, or any other question which has been prominently before the public during the last two years. As a matter of fact, nothing in the history of parties would have foreshadowed any important vote of the late Congress.

It found resumption on a certain day provided for by its predecessor, but it had no sooner met than desperate attempts to repeal the Act were made, which were supported by large bodies of both Republicans and Democrats, the only difference being that the Democrats contributed the larger contingent to the attack, and the credit of defeating it was in like manner shared by both. Efforts to revive the income tax and revise the tariff were supported and defeated, in like manner, by votes drawn from both sides indiscriminately, with little or no regard to party platforms. The Silver Bill was passed by an overwhelming majority of both parties, though its avowed object—the inflation of the currency and the cheating of the public creditor—was one against which the Republicans were solemnly pledged. The Bankrupt Law was repealed also by an indiscriminate vote. The Electoral Count Bill, introduced by Mr. Edmunds, was passed in the Senate by the aid of Democratic votes, but in the House neither side has deigned to pay much attention to it, and the time for calm legislation on the subject may be said now to have all but passed by. Both sides profess to be in favor of strict economy, but both joined in passing by overwhelming majorities the Arrears of Pensions Bill, the Democrats indifferent to the fact that it takes $27,000,000 out of the Treasury, and the Republicans to the fact that it may give the inflationists a weapon to use against the permanence of resumption. The payment of the Fisheries Award was opposed by Republicans and supported by Democrats without any reference, apparently, to party traditions or associations. Strangest of all, the Chinese Bill, which seemed to be more distinctly than any measure which has come before Congress in recent times hostile to the fundamental principles of the Republicans, was passed by a powerful combination of both parties, the leader in its support being the noisiest Republican agitator now to be found in public life. It is not surprising, in view of all these things, that neither party should have steadily supported or opposed the Administration. It has been helped and hindered by both indiscriminately, it would be hard to say with what view or by what rule. Its bitterest assailants have sometimes been Republicans who were moving heaven and earth to elect Mr. Hayes in 1876, as a person who would go far to regenerate American society, and its warmest supporters have sometimes been Democrats who have denounced it as the product of the blackest fraud of "this or any other age."

All this promises to make the task of the conscientious or independent voter a very troublesome one in 1880. Looseness of opinion on all questions except the condition of the South—or, in other words, the only great question of the day which seems beyond the reach of specific legislation—has been deliberately fostered on the Republican side during the whole session, and the Democrats have on their part avoided any attempt to deal with Southern troubles beyond removing any hindrances which Republican legislation may have placed in the way of white supremacy. There has not been on either side the sign of an honest attempt to reach a solid and lasting solution of a problem which is fast becoming the reproach of American politics. Nearly everything that has been said or done with this air, or apparent design, has been really a device for entrapping the enemy into some damaging vote or admission.

The plain truth is that there is no honesty in accepting, as most Democrats profess to do, negro suffrage at the South as a lawful fact, and then professing to see no necessity for any extraordinary police measures for its protection. Everybody knows that negroes have and will have extraordinary difficulty in exercising their legal right, and that the State governments are not likely to protect them in it efficiently, and that it is a piece of self-stultification for Congress to repudiate all responsibility in the matter, at least so far as the enforcement of order at the polls at Federal elections goes. Any Democrat who denies all this ought in decency to advocate the disfranchisement of the negro. The objections made to the use of soldiers at the polls may be well founded, though as long as there is no other Federal police we do not think they are. But what is the objection to supervisors of election chosen from both parties? Where is the danger to popular liberty or State rights in this? If, also, the great difficulty of the Southern question lies, as we believe it does, in the fact that the Federal Government always appears on the scene, not as a peacemaker or arbiter but as a fierce partisan, eager for the triumph of one party, why do we see no Democratic proposal looking to the abatement of this evil, except one which is based on the utterly false assumption that there is no more need now for Federal interference at all than there was before the war? Those who are laboring for the repeal of what they consider the unconstitutional legislation framed by the Republican party during and since the war, cannot face the country without making some other provision for the new state of things introduced by the war, the most important feature of which is the appearance of a body of voters without sufficient moral and physical force for their own protection. If the Democrats suppose that the country will be satisfied without some attempt on their part to deal with this problem, they make a huge mistake. They will be pursued from election to election with stories of fraud and outrage, which will prevent their ever obtaining a sure hold on power, because it will keep the humane feeling of the North, which is after all the most permanent force in American politics, constantly arrayed against them.

Of civil-service reform the Republicans, after having used it in their platform to elect their candidate, have shown themselves bitter and determined enemies, and there is something odd in the fact that the candidate himself, who was elected as its champion, has managed within two years to make the thing and its advocates more or less ridiculous. He has not only recommended no legislation in aid of it, but has exemplified most of the evils of the old system in his practice.

One thing must be said of the late Congress in the way of praise, and it will cover a good many sins. It has been answerable for few or no jobs, or votes of public money in aid of private ventures. Its worst acts have had at least a flavor of public spirit. The lobby has never since the war been less powerful or less successful, or Washington society and municipal government freer from the odor of corruption. For this, too, the President and Cabinet are entitled to a large share of praise, and it ought to be heartily given. No matter what may be said of them, it cannot be said that they have, directly or indirectly, supported or countenanced any disreputable scheme, or that any doubtful person has been able to boast their friendship or connivance in getting money out of the Federal or city treasury.

THE PROTECTIONIST REVIVAL IN EUROPE.

THE demand for protection for native industry in France and Germany, and even England, in all of which the doctrines of free-trade were supposed to have secured a firm footing during the last fifteen years, is interesting for the light it throws on the reasons which make protection popular in the strict sense of the term. That protection *is* popular there is no sort of doubt. In every country in which the opinion of the masses exerts a strong influence on fiscal legislation—that is, in which this legislation is not left in the hands of the economical experts—it constantly tends to become protectionist. The exception to this rule furnished by England is only apparent, because there the battle between free-trade and protection was fought over the food question, and the protectionist presented himself in the character which he has never assumed anywhere else—of a person interested in making the poor man's bread dear. The illustration which this afforded enabled Cobden and Bright and their friends to obtain a hearing and acceptance for the free-trade argument which probably could not have been secured in any other way, and which made the overthrow of the high duties on all other commodities as well as on grain a comparatively easy matter. Such success as free-trade has secured on the Continent was the result, in part, of the success of the English experiment, and in part of the great improvement in international communication. The manufacturing and commercial prosperity of England increased in a marvellous ratio after 1850, and it impressed the Continental imagination sufficiently to produce a leaning towards free-trade among the politicians and in the press, which resulted not in any general or fundamental revision of the tariffs but in the making of a number of treaties of commerce, providing for what is called the system of "reciprocity"; or, in other words, the admission of certain specified products at low rates of duty in return for the admission at low rates of certain other specified products. As regards any nations with which these treaties did not exist the old high tariffs remained in operation. The most liberal of these treaties was that which was concluded with England by the Emperor Napoleon through the negotiations of M. Chevalier and Mr. Cobden. The result, as shown in the growth of imports and exports and of national savings, has been something marvellous in France also. In fact, no higher evidence of the fiscal wisdom of the Emperor's policy could be offered than the ease with which the French people bore eleven years later the huge burdens imposed on them by the German war. Besides the stimulus to unfettered commercial intercourse given by these examples, the great growth of travel and of means of quick transportation within twenty years has, by bringing foreign markets near, given them an attractiveness which, in the days before steam, they could not have had, and has helped to break down the idea on which the whole protective doctrine may be said to rest, that trading across political lines is likely to be more hurtful (or less profitable) than trading within them.

Nevertheless, in spite of all this apparently successful working of the free-trade theory, it has at this moment fallen into discredit, not only on the Continent but in England, where it was first preached, and where, for the last thirty years, it has almost held the place of a new gospel. In Germany and France there is an outcry against it, and a marked disposition to abandon the treaties of commerce and enforce the rule of reciprocity through the tariff. This tendency shows itself, too, at a moment when the zeal for improved means of intercourse—for more railroads, more tunnels, and swifter steamers—is stronger than ever before. Every country in which this protectionist revival has appeared is suffering from great commercial depression, but this depression is almost the only thing they all have in common. Each one of them has reached the commercial depression through a totally different path. Germany has reached it after a prodigious and sudden addition to her pecuniary wealth following on a short and successful war; France, through a destructive and unsuccessful war, and a political revolution; Italy, through a long period of political turmoil and grinding taxation; and England, after ten years of prodigious commercial activity and prosperity. In fact, it would be difficult to mention a single circumstance of importance in the economical antecedents of these countries which any two of them have in common. They have had different tariffs, different social and political organizations, different recent political history, different systems of taxation, different amounts of taxation, different monetary and banking systems. The only thing they have in common now is the prevalence of commercial distress. Nevertheless, the remedy called for in all, by those who think the Government can apply a remedy, is the same—namely, a return to protection or an increase of protection.

The United States has gone through five years of depression also after twelve years' experience of a highly protective tariff, the only difference between our condition and that of European countries being that our troubles began a year or two sooner. They are not yet by any means at an end, though the end is apparently near at hand. The number of failures last year was greater than ever, but our exportations of breadstuffs and cattle, and cheese and butter, having been recently very great, people are disposed to forget totally the panic and its consequences, and have begun to point to the fact that we have any trade at all as a signal vindication of the protectionist policy pursued since the war, and as good reason for asking whether we should not be the better of a little more protection.

This general cry of all sorts of patients for the one medicine explains why it is that protection is popular in all popularly governed communities. It is emphatically the remedy of "plain people," who do not carry their enquiries very far or remember very long. To every man who earns his bread in any trade or calling the great difficulty of his life is to find a market for his wares, and two-thirds of his mental force is expended first on finding it, and then on keeping other people in the same pursuit from sharing it with him. In fact, if fortune places it in his power to create a monopoly for himself, there is not one in a thousand who will refuse to do it. No amount of argument will persuade a grocer that it would be well to open two more grocery stores in the same street, or a stage-owner that there ought to be another line on his route. When times get bad with a dealer, no matter from what cause, the form in which the badness presents itself to him is in the shape of falling prices, or excessive supply of his own commodity. The remedy is, therefore, suggested by the disease, and it consists in getting down the supply by shutting out from the markets some of the rival producers. He cannot resort to this remedy in these days as against his own countrymen, but it remains in his head as a good thing to use against those who have no legal or moral claims on his forbearance, and when the opportunity offers itself, he turns the weapon of exclusion unhesitatingly against foreigners. No simpler mode of recovery, or one needing less time for its operation, occurs to him, and the fact that even in England it should have secured a powerful hold on the popular mind in the very first protracted crisis since the policy of free-trade was resorted to, shows what a *natural* mode of recovery it really is.

THE BIRMINGHAM CAUCUS.

BIRMINGHAM, February 9, 1879.

A VERY common subject of political discussion in England has of late been what is called the "Birmingham Caucus"—an institution the chief defender and expounder, if not the actual founder, of which is Mr. Joseph Chamberlain, late mayor and now member of Parliament for Birmingham. This political organization, which was intended to consolidate Liberalism in Birmingham and ensure its triumph at the general as well as the local elections, is not properly a "caucus," but is based on the same principles which govern the ward committees and primary elections in America. The selection of candidates for election in English towns and boroughs had previously been left entirely, or almost entirely, to local self-appointed committees consisting chiefly of men who had subscribed to the political cause, or in the hands of the leading political clubs in London, such as the Reform and the Carlton. An institution like that which is now established at Birmingham, with its primary and secondary elections, naturally causes a great deal of dissatisfaction on the

part of many Liberals as well as Conservatives. Mr. Gladstone has lately become known as the defender of the organization, on the ground that, in his opinion, it seems to be the only method of sufficiently consolidating the Liberal party, of preventing "splits" at elections, and of preventing the return of a Conservative candidate who is really in a minority. Lord Hartington, in his Liverpool speech, has taken the same view. Others, such as Mr. W. E. Forster, and notably Sir W. Harcourt, are as strongly opposed to the "caucus" system, on the ground of its destroying independence of thought, of its crushing out divergencies in Liberal opinions, of its turning members of Parliament into mere mouthpieces of their constituencies, and lest it may, in the course of time, be converted into a mere "machine" and fall into the hands of men who will use it simply for their own private ends. The chief objections to the organization were fully stated by Mr. E. D. J. Wilson in an article in the *Nineteenth Century* for October, 1878, which was answered by Mr. Chamberlain in the *Fortnightly Review* for November. Since then there has been considerable discussion in the daily and weekly press; and the subject is becoming even more prominent from the refusal of Mr. Forster, the present member for Bradford, to submit his claims at the next general election to what is called the "Three Hundred" of that borough, on the understanding, of course, that should they choose to reject him he would be bound in honor not to present himself to the constituency. Since then a meeting of what may be called a competitive examination of candidates has been held, by a similarly constituted body, in the borough of Southwark. Over one hundred towns and boroughs in England have now adopted the Birmingham scheme, known in various places as the "Two Hundred," the "Four Hundred," and the "Five Hundred," and, about a year ago, they formed themselves into the "National Federation of Liberal Associations" (of which Mr. Chamberlain is the president), for the purpose of organizing the Liberal party throughout the country, and naturally, through this organization, of influencing parliamentary representation and parliamentary members.

It may be interesting, therefore, to consider exactly how the Liberal Association, or the "Six Hundred," of Birmingham, is constituted. Now that the institution is in running order, the general method of procedure is as follows: Once a year the Liberal Association summons, in each of the sixteen wards, a meeting of the Liberals of that ward. Every person calling or choosing to consider himself a Liberal—no matter whether he is a member of any one of the committees, or whether or not he pays the minimum contribution of a shilling a year—is allowed to attend. This meeting elects large ward committees of indeterminate number, with a chairman and secretary. It also elects five members of the Executive Committee, two of whom must be chairman and secretary of their ward, all five becoming members of the General Committee. It then elects thirty other members of the General Committee. These would make an executive committee for the whole of Birmingham of eighty members, and a general committee of 560. An attempt, however, is made to combine local representation, in its strict sense, with the representation by men of character and influence, not resident in the district, as heretofore practised in England. For this purpose the executive committee is empowered to select, at its discretion, thirty additional members from the whole of Birmingham, who also form part of the General Committee. Besides these they elect a president, vice-president, treasurer, and secretary, who originally may not have been members of the committee, but who, *ex officio*, become so. In this manner the Executive Committee is increased to 114 members, and the General Committee to 594. The sixteen ward committees number altogether about two thousand men. In addition to the four officers the Executive Committee choose a small Management Sub-committee of seven; and this Sub-committee, it is evident, must in the end rule the whole of the General Committee, although, in extreme cases, its proposals may be set aside. However, when the machine is in full working order, the decisions of the General Committee, and the lists of candidates, will doubtless be prepared by this Sub-committee, and arrangements will be made by the leaders that their decisions shall be always carried into effect. The choice of parliamentary candidates for the borough belongs absolutely to the General Committee. This committee also nominates the candidates for the School Board. Candidates for the municipal offices are selected in each ward by the ward committee, or perhaps really by this Sub-committee of Management; and the General Committee, in every case, undertakes to approve of and aid in carrying out the decisions of the ward committees. It is a rule of the Association to vote for no candidate who has not been proposed or approved by the General Committee; and, also, that every candidate who has submitted his claims for nomination to the committee is in honor bound not to stand if rejected by them. The organization of Liberal committees in other towns is, in all important respects, similar to that of Birmingham.

Now, this organization differs in one very important respect from similar American party combinations, namely, that the members of the committees are elected at fixed times to serve for the whole year. One of the characteristics of the American plan which has caused most harm is that fresh conventions are called for the selection of candidates at each election, and owing to a multiplicity of elections there is also a multiplicity of conventions. Unless, therefore, a man takes a very deep interest in politics, either on the grounds of general good or personal benefit, he is apt to neglect attending the primary meetings. Such conventions accordingly fall far more easily than they would be likely to do with the Birmingham system under the control of a knot of wire-pullers and professional politicians, who select their own delegates for the conventions, and thus present to the public as candidates for office (one of whom must practically be selected) either mere politicians who are seeking office for their own ends, or harmless mediocrities. Of course such a state of things may be conceived as possible under the Birmingham plan; but owing to the general fixed tenure of public offices, and there being no spoils to reward partisans, and owing also to what may be called the greater political conscientiousness which exists in England, such a probability is unlikely to occur, at all events for a long time to come. It is not meant to assert that even now there is no wire-pulling and "packing" of meetings in Birmingham; and it would be difficult to prove that even with all this representative system of primary elections affairs are not really in the hands of half-a-dozen leading men in Birmingham, of whom Mr. Chamberlain is *facile princeps*. So far, however, the efforts of the Liberals have tended towards the public good, and not to their own personal profit or advantage, except in the way of office-holding.

As a party organization the Birmingham Liberal Association has had a great success. The most respectable men of the Liberal party are glad to be members of its committees and take an active part in its proceedings. The discipline to which it has succeeded in attaining among the rank and file of the party is splendid. For several years it has returned an overwhelming number of members to the Town Council, and at the last election carried every man, so that the Town Council is now exclusively Liberal, although one-third of the population of the town is Conservative. For the return of members to the School Board there is a cumulative vote. This School Board consists of fifteen members, and each elector is allowed fifteen votes to distribute as he pleases. By deciding that each Liberal elector shall give five votes for three candidates in each ward the Liberals have succeeded in electing eight members out of a total of fifteen, thus giving them a majority. The Board of Guardians is almost exclusively constituted of Liberals. At the last election for members of Parliament the Association determined to show its power thoroughly, and, what is unusual in England, rejected a sitting member who had given no cause of offence, and nominated and elected a new one, Mr. Joseph Chamberlain. There are three members for the borough, and each elector is allowed two votes, which are not cumulative.

At the same time the effect of the Liberal Association, as has just been seen, has been to introduce national party politics into municipal affairs, a proceeding which is very much commented upon in England, and to which many persons of all shades of opinion—Liberals as well as Conservatives—object. It thus may happen that owing to the excitement attending national politics at the time of the elections of the General Committee—when, *e. g.*, the burning questions as to whether England should support Turkey, or whether the Afghan war is right, are being debated—little more than a bare majority of the Liberals may practically decide who shall fill the municipal offices; that is, that a little more than one-third of the population may rule the town. Of course, every political organization must have its defects, and the present tendency of opinion in England is towards organization. As to its results in Birmingham, it may be mentioned that its School Board has carried out the education laws as liberally as any interpretation would admit of, and has increased the number of pupils at elementary schools from about fifteen thousand, in 1870, to over forty thousand in 1876. This, however, was partly due to the enactments of the law itself. Besides the ordinary business of the town the municipal government has entered on three great transactions which have vastly increased its debt, and which, of late, have been greatly dwelt upon by the Conservative party as arguments against the Liberal party itself, and also against the introduction of national politics into municipal affairs. In 1875, on the proposition of Mr. Chamberlain, then mayor, the corporation resolved to purchase the gas-works. The

debt incurred by this undertaking has been about $10,000,000. The improvement, however, has been very great, through the saving effected by single instead of double management (for there used to be two companies), and by taking up all the extra mains. The area lighted by gas has also been greatly increased, as likewise the number of consumers. The net profit, after paying all expenses and interest for the year 1878, is about $270,000. Of this amount $100,000 has been paid over to the funds of the town towards general expenses, and the remainder set apart for a reserve fund and a sinking fund, with the intention of paying off the debt sooner than the term fixed by act of Parliament. The price of gas has also been reduced in Birmingham to 2*s.* 7*d.* ($0 57) per thousand cubic feet, and is now cheaper than in any other town of England, excepting two—one being Plymouth, where the gas is inferior in quality, and the other Walsall, an outlying district of Birmingham, which had the advantage of purchasing the works at a reduced value from the Birmingham corporation. In the same year (1875) the Corporation took the works of the Birmingham Water-works Company at a cost to the town of £1,400,000 ($7,000,000). The results have been a small annual profit to the town, the use of pure water by the poorer population of the town, and the closing of the old wells, which were infected by sewage matter, thus tending to diminish the death-rate. Besides this, the town of Birmingham was the first to avail itself of the Artisans' Dwellings Improvement Act, by which the corporation has bought, through compulsory sales, a tract of land of about ninety-three acres through the poorest and most thickly-settled part of the town, in which it proposes to lay out new streets and build new houses. It is estimated that the net cost to the town in carrying out this work will be about £500,000 ($2,500,000), although the actual cost, until the lands can be resold, will be far greater. Up to the present time the corporation have only completed a small section of one new street, and have not yet erected any dwellings for the occupancy of artisans.

In spite of its Liberalism, Birmingham is in some respects conservative, and not always awake to new ideas. The fire department is badly managed under the control of the police. Notwithstanding the many new large buildings, some people have thought that fires could not occur, and it was with great difficulty that the corporation was persuaded to purchase one steam fire-engine, which is, however, not allowed to go out until specially sent for. Several large fires recently, especially the burning of the Library, are beginning to open people's eyes.

The taxation for the present year for municipal purposes, including the poor-rate, will be 4¼ shillings in a pound on ratable property of £1,454,328—*i.e.*, 21¼ cents in a dollar. The ratable property is chiefly the income of inhabited houses, and the rates, as elsewhere in England, are paid by the occupier, the law thus protecting the landlords; when their houses are not rented they pay no tax.

Correspondence.

THE SYRACUSE CONFERENCE.

To the Editor of The Nation:

Sir: As you have alluded to my part in the conference of the 14th inst. at Syracuse, in reference to the Oneida Community, will you allow me the use of your types to say that no report of my remarks, even tolerably correct, has appeared in print? I have not cared to follow up the pretended reports in other papers, but the *Nation* is usually so careful, and so free from recklessness in its statements, that I cannot refrain from asking the favor of a correction in its columns.

The word "concupiscence," which the *Nation* also claims was used in proposed amendments to the statutes of the State, was not heard from beginning to end of the proceedings. Might not the well known good sense of the *Nation* have saved it from reiterating a puerility so manifestly the blunder of a misinformed reporter?

Very truly, John W. Mears.

Clinton, N. Y., February 24, 1879.

[We prefaced our remarks on the proceedings with the reservation, "if the brief report of the New York *Times* be correct." From the prominence given it by the editor, we inferred that it had reached him from a trustworthy source, and we may add that the paper generally avoids sensationalism in reporting events at the North. We are sorry, of course, to have even innocently ascribed to any gentleman, lay or professional, the strange plan of dealing with "concupiscence" which Mr. Mears repudiates.—Ed. Nation.]

L'ART'S TREATMENT OF MR. VEDDER.

To the Editor of The Nation:

Sir: In the *Nation* of January 16 is a note relative to the unpleasantness between *L'Art* and Mr. Vedder, in reference to which I would like to say a word, if not too late, the more as I strongly suspect from internal evidence that the laudatory critique of Mr. Vedder's work in the *Nation* was the cause of the most unjust and critically discreditable retaliatory notice in *L'Art*.

In art discussions one must be catholic and not too self-asserting. What differences of opinion may exist between critics are not subjects of close argument, but loosely coherent system, which admits agreement in discord; but the animus of the attack on Mr. Vedder is betrayed by a gross misstatement in matter of fact. The critic asserts that whatever of certain good qualities may be found in the reproduction in the pages of *L'Art* are due to the engraver, not to the original. As the writer of the *Nation's* notice of Vedder's picture, and knowing the picture thoroughly, I beg to be allowed to qualify the statement of *L'Art* as without the slightest justification in fact. I do not trust merely to memory, for I compared the illustration with a photograph from the original picture, and though the former is certainly a creditable and generally spirited reproduction of the design, it fails precisely to render the qualities of delicacy and tenderness in the "Marsyas" which the critic of *L'Art* credits it with supplying.

I am not a personal friend of Mr. Vedder, whom I have only seen once in my life, many years ago; but the case seemed to me such a gross violation of the decencies of criticism that I at once got a copy of the photograph from the "Marsyas" and sent it to the "gérant responsable" of *L'Art*, calling his attention to the violation of the conditions of honest criticism, and asking him to compare it with the illustration and judge. Of course nothing ever came of it, but he should be warned that such criticism will only destroy the influence of his journal. The whole article in which the attack on Vedder appears is full of "appreciations" so evidently shaped by something beside fair critical judgment that I am inclined to say that the writer must fall on one horn of a dilemma, either of which should disqualify him as a critic.

Yours truly, W. J. S.

Florence, Italy, Feb. 13, 1879.

THE QUESTION OF SCHOLARSHIPS.

To the Editor of The Nation:

Sir: Will you permit me to touch very briefly a few of the points discussed in the interesting letter of "T. W. H." on "open" scholarships, published in your last issue?

1. The practice of taking account of character, scholarship, *and need* in giving money aid to students under the various forms of "beneficiary" money, "exhibitions," loans, scholarships, and fellowships has been uniform and unbroken at Harvard for so many generations that the governing boards would probably not feel warranted in offering the income of any of the existing endowments as prize-money for competitions in scholarship alone. The nature of the endowments, not the action of the University authorities, has fixed this practice. Unless the founder of a scholarship expressly declared his wish that his benefaction should be accessible to persons who have no need of pecuniary aid in obtaining a liberal education—and no founder has ever done this—long-established usage would establish the strongest possible presumption that need was intended to be one of the grounds of selection. With regard to the terms on which the scholarships already founded were established, "T. W. H." has fallen into several errors, partly because he relied on the very brief statements of the annual Catalogue—statements which, though true as far as they go, are incomplete—and partly because on a few points he has not correctly apprehended the facts there stated.

2. The University would doubtless accept new endowments for money prizes to be awarded on competitions in scholarship, should such be offered them; but as it has needs which are much more urgent—such as funds for professors' salaries, for retiring pensions, and for the maintenance of collections and buildings—the government of the University, if consulted by proposing benefactors, would probably prefer to mention the more pressing wants.

3. In describing the working of the English "open" scholarship system "T. W. H." remarks: "As a matter of fact, all agree that nineteen-twentieths of these prizes naturally fall to those who are stimulated by necessity." My own observation and reading lead me to think that this very broad statement cannot be substantiated. Indeed, it is the common

opinion that the great majority of the holders of Oxford and Cambridge scholarships are persons who are in no need of aid in obtaining their education. I can call no better witness on this point than Dr. Mark Pattison, the Rector of Lincoln College. "In his 'Suggestions on Academical Organization' (pp. 58 and 59), he says, after mentioning the creation of a large number of open scholarships about twenty-five years ago:

"Open scholarships have been multiplied on all sides with eager rivalry. The market is glutted. . . . Yet university education is not cheapened. . . . Well-to-do parents continue to make their sons the usual allowance, and the scholar treats his £80 a year as so much pocket-money, to be spent in procuring himself extra luxuries. . . . The question is not, Has the multiplication of scholarships drawn more men to Oxford? but, Has it brought the university within the reach of a class socially below the class who frequented it before? I think the answer must be that it has *not*. The class which enjoys the scholarships and exhibitions now is the very same class which monopolized them under the old system of close foundations."

The "open" scholarship system, which made these valuable prizes the subjects of competition, was a great improvement on the former system, under which they were obtainable by interest or favor; but it has not made Oxford and Cambridge any less than before places of education for the rich and well-to-do alone. As Dr. Pattison puts it, "The open-scholarship fund, then, as now dispensed, does not act as an instrument of university extension. It acts as prize-money. Scholarships are educational prizes." Of course, this prize-money is won by the young men who have been trained at the best schools and have secured the best private tutors. These are privileges and helps which cannot be obtained by the poor.

4. My opinion is clear that no pity and no public money should be wasted on young men who feel it to be a humiliation to accept a scholarship at Harvard College. Such a feeling argues a deplorable lack of sense and manliness, and I believe it to be very rare among possible candidates for scholarships in this institution.

5. It should not be forgotten that it is a debatable question whether it be expedient to set money before young men as a suitable reward for scholarship. The Germans repudiate this idea with hearty aversion. The results of the scholarship and fellowship system in England itself are but doubtful.

6. The prize for which the candidates for the Harvard scholarships compete, under the existing system, is the chance of procuring a liberal education, or, at least, the chance of procuring that great advantage without incurring debt. The competition is keen, and success brings with it a great boon. The system is in the highest degree democratic; because it gives poor young men of capacity honorable means of obtaining a college education, and because it is a constant protest against the unworthy idea that poverty implies inferiority.

Your obedient servant, CHARLES W. ELIOT.

HARVARD UNIVERSITY.

TO THE EDITOR OF THE NATION:

SIR: Permit me to call the attention of "T. W. H." to the following from the *Athenæum* of December 28, 1878, as showing the present working of the English system of scholarships. It is taken from that paper's report of the conference of head-masters held the week before at Harrow:

"Dr. Jex-Blake's resolution regarding the value, length of tenure, and other details of open scholarships at the University next came on for discussion. The subject calls for no remark except so far as Mr. Percival's scheme appeared to meet most of the evils complained of. Experience has shown that, as a rule, the endowments originally left for the assistance of the needy who desire to obtain a university education are going more and more to those who are not needy and who are spending the sums, derived from such endowments in mere luxury and amusements; in fact, that the scholarship money is, in an increasing number of cases, doing more harm than good. Mr. Percival's scheme advocates a retrogade policy, viz., the fixing the maximum annual value of scholarships at £50, £40, or even £30, and leaving the colleges to deal with a large exhibition fund, which they shall dispense in the augmentation of scholarships where the winners of such scholarships are proved to require substantial assistance."

This is enough to disprove the fact in which "all agree, that nineteen-twentieths of these prizes naturally fall to those who are stimulated by necessity."

There is only one possible way to help needy students, and when the student is morbidly sensitive and jealous he must have his pride hurt. The English system of scholarships, according to those best acquainted with it, does not help the needy; our system does, but brings, in one case out of a hundred, "chagrin amounting to bitterness"; while Mr. Percival's scheme is tainted with all the evil of the American system, and the increased amount of scholarship called forth would be small.

There are other things in the letter of "T. W. H." to which I wish I might refer; but I have time only for what he writes in regard to the prizes of life being open to all, in opposition to scholarships which are open only to the poor. It may be true that the prizes of life are open to all, but no man can become a competitor with hope of success unless he possesses the necessary qualifications. Wealth, strength, learning, a powerful mind, are all forms of "caste distinctions"; and of these some particular one must belong to a man before he can even hope to obtain the prize he strives for. We have an illustration of this need of a definite qualification in the small number of men of ability and integrity who succeed in public life; such men cannot afford time to acquire what is now necessary; therefore, when they do try for some prize in politics they are beaten. Now, the college with its scholarships is the only place where these "caste distinctions," these accidents of birth, are reduced to the lowest amount. Only one thing is required of him who would gain the prize—that he be willing to work. And, therefore, the converting of these scholarships, which have been instruments in breaking down caste distinctions, into prizes for learning would be a great evil. There are enough incentives for men to rival each other; can we spare one which tends to make them equal? R.

GLOUCESTER, March, 1879.

TO THE EDITOR OF THE NATION:

SIR: I am one of those who, like "T. W. H.," were astonished that President Eliot did not deal with the only point in the scholarship question which has been much discussed—the comparative advantages of rank and need, or rank alone, as the criteria of assignment. "T. W. H." writes so strongly in favor of scholarships as prizes simply, and with so many plausible arguments, that it is worth while to ask whether they are all justified by the real circumstances of the case, and whether the moral considerations involved are of the consequence that appears to him. Being a graduate of a recent class at Harvard, I feel that I have seen from the inside the workings of a system of which your correspondent can only judge by hearsay. The objection made most prominent, in his letter, to the present system of administering scholarships at Harvard and other colleges is that the scholarship is a "visible badge of poverty," as much a dishonor as an honor, by reason of being sued for *in forma pauperis*, and that the receipt of one under these circumstances is to be concealed as a hindrance to social standing. Were it a fact that the system of scholarships in vogue at Harvard produced the pitiable results theoretically calculated to flow from it, there would be much more to be said for its abolition. But it must be said that the public degradation of receiving a scholarship—for such it appears to "T. W. H."—is scarcely to be considered when the assignment is a matter between the applicant and two or three professors. Outside of them, in general, nobody need know, and, in fact, nobody does know, who has a scholarship. Within my own class of about 175 there must have been from thirty to forty different members who in one year or another received a scholarship, and yet, on going over the list, I cannot put my hand on more than seven or eight whom I knew to have held one, although I had more and better opportunities for knowing than most. Of course there are a score of others of whom it would have been argued thus: A. B. is poor or of limited means; A. B. ran well; *ergo*, A. B. has a scholarship. But the fact that A. B. is poor is the only known fact which could possibly discredit him socially. The scholarship is a mere incident whose existence is only inferential; and that its existence, unknown, could degrade a man socially as "a visible badge of poverty," is a paradox needing no refutation. If it be said that the fact that the recipients of this sort of aid do not publish it to the world is proof that they are ashamed to have it known, it is answered that a scholarship is, to a certain extent, an honor that, like a creditable mark on an examination or a part at Commencement, they do not care to proclaim upon the housetop. It must be confessed, however, that while most men are not ashamed of their poverty, a good many do not care to have it publicly referred to, and for this reason the names of the holders of scholarships are not printed in the college papers. It follows, then, that the private assignment of scholarships hitherto in vogue at Harvard accomplishes the good designated, in most cases, by their founders—the aid of young men whose means are limited—and at the same time does not make them a visible badge of poverty.

The stumbling-block with those who urge a change in the present sys-

tem is the notion that the first and chief idea of a scholarship is an honor, whereas it is a regulated benefaction. If the benevolent individuals who have endowed scholarships in New England and elsewhere could be asked their purpose in so doing, the large majority would, no doubt, answer that they wished to help the coming generations of youth to a liberal education, and, in order that their money might not be misapplied, they expected it would be given only to those who are worth helping—*i.e.*, those whose intellectual promise is such as to make it worth while to ensure its results by a thorough and extended education. They would say that their idea—the American idea—of a scholarship, was not that of an honor to those who need assistance but an aid to those of honorable deserts. For colleges to act on any other theory than this is to cut off most of their hopes of further endowments of this character.

If a scholarship must be looked on as purely and simply an honor, to be sought by those who will value it as such, and have no especial interest in the form in which it comes—money—then it becomes an important question whether it is wise to hold out to the student with fair ability and plenty of means the inducement of from one to three hundred dollars to expend a year more than he needs. Would not some other form be preferable? And here we are answered by President Eliot, who shows that there are numerous ways in which honors can come to the well-to-do student who needs no pecuniary help. Those who will not work for honorable position on the rank-list, for a commencement part, for a Bowdoin prize dissertation, for a "detur," for "second year" and "final honors," so called, for admission into the Phi Beta Kappa, for a place in those college societies where ability has an equal chance with every other good quality, and lastly for the very love of learning itself, are scarcely worth tempting with golden bait. Scholarships are not to be judged on the same basis as the few money prizes offered at Amherst and other colleges for speaking and literary composition, and which come to but a few of the very best, and as a rule to those who need the money. When twenty-five or thirty scholarships are offered in one class, for the same thing, their value as prizes, *ipso facto*, seriously diminishes.

But the most regrettable circumstance about the communication of "T. W. H." is his sad illusion about "caste distinctions," the enhancement of which is his chief objection to the present system. Judging of American colleges from Harvard of recent years, I think I may say that they have not yet come to such a pass that the student of such limited means as to need a scholarship is thought less of or less honored with those outward distinctions that students show their fellows, because he is such. We are not yet so low that we need "the equalizing influence of the English method," for the simple reason that "the heir of an estate" is on no better footing in an American college than "the poor young man." Good manners, good fellowship, and a fair amount of brains are a sufficient passport into the most esteemed circles of college life. A student of small income is necessarily excluded from a few clubs where the expenditure of money is as much an object as a means, and from intimate relations with those who actually spend a great deal, for the reason that he cannot follow them in their recreations. But it is not from this phase of college life that we can judge of social standing, or rather public standing as a member of a class. With these things the system of dispensing scholarships has nothing to do, and can have no effect for good or ill. It might be urged with much greater force that the prices of rooms should all be equalized for democratic reasons, and that Harvard students should not be allowed to occupy the $500 rooms in the private dormitory known as Beck Hall. A cheap room is such an evident sign of small means as a scholarship is not, and the separation of students into occupants of cheap and of expensive dormitories has a much greater tendency to develop caste than any system of administering scholarships. The same line of argument would abolish the Harvard "loan fund" for the relief of poor students without regard to rank, or distribute it evenly over the poor and the rich, as undoubtedly the latter could find a use for it. Lastly, it must not be forgotten that colleges in England and America are essentially eleemosynary institutions. It is only a matter of degree, to which the recipients of the highest scholarships, the cheaper ones, and of none at all are indebted to the founders and benefactors of their Alma Mater; and it is a wonder that the abnormally delicate natures who told "T. W. H." "with a chagrin amounting to bitterness and with tears in their eyes of the struggle it cost them to accept that visible badge of poverty" called a scholarship, could ever have condescended to come to Cambridge at all, when, according to President Eliot's calculation, they must have cost the college $100 more than they paid in tuition fees, and to that extent have been pensioners on the charity of the past.

B.

To the Editor of The Nation:

Sir: In reading the letter on "Open Scholarships in American Colleges," from your correspondent "T. W. H.," the impression was conveyed to me that the writer associated with the collegiate distinction of sizarship the invariable and general condition of poverty. If such be the case he is certainly mistaken, as in the Dublin University the sizarship examination, whether classical or mathematical, is purely competitive and unrestricted by any other conditions than those of previous failure. Neither poverty nor wealth is a recommendation or hindrance.

A Dublin University Ex-Sizar.

Reading, Pa., March 1, 1879.

Notes.

Houghton, Osgood & Co. will publish 'Locusts and Wild Honey,' by John Burroughs, in a uniform edition with his 'Wake Robin' and 'Winter Sunshine.'——We have received from John Murphy & Co., Baltimore, 'Studies from the Biological Laboratory of Johns Hopkins University, No. I.,' a collection of five papers, all of which save one have already appeared in medical periodicals. The principal one, by the editor, Prof. H. Newell Martin, is on respiration in the frog. Several plates accompany this number.——The Third Annual Report of the Trustees of the Boston Museum of Fine Arts gives a very impressive idea of the prosperity of that institution, and of its usefulness, now that it has been enlarged. "With the pupils of the Drawing School and those of the Embroidery, the Wood-Carving and Modelling, and the China-Painting Schools, the Museum presents an appearance of activity and life most pleasant to behold."——"Hydrographic Notice No. 6," just issued by the Bureau of Navigation at Washington, though intended primarily for the enlightenment of mariners, has an interest for all who are fond of geographical study, and especially of Arctic research. It gives a succinct account of the present expedition of Prof. Nordenskjöld, which is attempting the northeastern circumnavigation of the Siberian coast, and which, after successfully rounding Cape Tchelyuskin, and passing the mouth of the Lena River at the end of August last, has been reported icebound not very far west from Behring Strait. The last letters from the Swedish professor describing his voyage are given in full, with extracts from those of the *Vega's* officers; and a copy of Lieut. Palander's chart from the Yenisei to the Lena Delta is appended. This "Notice" so much resembles a fragment of a Geographical Magazine as to suggest the possibility of the Hydrographic Office in some measure supplying a serious want in our scientific literature.——An ardent genealogist proposes in the *Evening Post* that the youth of New York celebrate the 21st of February, 1880, by "the reading or speaking of their several essays on the characteristics of Washington"; and offers the rooms of the "Pilgrim Record Society" for that purpose, at No. 20 Sutton Place.——From *Nature* (January 30) we learn of a Postal Microscopical Society, now five years old, which distributes by post microscopical slides among its members, "with facilities for these members making remarks on the slides they receive." Special slides for the medical members and for those botanically inclined are in preparation.——We lately called attention to the Boston Society of Natural History's "Guides for Science-Teaching." Three numbers (four parts) have now been issued, viz.: "About Pebbles," and "Commercial and Other Sponges," by Alpheus Hyatt; and "Concerning a Few Common Plants," by Prof. Geo. L. Goodale. Mr. Hyatt's lessons are illustrated.——The Annual Report of the State Geologist of New Jersey for 1878 traces with particularity the southern limit of the glacial drift in that State, and promises much greater detail hereafter; describes and classifies the soils, and defines the pine and oak areas of the southeastern portion of the State; indicates the newer clay and glass-sand developments; discusses the important question of water supply for the most thickly settled section—the suburbs of New York; and generally illustrates the material resources of New Jersey and the practical value of the Survey, furnishing a guide to capitalists and investors in land, and pointing the way to needed public improvements. It is accompanied by a beautiful map, showing the drift, the oak, and the pine districts——Mr. Seymour Haden has issued a syllabus of a course of three lectures on "Etching," to be delivered on March 22, March 29, and April 5, at the Royal Institution, Albemarle Street, the Alma Mater of the London lecture halls. To have lectured there is almost as great a distinction as a university degree. The first lecture treats of the History of Etching: the origin and *raison d'être* of etching and painter-engraving; in what they differ from ordinary engraving; why the Old Masters etched, and

why the art should not be lost; the masters of etching (illustrated). The second lecture explains the Preparation of the Plate: metals and their mordants, and the modus operandi (demonstrated). The third lecture will review the paper, the ink, the press, the printing (demonstrated), and the proof. Touching these lectures Mr. Haden himself writes to a correspondent: "If my art opinions have any recommendation, it is that they are certainly not the opinions of anybody else." It will be interesting to read these opinions when uttered at full length.

—We sincerely regret that our faulty memory of the circumstances attending the publication of a recent paper on "The Amendment of the Patent Law" in *Scribner's Magazine* led us last week to speak of it as having "escaped the editorial vigilance." It was, in fact, avowedly inserted as an answer to a previous article on "Our Patent System" in the November number, and neither its origin nor its partisan character was concealed. Our imputation was, therefore, unjust in this particular. Still, we suppose it is reasonable (and this was the spirit of our criticism on *Scribner's*) to hold magazine editors to some accountability for the good faith of their contributors, even when a "symposium" is in question, or letting both sides be heard. That this precaution would have been wise in the case of Mr. Raymond, in spite of his legal relations to the Western Railroad Association, clearly appears from a communication headed "Conscience and the Patent Laws," on p. 762 of the March number of *Scribner's*—a communication which we did not happen to read till after our last issue.

—Mr. William Winter is one of the few writers on current theatrical topics who has knowledge both of the stage and of the drama, as well as some share of the critical faculty, and who has distinct ideas on the art of acting, and shows, therefore, some sense of proportion in his remarks on the plays and players of the day. It was he who prepared the letter-press for the twelve striking drawings of Mr. W. J. Hennessy, representing Mr. Edwin Booth's 'Dramatic Characters,' and he is now engaged in editing a series of this actor's prompt-books, or editions of the plays in which Mr. Booth appears, printed as they are acted—that is, with many omissions and transpositions, and a few interpolations made necessary by the great changes in the physical conditions of the theatre—changes which have been especially important within the past half century. We have, for one thing, adopted the fashion of using, when possible, only one set scene to an act. To this fashion both Shakspere and Sheridan must conform. Most, if not all, of our acting editions of old plays were made before this fashion obtained, and they are, therefore, now behind the age. More than this, the accumulated traditions of the stage provide a fund of "business," or by-play, which adds greatly to the effect of the play when acted. Mr. Booth's experience, personal and inherited, has shown him what to select and what to reject. The version of the play prepared by him is here printed on one side of the page only, the other being left blank for any remarks the student may have to make. An introduction to each piece, notes on the costume and scenery, selections from the leading criticisms of the work, and extracts from other authors, shedding light on the motive of the play, have been contributed by Mr. Winter with taste and skill. No more instructive lesson in the requirements of the theatre can easily be had than a careful comparison between "Hamlet" as it reads in a good edition of Shakspere and in these beautifully-printed prompt-books.

—The English Dialect Society have published, through Trübner & Co., Part I. (A–F) of a 'Dictionary of English Plant Names,' compiled by James Britten and Robert Holland; an octavo volume of more than two hundred pages. It is the result of ten years' labor, and in part embraces vernacular names hitherto unpublished, in part those which have been printed in dictionaries like Halliwell's and Wright's, and in county glossaries and vocabularies, and also the names (whether now obsolete or not) "by which British plants are mentioned in the works of the older botanists." An effort has been made in every case to identify the plant by its scientific name, and to give a reference to the earliest occurrence of the popular name in print. There are frequent quotations from the poets, both early and late; thus, we get some idea of Shakspere's "*canker* in the hedge," and "*dead men's fingers* call them," and learn what may be known about Milton's "twisted *eglantine*," and this about Wordsworth's "little *celandine*": "So called bycause that it beginneth to spring and to floure at the comming of the swallowes [*chelidonium*], and withereth at their return." Apropos of *Canterbury bells*, we are told what sort of bells the pilgrims hung to their horses, and why; with *Danes' Blood* there would appear to be a genuine local historical association; *dogwood* takes its name not from the animal but from the skewers made from it; *horse-chestnut*, generally thought equivalent to "coarse chestnut," is perhaps traceable to the custom prevalent "in the East Country, and so through all Turkie," of giving the fruit "unto horses, to cure them of the cough, shortnesse of winde, and such other diseases"; *bay-berries* is pleonastic, as "in old works *bay* means a berry generally"; *brunel* (*Brunella vulgaris*) "took its rise from the German *die Braune*, an 'infirmitie among soldiers that lie in a campe,'" and for which the plant served as a specific. There is a multitude of names of the following class: *Adam-and-Eve*, *Boots-and-Shoes*, *Butter-and-Bread*, *Cats-and-Dogs*, *Cocks-and-Hens*, *Eggs-and-Bacon*, *Face-and-Hood*, *Fingers-and-Toes*, etc. Among corrupted names, none is more curious than *Cast-me-down=Cassidonie=Stœchas sidonia*. The different ways of spelling the same name are best exemplified in *acharne* ('acorn'), etc., to *atchorn*, fourteen in all, not counting "The pigs are gone o' *aitchorning*." An index of scientific names groups the vernacular synonyms very strikingly; a single plant has in some cases as many as twenty or thirty different appellations.

—The historical literature of the year 1878 was very meagre; and although it includes many works of solid merit, very few of these will be found to stand unequivocally in the first rank as works of literature. The field of ancient history has been distinguished by publications upon antiquities rather than history proper. Undoubtedly the most important accomplishments in this field have been the excavations at Olympia and elsewhere, and the accounts (as Schliemann's 'Mycenæ') of excavations made in previous years. The translation of Max Duncker's 'History of Antiquity,' of which the first volume has appeared, is important for the English public. Of original works there have been some valuable ones, in both modern and ancient history, in the "Epoch Series": besides this, there is Bosworth Smith's 'Carthage and the Carthaginians.' We will also mention the republication of Sir Gardner Wilkinson's 'Ancient Egyptians,' and the new and sumptuous edition of Duruy's 'Histoire des Romains.'

—In mediæval history there has been rather more. The second and third volumes of Gfrörer's 'Byzantinische Geschichten,' edited since the author's death by Dr. Weiss, reach the year 1071; this is a work of high value, although it is one-sided, representing the author's ultramontane position. Covering partly the same period is Osborn's 'Islam under the Khalifs of Bagdad,' continuing the author's 'Islam under the Arabs.' A German work in the same field is Lüttke's 'Der Islam und seine Völker.' A new volume in the Heeren and Ukert (and Giesebrecht) series is the 'History of Bavaria,' by Sigmund Riezler, author of 'Die literarischen Widersacher der Päpste.' The first volume reaches the year 1180. To judge from the author's previous works, it must be especially valuable in the history of civilization. Denis's 'Huss et la Guerre des Hussites' is pronounced a work of high merit, based upon original research. The translation of Burckhardt's 'Civilization of the Renaissance in Italy' belongs also here. For Church history we would notice Böhringer's 'Kirche Christi,' a biographical history of the church before the Reformation; ten volumes have appeared of a second edition, and three more are yet to appear (devoted to Augustine, Leo I., and Gregory I.), the whole covering the ground of the first volume of the original edition. It is pronounced to have almost the value of a patristic library. Trench's 'Mediæval Church History' we lately noticed. Gairdner's 'Richard III.' belongs to the close of the Middle Ages. This monarch, we are happy to say, is not "rehabilitated." Rambaud's 'Histoire de la Russie' (of which a translation has been announced) is a book which has received the highest praise. Reuter's 'Geschichte der religiösen Aufklärung' has been brought, in the second volume, down to the year 1300. The third volume of Stubbs's 'Constitutional History of England' completes the work.

—In modern history there is comparatively little. The second volume of Reumont's 'Toscana' comes down to 1859. Moritz Ritter, too, has a volume on the Cleves and Juliers war of succession (1610–11). For the eighteenth century Arneth's 'Geschichte Maria Theresias,' vol. 8, reaches the year 1776. For the same period De Broglie's 'Secret du Roi' has done a little, but perhaps not much, to rescue Louis XV. from the contempt in which he is held. The new volume of Taine's 'Origines' is important. Dixon's 'History of the Church of England,' vol. i., covers the important period 1529–37. The new volumes (fourth and fifth) of Masson's 'Milton' belong rather to history than biography. The most important work in the modern history of England is probably Lecky's 'England in the Eighteenth Century,' although Walpole's 'History of England in the Nineteenth Century' has also great merit. For American history we have the second volume of Bryant, and the second volume of Von Holst's great work.

—A fresh interest in the Mendelssohn family has been awakened in Germany by the publication of Hensel's 'Die Familie Mendelssohn' (Berlin : Behr). The author, a nephew of Felix Mendelssohn-Bartholdy, has made a most judicious use of the materials at his disposal, and by numerous letters and extracts from diaries, added to his own personal reminiscences, enables one to form a most charming picture of this extraordinarily-gifted family. The first volume opens with a short biography of Moses Mendelssohn, whose petition to the king, Frederic the Great, for permission to live permanently in Berlin, his friend D'Argens endorsed with the words : "Un philosophe mauvais catholique supplie un philosophe mauvais protestant de donner le privilège à un philosophe mauvais juif. Il y a trop de philosophie dans tout ceci, pour que la raison ne soit pas du côté de la demande." His two oldest sons, Joseph and Abraham, the founders of the great Berlin banking-house, were both remarkable men. The former devoted himself in his leisure hours to scientific studies, and was a friend of Humboldt. Hensel relates that Humboldt came to him one day in great distress. He had just received notice to quit his house, in which were stored his vast collections. That afternoon Joseph wrote to him as follows : "The house in which you live is now mine. Arrange it to suit yourself." Abraham, the father of Felix, was in many respects like his father, and the picture of his family life is almost ideal in its beauty. There are many of his letters, together with those of his daughters, Fanny and Rebecca, full of vivacious descriptions of the persons they meet and the things they see. There are also some, very remarkable for the nobility of their sentiment and the purity of their diction, written by his wife Leah. Hensel closes his work, which has been for some time privately circulated, with the death of Felix in 1847.

—An interesting pamphlet, professedly written by a Russian, who conceals his name, appeared last year, bearing the title 'Études sur le développement politique, social et intellectuel de la Russie depuis la guerre de Crimée,' and dated St. Petersburg, May, 1878 (Neufchâtel: J. Sandoz). It deals with the progress in public instruction in the writer's native country. In the first fifteen years of the reign of the present Emperor the higher public instruction made rapid progress ; after that date a retrograde movement showed itself, but this was counterbalanced by progress in another direction. Between 1868 and 1872 the students of the universities had diminished twenty per cent., but those of other superior schools had increased in fully the same proportion. The Technological Institute, which had only 480 pupils in 1868, had more than 1,000 in 1875 ; the Academy of Medicine had at the same time 1,400. There were 350 in the four military and one nautical academies, and about 4,000 in those of the mining engineers, roads and bridges, forests, architecture, philology, and agriculture, and other kindred institutions ; and as most of the special schools have a course of four years, it may be estimated that about 2,400 youths per year enjoy the benefits of the higher instruction, which, estimating the population at 80,000,000, would only give an average of one educated person in 33,000 souls. In 1855 Russia had only 77 gymnasia with 17,817 pupils ; in 1875, 184, and 47,639 pupils. Adding the *real*-schools, those of the Ministry of War, and the normal, agricultural, commercial, and technical, there are in Russia more than 70,000 collegians, or one to 1,145 of the population; while in France there is one to 250, and in Germany one to 228. With regard to the means of education for girls the situation is much better. The pupils of the Russian female gymnasia have been found by the professors of the University of Zürich better prepared than any of the other female students, and this has also been noticed at the St. Petersburg Academy of Medicine and the universities of Moscow and Kiev. The creation of gymnasia for girls is the work of our day, as they did not exist under Nicholas. In 1875 there were 62, and 136 pro-gymnasia, with 30,147 pupils, which must be augmented by 6,000 girls receiving secondary instruction in several of the large towns ; many of these are devoting themselves in their turn to instruction, and doing valuable work in the primary schools. The army schools have likewise powerfully contributed to the spread of education. Among the recruits 87 per cent. are totally ignorant, whilst at least 50 per cent. of the soldiers can now read and write—thus, 37 per cent. owe their primary instruction to their service in the army. The ecclesiastical schools are losing ground; in 1865 there were 230 schools and 52,083 pupils; in 1875 there were 243 schools and 40,596 pupils, a diminution of more than 11,000 pupils in ten years ; this diminution is, however, the less to be regretted, as the principal object of these schools seems to be to retain their pupils in the routine and superstition which are repugnant to modern ideas of progress and enlightenment. The announcement has recently been made that a university would immediately be established at Tomsk, in Siberia. This was strongly recommended in 1875 by Kaznakoff, the Governor-General; and as the benefits of the higher instruction have heretofore been denied the inhabitants of Siberia, Turkestan, and the Caucasus, they will doubtless joyfully welcome this addition to their means of superior instruction.

LINGUISTIC PALÆONTOLOGY.*

THIS exhaustive work, the revision of which was the latest labor of its lamented author, is a notable example of the manner in which, by modern methods, philology is brought to elucidate the history of the human race. No sooner was the relationship established between the group of languages known as Indo-European, or Aryan, than scholars perceived that by tracing individual words through the several tongues in which they occur, light would be thrown upon the origin and history of the ideas or things represented by those words, and conclusions could, with considerable certainty, be drawn as to the connection between different nationalities and also as to their progress in culture prior to the successive divisions of the race. Thus, to take a familiar example, the marked identity in the names of the primary numbers throughout the Aryan dialects shows that the decimal numeration was familiar to the prehistoric ancestors of the race while yet united in Central Asia. This interesting line of thought has been industriously worked out by successive generations of philologists ; and, in the book before us, the results of the labors of Bopp, Grimm, Benfey, Pott, Weber, Lassen, Müller, Kuhn, Fick, Burnouf, Rosen, Wilson, Muir, Roth, Whitney, Aufrecht, Böhtlinck, Grassmann, Justi, and many others, are brought together by the learned author, are acutely analyzed and classified in order.

In the history of mankind there is no grander subject of investigation than the career of the great Aryan family which, starting from its rugged Asian home, has encircled the world, founding successive empires, ever foremost in the arts of peace and war and in the race of civilization, and evidently destined in the future to dominate the earth. The events now taking place in the East wear a new and picturesque significance when viewed in connection with the past. It is probably at least five thousand years since the European Aryans left their brethren to the east of the Caspian ; and now we see a fragment of the Teutonic branch returning by new and circuitous paths and overthrowing a realm of their Hindu kindred four thousand years old ; while the Slavic branch has gone back by nearly the original route to reoccupy its ancestral seat, and Saxon and Slav are preparing for a death-struggle, the prize of the victor being the original home of the common stock.

To reconstruct, from the depths of forgotten Time, the vanished civilization of the rude fathers of these energetic nations is surely an interesting task, and the manner in which it has been so far accomplished shows how much can be done from unpromising materials by a careful combination of analysis and synthesis. M. Pictet commences by investigating the ethnographic questions involved in the names of the various peoples sprung from the Aryan stock. To determine their original habitat he then considers the terms relating to weather and climate. Thus, he shows that the names of winter and spring can be traced throughout all Aryan tongues, proving that these words and the ideas which they represent were formulated before the earliest separation of the tribes ; that summer is indicated by a word common to the Zend, the Celtic, and the Germanic dialects, while it differs in Sanskrit and the classical languages, thus showing that different estimates were placed on the hot season by those whose migrations led them into different climates ; and that the terms designating autumn are as divergent as possible in the various tongues, showing that the season was not recognized as distinct until after the complete dispersion of the race. In this mode he proceeds with geographical and topographical terms—mountain and valley, sea and river, rocks and stones, etc. Then taking up the names of metals, he gives us much curious insight into the comparative degrees of civilization indicated by familiarity with these indispensable instruments of progress. Turning to the vegetable world, he first considers general terms, such as tree, trunk, branch, root, wood, bark, leaf, flower, forest, etc.; then the wild species, as oak, pine, elm, beech ; the cultivated ones, as the apple, pear, plum, cherry, almond, chestnut, walnut ; then grains and vegetables in detail, and finally wild flowers. Passing to animals, he first investigates the names of domestic beasts ; and here we may instance, as an example of his method, the interesting research into the appellations of the cow and bull. Thus, for bull and cow we have in Sanskrit *gaus*

* 'Les Origines Indo-Européennes, ou les Aryas Primitifs. Essai de Paléontologie Linguistique. Par Adolphe Pictet.' Deuxième édition, revue et augmentée. 3 vols. 8vo. Paris. 1878. New York : F. W. Christern.

or *go*, Zend *gao*, Persian *go* or *gaw*, Bucharian *gao*, Kurdish *gha*, Afghan *guai*, Armenian *gov* or *kov*, Old-German *chuo*, Anglo-Saxon *cu*, English *cow*, Lettish *gows*. The Slav dialects only retain it in some derivatives. In the classical and Celtic tongues the frequent substitution of *b* for *g* gives us for the masculine *βοῦς* and *bos;* while for the feminine we have the Irish *bo*, Cymric *bu*, Armoric *bu*, and Cornish *buch*. Another Sanskrit term *vaçra*, and *vaça*, shows the origin of the Latin *vacca*, with its numerous Neo-Latin derivatives. For bull or ox there are various Sanskrit words—*ukshan*, *sthira*, *balin*, *usra*, *mahisha*, and *damya*, which can all be traced in other languages. To *ukshan* can be assigned the Zend *ukhshan*, Gothic *auhsa*, Anglo-Saxon *oxa*, English *ox*, Scandinavian *oxe*, Old-German *ohso*, Cymric *ych*, Armoric *ochen*, Irish *ess*. To *sthira*, the Gothic *stiur*, Anglo-Saxon *steor* or *styre*, English *steer*, Old-German *stior*, Scandinavian *thior*, Swedish *tjur*, Danish *tyr*, Greek *ταῦρος*, Latin *taurus*, Russian, Polish, and Bohemian *tur*, Irish *tor*, Lithuanian *tauras*. To *balin*, the Persian *bala*, Russian *vol*, Polish *wól*, Bohemian *wul*, Lithuanian *builis* and *bullus*, Scandinavian *bauli*, Anglo-Saxon *bulluca*, English *bull* and *bullock*, Irish *bulan* and *bulog*, Welsh *bwla*. To *usra*, the Old-German *ur* and *uro*, Anglo-Saxon *ur*, Scandinavian *ur* and *uri*, Celtic *urus*, and German *auer-ochs*. To *damya*, the Old-Irish *dam* and Albanian *dhema*. That the domestication of the bull was originally due to the Ayrans would seem to be shown by the extension of various Sanskrit synonymes among the other great families of mankind. Thus, *gu* has penetrated to China, where it is found in the form *go*. *Ukshan* and *mahisha* are the sources of various Tartar designations. *Sthira* or *sthura* is the source of the Semitic appellatives, as Chaldee *tora*, Syriac *tauro*, Arabic *thawr*, Hebrew *shor*, Ethiopian *tore*. And it is noteworthy that the three Coptic words, *mase*, bull, *vashi*, cow, and *ehe*, ox, correspond with the three Sanskrit names, *mahisha*, *vaça*, and *ahi*. The same process applied to the words employed to designate the horse shows the origin of all, or nearly all, the European names for that animal in the rich synonymy of the Sanskrit, which has nearly a hundred and fifty words signifying horse, mare, colt, etc., and in a subsequent chapter there is a very interesting investigation into the relation between the terms used for cattle and those denoting fortune, wealth, property, etc., into the details of which space will not permit us to enter. Attention is likewise paid to the myths connected with the cow, which show the supreme importance attached to that animal in the pastoral life of the primitive Aryans; singularly enough, however, no allusion is made to the remarkable coincidence of the cosmogonic cows, Abudad and Audhumbla, in the Zend and Norse mythologies, though the latter is mentioned, as well as the cow Surabhi, produced by the Hindu Devas, when they churned the ocean with the mountain Mandara.

Closely connected with this are the terms relating to milk, which afford an interesting example of the deviation of words from their original significance. Thus, the Sanskrit *duh*, to milk, gives *duhitar*, she who milks, whence are derived the various appellatives of daughter, in the Iranian, Hellenic, Celtic, Germanic, and Slavic dialects. But the Vedic poets regarded rain as the milk (*doha* or *dugdha*) of the clouds or heavenly cows, whence are derived the Scandinavian *dögg*, rain, the Old-German *tau* or *tou*, Anglo-Saxon *deaw*, English *dew*, Pomeranian *dauk*, Old-Slav *duzhdy*, Russian *dozhdy*, etc., while the English *dug*, a teat, is evidently a reminiscence of the original sense. On the other hand, our word "to milk" is traceable to the Sanskrit *marg*, signifying to stroke or rub, whence come the Greek *ἀμέλγω*, Latin *mulgeo*, Old-Irish *malg*, Anglo-Saxon *meolcan*, Scandinavian *miolka*, Old-German *melchan*, Lithuanian *milszti*, etc., leading to the inference that the Oriental Aryans adhered to the primitive significance of *duh*, while the Western branches, in attaching to it the derivative meaning of rain, sought a different root for the idea of milk and milking, and this before they split into the divisions which formed the Hellenic, Italiote, Celtic, Teutonic, and Slavic races. Thus we are led to the conjecture that a separation took place in the East prior to the time when the first of the successive Aryan bands sought new homes towards the setting sun.

It would be interesting to follow M. Pictet as he thus proceeds to discuss in due order the Aryan philology of all the other varieties of natural objects, poultry, vermin, and parasites, wild beasts, birds, fish, reptiles, shells, and insects, for curious questions present themselves on every hand from materials apparently the most insignificant. This, however, is impossible here, and we can only indicate briefly the remainder of his plan, which leads him to consider next the terms connected with material civilization, examining successively the pursuits of man, hunting and fishing, pastoral life and its products, agriculture, with its processes and implements, arts and trades, including war and weapons; products of industry, houses, utensils, clothing and ornaments, food and drink. Thus two volumes are filled, and the third commences with social relations, starting with the family and taking up successively property, law, manners, and customs. Finally, consideration is given to intellectual, moral, and religious conceptions, embracing psychology, numeration, astronomy, traditions, superstitions, and religion, which are all treated with the same overflowing abundance of detail; and the work ends with some chronological speculations of little moment, and an exceedingly interesting résumé, in which the results of the preceding laborious investigation are condensed into a sketch of what may with reasonable certainty be affirmed of the condition of civilization and thought among our prehistoric ancestors. To all this there is lacking the indispensable index—that aid to reference of which the Frenchman (or Swiss) seems to be congenitally ignorant, and the absence of which deprives a book like the present of fully one-half of its permanent working value.

In a work of so large a scope as this, built up of infinite minute and scattered fragments, and treating of many points which have been and yet are the objects of warm discussion among the most competent scholars, it would be idle to expect absolute completeness or positive certainty on all points. Yet no one can peruse it without feeling confidence in the laborious industry, the fairness, and the modesty of the author, who is content to state his doubts, where doubt exists, to give the opinions of those who differ from him, and to put forward his own on controverted questions without presuming to assert that he has found the correct solutions where others have failed.

Some few omissions and deficiencies we have observed. Thus, in considering the Sanskrit root *labh*, to take, reference might properly have been made to the derivative Laverna, the Latin goddess of acquisition, who became the patroness of thieves and swindlers. Anglo-Saxon words, moreover, are not as frequently cited as might have been desirable. *Ban* and *bana* might have been quoted among the derivatives of the Sanskrit *bandh*, to punish or put to death; under *magha*, power, in addition to the Anglo-Saxon *magan*, it would have been desirable to cite *mæg*, whence comes the English *may;* and when collecting the terms which show the custom of using the hand to confirm contracts, *handfæstnung* and *handfæstung* might appropriately have been introduced. Still more remarkable is the omission of the Anglo-Saxon *waelig*, wealthy, alongside of *wealdan*, to rule, in considering the derivatives of *vriddhi* in their curious divarication into terms signifying respectively riches and power. The fragments also of ancient German speech, preserved in the Malbergian glosses of the Salic Law, corrupt as they are, might occasionally have afforded an illustration which has been overlooked. Thus, a word which is variously written *anthedi*, *anthedio*, *antidio* and *authedio*, with the evident meaning of theft, might properly have been alluded to, along with the Gothic *thiubs*, the Irish *taid*, and the Anglo-Saxon *theof*, among the derivatives of the Sanskrit root *ta;* and the Malbergian form *chana*, for cock, would have served as a link in the chain between the Sanskrit *kanuka*, Old-German *hano*, and Anglo-Saxon *hona*, whence comes our modern *hen*.

More serious is M. Pictet's error when, in examining the Aryan traditions of the Deluge as they have existed among the Hindus, Greeks, Celts, Teutons, and Lithuanians, he states that no trace of it is to be found in the ancient Iranian branch, omitting the fact that it is described in detail in the Bundehesh. This oversight is the more notable since he compares the moral and religious lesson taught concerning it in Genesis with the assumed absence of such a lesson in the Aryan traditions, for the Bundehesh specially tells us that the flood was sent by the Creator to destroy the *kharvastars*, or noxious beings formed by Ahriman, and that the rain fell until all the earth was covered to the height of a man, and all the *kharvastars* were drowned. In fact, the author is not always to be followed implicitly in his observations upon religious faiths and customs. Thus, he is evidently mistaken in assuming that the slaughter of wives and followers at the pyre or grave, by Celts and Teutons, shows a return to barbarism by those tribes after enjoying a higher civilization among the prehistoric Aryans. It is true that the Suttee was not enjoined in Vedic times; but there is nothing to show that such sacrifices were not practised, at least occasionally; and we have evidence that they were in vogue among the Turanians at a very early period—possibly coeval with that of the Aryans prior to their dispersion—affording grounds for the belief that the origin of the custom of giving companions to the dead in the future world is attributable to a period earlier than the primal separation of man on the eastern continent into the families at present recognized. M. Pictet's argument, moreover, to show that the polytheism of

historic times arose out of a presumed original monotheism, is inconclusive and illogical; and the limitations of the philological process in his hands are shown in the fact that he omits to make any reference to ancestor-worship as part of the early Aryan faith, although its existence in all the branches of the race indicates that it was a leading feature, if not the original source, of the primitive religion.

All these, however, are trivial defects which can be readily overlooked in a work which brings to the reader in orderly sequence so vast a mass of recondite learning. It has been the labor of a life-time, and our thanks are due, in no stinted measure, to the patient and laborious scholar who has rendered accessible to us that which throws so much light on many debatable questions in the history of material, mental, and religious development.

MOZLEY'S ESSAYS.*

THESE two handsome volumes represent only in part the results of a laborious literary career of thirty years. They are taken from contributions made at various times to the *British Critic*, the *Christian Remembrancer*, and the *Quarterly Review*, and recall the elaborate treatment which seems fast becoming a tradition in our periodical literature. Several of them, indeed, in point of bulk are more like a volume than a magazine article; yet they are nowhere open to the charge of being diffuse. It is not often that a collection of miscellaneous writings bears throughout so genuine and strong an impress of the writer's personality. Dr. Mozley led a retired life, and only in the latter portion of it came to be widely known; but he seems to have made a deep impression upon those who were brought into personal contact with him, and this impression will be shared by all who become acquainted with him through these pages. Even without the help of the affectionate and appreciative sketch which opens the volumes it would be impossible not to arrive at the conclusion that the author was a very able, a very sincere, and a very honest man; a man equally strong in his convictions, tenacious in his grasp, and independent in arriving at his conclusions. While according for the most part a hearty support to a particular party, and with an inclination to controversy which showed itself in his earliest years, when as a child he was forced to listen to religious teachings from which his intelligence revolted, he was yet never held within the strict lines of party discipline, and never failed to couple a certain largeness and generosity of view with an uncommon capacity of disapprobation. His strongest intellectual bent was in the line of metaphysical enquiry; when dealing with philosophical principles his grasp was always vigorous. Combined with his marked analytic faculty was a cognate disposition to study the workings of human character, a disposition in his case so strong that the habit of searching beneath the external act for the hidden motive amounted almost to an instinct. We are told that he habitually speculated on the character of all with whom he came in contact, a fact which accounts for the distinctive merits and distinctive defects of the volumes before us.

The first is filled with four elaborate essays upon Strafford, Laud, Cromwell, and Luther. Respecting the first two Dr. Mozley writes with the enthusiasm of an ardent admirer; respecting the last two with naturally a good deal of qualification. Yet the four essays have many points of resemblance. They abound in acute discrimination, they are vigorous in treatment, they evince a familiar acquaintance with the subjects discussed. With the exception of an infrequent phrase, which at times unpleasantly recalls the method of dealing with the opposite side of which the now forgotten novel of 'Ten Thousand a Year' was an illustration, they are courteous in tone, and to a young student, whose knowledge of the Civil Wars was derived mainly from Macaulay, they might serve as a wholesome corrective. Yet we cannot rank either one of these essays as a very important contribution to history. Not only do they all have the stamp of a controversial motive, but they are all alike defective in their mode of treatment. They are not historical, but analytical; and as a result we have not so much well-rounded conclusions from a wide survey of ascertained fact, as acute and ingenious speculation respecting probable motives. In his persistent impulse to search into the secret springs of action, Dr. Mozley falls into the very natural but very dangerous error of interpreting the facts of history in the light of some preconceived hypothesis.

It is easy to see how for a mind so peculiarly constituted as his the unique and dramatic character of Strafford must possess a strong attraction. He instinctively looks at the great earl not as a public man, related to a particular period, and charged with certain definite responsibilities both to his king and country, but as an ideal hero to be judged by a purely ideal standard. He is described as a genuine Shaksperian character; his unmeasured violence is gently designated "poetical excess in the article of proper pride and independence"; he was "full of his own majestic, illimitable idea of monarchy"; "a magnificent Norman viceroy, swiftly confronting and beating a nation." His statesmanship is praised for "its restless saliency, elasticity, fecundity." Could Charles only have trusted this guide, "his high-mettled charger would have carried him over all the Pyms and Hampdens right speedily." We need hardly say that this is not judging the career of Strafford by any of the tests which a sound historical criticism would recognize. An actor who played a conspicuous part in a great political crisis, whose acts were factors of momentous import for the welfare or misery of a nation, must be measured by more practical tests than those we should apply to one of the heroes of the Round Table.

Archbishop Laud is viewed by Dr. Mozley in much the same light. He is a prelate who had "caught the mediæval idea of the Church as a political estate, with pomp, wealth, and honors"; the feeling which he cherished towards it "amounted to a species of poetry." Here we see the same disposition to judge a career, not in its actual relations and from its actual results, but from a standard supplied by an analysis of the character and aims of the individual. "A great career founded on a dream" is Dr. Mozley's verdict on the man whose mistaken policy brought both church and state to ruin; but in this very statement is there not involved a contradiction? Too fair and intelligent to urge against Cromwell the vulgar charges of his enemies, Dr. Mozley characteristically falls back upon an acute distinction of Bishop Butler to prove that the Protector was essentially a hypocrite. The essay upon Luther contains a genial estimate of the reformer, but no more than the others deserves to be called an historical study.

It is in the second of these volumes that the distinctive qualities of Dr. Mozley as a writer appear to best advantage. The article on Dr. Arnold is a masterly estimate of a man richly deserving praise and admiration, but who, owing to various circumstances, has been admired and praised quite as much as he deserved. The remark that Arnold's character was too joyous, too brimful to possess the finest element of interest, shows the penetration of the writer's view. The estimate of Blanco White is also marked throughout by just discrimination. The essay upon the Book of Job is an admirable illustration of the writer's analytic power. But on the whole the paper reprinted from the *Quarterly Review* upon "The Argument of Design" presents the most striking evidences of Dr. Mozley's uncommon aptitude for philosophical discussion. The passage in which he explodes the common error respecting Lord Bacon's estimate of final causes is an instance of his studied accuracy of statement. We find, indeed, on every page evidences of a mental discipline of the highest order.

Turner's Liber Studiorum; a Description and a Catalogue. By W. G. Rawlinson. (London and New York: Macmillan & Co. 1878. 8vo, pp. xlvii. 207.)—This handsome volume addresses a comparatively small number of readers, but it will be welcome to all collectors of the plates of the 'Liber Studiorum,' and to all students of Turner's work who have opportunity to examine these plates with the degree of attention which they deserve. In the execution of his task Mr. Rawlinson displays ample knowledge and good judgment and good taste. His technical descriptions are minutely exact, and his critical remarks are discriminating and to the point. As an account of the 'Liber Studiorum' the book is in marked contrast to the treatment which this "supreme contribution of the nineteenth century, the first great century of landscape art, to the choicest stores of pure art engraving," receives from Mr. Hamerton in the few pages given to it in his recent 'Life of Turner.' In his introduction Mr. Rawlinson gives the history of the work, and supplies the requisite general information concerning it. In the catalogue he carefully describes each plate in its order, giving a full account of the various states in which it may be found, and accompanying his description with remarks on the character and motive of the design and the quality of the execution. After going through the catalogue, comparing its descriptions with the plates themselves, we can bear testimony to its remarkable accuracy. Few works of the kind are so trustworthy.

The book is one among many recent indications of the steady increase in the interest taken in Turner's work, and of the recognition of the fact that the 'Liber Studiorum,' though it does not represent the full development and highest reach of Turner's genius, and though, through the

* 'Essays, Historical and Theological. By J. B. Mozley, D.D., late Canon of Christ Church and Regius Professor of Divinity in the University of Oxford.' 2 vols. 8vo. London: Rivingtons. 1878.

limitations inherent to its nature, it cannot exhibit some of his most remarkable qualities as an artist, is yet within its range an entirely unequalled achievement, and a record of exceptional artistic powers exercised in a field in which Turner has no rival. The fact that Turner etched nearly all, if not all, the plates himself, and that the mezzotinting added to the etched plate, if not done by his own hand, was done under his immediate and exacting supervision, gives to every good impression the character and value of an original work. No one can become familiar with the plates without, as Mr. Rawlinson justly says, gaining a strong sense of the artist's "personal presence throughout the work." The etchings themselves are of peculiar interest. They not only determine the leading lines of the subject, but they exhibit Turner's power—the result of a natural gift and of ceaseless industry—in the selection of lines at once expressive and beautiful. Alike in the delineation of the broad outlines of a landscape, whether a broken mountain chain or a placid pastoral scene, and in the delineation of the energetic and elastic growth of trees, the cleavage of rocks, the curves of the shore or the hulls of ships, Turner's line not only expresses the essential character of the scene or object, but does so under a controlling sense of the beautiful relations of each line to the others in his composition. The etching forms thus the skeleton of the piece which is clothed upon by the light and shade of the mezzotint. The union of these two modes of engraving had hardly been practised before, but there was a school of admirable mezzotint engravers in England competent to execute in the most skilful manner the work laid out for them by Turner. He himself learned the art. Some of the most beautiful plates of the Liber were engraved entirely by his own hand, and he executed wholly in mezzotint a few plates (not of the Liber series) which prove him to have been as eminent a master in that branch of engraving as in the art of etching.

The excellence of these plates, whether in the simple etching or in the completed engraving, is not obvious to the casual observer. There can be no greater error, and there is no more common one, than to suppose that the excellence of a great work of art reveals itself to every one at first inspection. All great work must be studied before it can be properly enjoyed ; the greater it is the more it must be studied. But to be serviceable this study must be intelligently guided. To such as desire to appreciate and enjoy Turner's work, and who have access to the 'Liber Studiorum' or any of the plates from it, we commend Mr. Rawlinson's book as an excellent manual of instruction.

Researches into the Early History of Mankind. By E. B. Tylor. (New York : Henry Holt & Co. 1878.)—The present edition varies but little, in amount of information and in ethnological principles, from the first issue of about twelve years ago. The great value of the work consists less in its scope and system than in the illustrations furnished of the scientific method of treating the subject. Rather than 'Researches into the Early History of Mankind,' it might be described as a guide to the manner in which such researches should be conducted. One fundamental idea pervades the whole book : a firm conviction of the unity of the human race, "and that the wide differences in the civilization and mental state of the various races of mankind are rather differences of development than of origin, rather of degree than of kind." For this development Mr. Tylor finds, so to say, a prototype in man himself, the development of the individual being typical to him of the progress of the race ; therefore Childhood is called upon to represent the "Early History of Mankind." It is unnecessary at this late day to follow in Mr. Tylor's logically successive and learned chapters the expression of this leading thought, which has to some extent determined the arrangement and sequence of his topics. We shall only remark that the "Early History of Mankind" presupposes an account of the formation and constitution of early human *society*, all the other features (utterance included) being only indispensable accessories or results arising from intercourse. Especially if we admit the unity of mankind, is society but the result of propagation of the species, and we may be permitted to doubt if in this case the development of the individual can be typical of that of the race, and whether childhood fitly represents the early times of a cluster made up of both sexes. This fact explains, however, why Mr. Tylor relegates the vital question of prohibition of marriage among kindred, and with it the question of marriage in general, to his chapter on "Remarkable Customs." It also explains his assertion that "the prohibitions of marriage among distant kindred go for least in proving connection by blood or intercourse between the distant races who practise them, as it is easy to suppose them to have grown up again and again from like grounds." Primitive marriage, nevertheless, is the first departure for the explanation of primitive society, and the institutions of early human society should be the first and principal theme of "Researches into the Early History of Mankind."

It is impossible, in a work of this class, to avoid overlooking facts and points which may be of importance for special investigations or belonging to certain geographical areas, although they could be (and perhaps should be) profitably used for ethnological purposes. Thus we miss, in Mr. Tylor's chapter on the art of making fire, the important Mexican custom of the "new fire," practised, as an act of worship, every fifty-two years. Again, the story of the two black men of Van Diemen's Land who ultimately became the twin stars might fitly be accompanied by that of Hunahpu and Xbalanqué, the twin "braves" of Guatemala. But Mr. Tylor himself has more than amply apologized for such "errors and omissions" in his introduction. We fully endorse his view that "any one who collects and groups a mass of evidence, and makes an attempt to turn it to account which may lead to something better, has, I think, a claim to be exempt from any very harsh criticism of mistakes and omissions" (p. 12).

Profile. Von Karl Hillebrand. [Vol. IV. of 'Zeiten, Völker, und Menschen.'] (Berlin : Oppenheim ; New York : B. Westermann & Co. 1878.)—The essayist is often puzzled to invent a novel and yet suitable title for a collection of miscellanies. By using the term "Profile," Hillebrand, we infer, intimates that his essays do not profess to be portraits, but merely sharp outlines against a sober background. The gallery is well selected and sufficiently diversified. Its subjects are taken chiefly from the illustrious dead : only two, Renan and Taine, are among the living ; but one, the Countess d'Agoult, is a woman. The princes of the house of Medici, Leopold I. of Tuscany, Tasso, Macchiavelli, and Gino Capponi represent Italy ; Milton represents England ; Rabelais, the age of Francis I. Besides the three already mentioned, we have Doudan, Balzac, Buloz, and Thiers from contemporary France.

These notices, whether we call them sketches or "profiles," are all interesting and suggestive. The author varies his tone, of course, but maintains his well-known freedom and breadth of view, and his intense conception of the personal element in both history and literature. Directness of expression and dislike of pedantry are, as might have been expected, everywhere manifest. The essays upon Taine, Renan, and Thiers will doubtless attract most attention. Hillebrand has a marked liking for the politician of the bourgeoisie. He sympathizes with Thiers's common sense and devotion to country. Thiers embodies, for him, a happy and uncommon union of fiery zeal with prudent tact. In the main, Hillebrand's remarks are a reaffirmation of the views he had already put forth in his 'History of France under Louis Philippe.' One position, however, is not only novel, but is of sufficient importance to be worth reproducing in the author's words. No other writer, to our knowledge, has stated it so fully or so boldly. Thiers shared with the greater part of his contemporaries the delusion that the democratic state founded by Napoleon Bonaparte admitted of freedom and self-government. His ideal was : *Le Roi règne et M. Thiers gouverne.* This delusion he did not formally abandon until 1871, just before the end of his life ; then his presidency, from 1871–3, became a dictatorship. Hillebrand concludes thus :

"No one familiar with the history of this century will deny that the rulers of France, from the First Consul down to Marshal MacMahon, have been each and all personal rulers, and that every minister, whether Martignac or Thiers, Barrot or Dufaure, Marcère or Jules Simon, who attempted to force them to keep within the limits of the constitutional fiction of a sovereign without responsibility, has been summarily thrust aside. That this personal government was not a matter of mere chance, a caprice on the part of the ruler, but a necessity of the French state as it issued from the Revolution and the Consulate—this Thiers perceived only in his seventy-sixth year, when it was proposed to make him himself a constitutional ruler with a responsible ministry, and to banish him from Parliament. He rejected the suggestion peremptorily, as Bonaparte had done before him, only in more temperate language. It was the solitary recantation of his long, eventful life. Assuredly we give him no scant measure of praise when we recognize and appreciate the frankness, the sincerity, the freedom from petty vanity involved in a man's admitting, on the verge of the grave, that he had all his life been mistaken on such a point, and that the republic—that is, the non-kingship, the responsibility of the chief magistrate—is the sole form possible in modern France" (p. 171).

We should do Hillebrand injustice by attempting to restate his analysis of Renan's philosophic genius in our meagre phraseology. His argument is twofold : the tendency of the present age is to examine and compare rather than to produce, and Renan is the spokesman of this

age by virtue of his insight and his perfect mastery of style. For Taine it is evident that Hillebrand has no strong liking. The author of the 'History of English Literature' and the 'Ancien Régime' is for him too rhetorical and too *doctrinaire*. His style, moreover, does not come up to the highest standard of French prose. The conclusion of this essay, in which Hillebrand reasserts very decidedly his own views concerning the historian's true office, will be found profitable reading.

Habitual Drunkenness, and Insane Drunkards. By J. C. Bucknill, M.D. (London and New York: Macmillan & Co.)—To any one who has been charmed with the grace of style and force of expression in Dr. Bucknill's 'Mad Folk of Shakespeare,' it will be a pleasure to find that so skilful a psychologist and so broad a humanitarian has recently written upon a question so important to our whole social life as that contained in the above title. The interest which the subject has awakened in England, of late, proceeded chiefly from reports of American success—exaggerated, Dr. Bucknill thinks—in reforming the vice or curing the disease of inebriety; and four volumes of 1,749 pages, octavo, of an exhaustive but still unfinished report of a select committee of the House of Lords attests the thoroughness with which they have entered into a study of the problem. A vice or depraved taste our author considers drunkenness to be in the vast majority of cases; and he thinks Government or State asylums for its special treatment, as a disease, failures in this country and not to be advised in England, even for the few whose craving for strong drink can be fairly attributed to actual disease. As the weak went to the wall in olden times, so now, in his opinion, are the drunkards eliminated from the race as being among the unfitted to survive. If likely to be improved, he believes they get cured (or return to decent habits, as he would say) in all but exceptional cases, nearly as well at home or with family treatment. The success of the Boston institution, at least, he certainly underrates, for there has been in that place a very gratifying result with a selected class of patients; but the Massachusetts Legislature apparently agreed with him in their theory of treatment, when they gave assistance to it (as they have not done for seven years) by helping to provide a "refuge for inebriates and means for reforming them." One of the great merits of the book is its rare impartiality, in that it contains letters and opinions of others, especially of the distinguished alienist, Dr. Clouston, who are not of the same opinion with Dr. Bucknill. That one can find the prominent views of scientific and experienced men on both sides of the question in a very readable work of 103 pages, is indeed a great recommendation in these days of large books.

Fine Arts.

THE GROWING SCHOOL OF AMERICAN WATER-COLOR ART.

THE Exhibition which closed last week has been marked by one of those impulses of attachment on the part of fashion which are the best guaranty of life for an art in this mixed world. The card with "Sold" on it was hung to one-fifth of the purchasable works, and about ten thousand dollars' worth of the catalogue prices set over to the painters' account. Important concessions had, however, to be made by the artists to secure these transfers, and probably fifteen per cent. of the price charged for the purchases was remitted. The gain to the particular art cultivated by the Society is still considerable. The bent is now taken, and a steady penetration of water-color pictures will henceforth go on in the galleries of those who have been collecting canvases only, and, what is of more consequence, in the parlors of those who have no facilities for showing off canvases. The convenience of water-color art, in fact, is that it can be seen adequately in a room comparatively dim, and people can entertain its products without scandalizing their notions of a comfortably shaded interior.

The Exhibition's black-and-white department showed a more satisfying measure of the tendencies, ambitions, and experiments of native art than the larger and strictly water-colored collection. It embraced, indeed, plenty of sheets that could not by the most charitable extension of the term be connected with water-color at all. For while a sepia or ink sketch may pretend to be a work of color and a manipulation of water, it is hard to see how the crayons, the charcoals, the wood-cuts and etchings, and all the patient knitting-work of the cedar pencil could be passed into the assembly even as the cousins german of aquarelle. Their tie to the art was simply in the fact that they were the work of painters who in the other rooms were seen fully committed to the difficulties and ceremonies of the more full-dressed representation. In the hasty or preparatory cartoon we detect the thinker in the act of inventing. Mr. Homer showed, in simple black-lead heightened with gouache, a few of his groups of little girls in attitudes of hearty naturalness, their figures relieved by shorthand indications of the banks or bridges or trees on which they leaned; and the monochrome seemed almost as adequate, in his hand, to the feeling of the situation as the definition by color. Mr. Homer's contributions were simply his budget of summer sketches made in the interior of the State, the glimpses of a hermit living in complete solitude, and summary and penetrating as the glances of a recluse who is not of the world he contemplates. They were the direct opposites of the highly-finished and intimately comprehended negro scenes he sent to the Paris Exhibition. It is understood, indeed, that the Water-Color Society merely received from him his portfolios of art stenography, with permission to choose, and that the Society quickly found they wanted all. His colored sketches, hung through the different galleries, were the diary of a few summer days of changing weather, and recorded by a touch, with inimitable conciseness, the sultry closeness of the forest, or the free escape of a windy hill-top, or the damp pressure of rain. In the West room, his circle of little rustic girl-studies, set in the different phases of hot dewy morning scenes, rather crushed and flattened the elaborate picture by Detaille which happened to be adjacent, making the careful Frenchman look flat and earthy by the splendor and luminousness of their frank daylight. In the corridor his more eccentric expressions had play. He suggested to perfection the still drubbing of windless rain without defining any rain-drops, and he gave a ghastly effect of stormy light in an ugly and true sketch called "October." But it was only in a morsel or two of his pencil-work that this artist showed himself conspicuously the draughtsman. In his black-lead and body-color he betrayed the story of his old apprenticeship to the boxwood block, and chiselled his little girls' lips and noses more definitely and purely, more like the stamp of a Greek coin, than he has learned or cares to chisel with the sable brush.

The only life-scale picture on exhibition by Mr. Shirlaw was entrusted to the medium of black-and-white, though his little landscapes, in full suits of color, were studded about the exhibition, and were original and interesting. The drawing was a portrait, one which the artist had a peculiar interest in making attractive, and showed a piquant face momentarily overcome with the fun of looking out of an old poke bonnet. The complicated anatomy of a human dimple in the act of vanishing was given with a felicity that the mere anatomist would not quickly attain; but the mere anatomist would justly object that the conception of the face as a piece of structure was not correct from any conception that has ever been admitted of the art of drawing; that the nose was a cloud or a sponge, but not a cartilage; and that the portrait altogether revealed that happy-go-lucky facility, that letting the thing go at pretty near right, which the Munich practitioners, to their stultification, are borrowing from the more irresponsible achievements of Franz Hals. Another important contributor in uncolored design, committing his rounded ideas to aquarelle and his experimental ideas to black-and-white, was Mr. Hopkinson Smith, a gentleman who is an artist only in his lost moments, having long hung on the giddy edge of amateurship with infinite peril of falling over into art proper. His effects in charcoal showed a mastery of the long verdict of tradition as to the proper mixing and stirring of a savory picture; his calm certitude as to where he should put his dark tree would have touched Sir George Beaumont; it showed black and tell-

ing in his highly effective "River-Bank." Among his tinted works there was a series called "The Home Life of the Trees," ingeniously driving into greenroom groups the *ingénues*, or eccentrics, or *pères nobles* of the woods; and artists looked with approval at his rapid and brilliant execution in the "Old Mill at Easthampton," a tribute to a beautiful town which has been latterly constituted the Barbizon of our New York painters.

Mr. La Farge, too, exhibited both in colors and in monochrome. In the latter his contribution was a cartoon of the composition for Trinity Church in Boston representing the midnight visit of Nicodemus. The attitudes and heads showed considerable character and considerable religious seriousness. The Christ expressed in his bearing the sum of knowledge and a graciousness in imparting it; the sitting guest showed the man of worldly importance taken in a teachable moment. Mr. La Farge's conception is neither common nor awkward; but we can hardly tell this painter how gladly we would observe with him the greater include the less, and the inventive and dramatic part of art go along with an adequate technical experience. It is true that the experimental look of all his pictures is not very different from a religious look. In his design the constant employ of what may be called the tremolo dissimulates the want of justness in many a thin and slurred note. His draperies wavering in uncertainty, his features and extremities shading off into a convenient smudge, are less disturbing to the sentiment of his works than a precision in wrong-doing borrowed from the first Italian fresco-painter. Yet, we cannot think it necessary to emotional art that a satisfactory ease and certainty in manufacturing hands and feet and draperies should be left to the soulless artists, such as Maclise and Merle. We should even espy with pensive satisfaction the figure of La Farge passing from the enormous studio to the classes of the Academy, a sheet of Ingres paper under its arm, and devoting to the mastery of Greek wrists and ancles those waste moments which are now employed in throwing off Oriental *bric-à-brac* worthy of Mohammed's heaven, and roses made of a breath and a blush—the roses that one dreams. The roses and Oriental wares have, indeed, been selling rapidly. Mr. La Farge can no longer use his noble boast that he has never sold a picture from an exhibition. The yellow ticket has found out the corners of his small and modest frames, and the artist can congratulate himself on being almost alone in having sold his pictures at full prices without concessions, and on having had a mercantile success with a group of works in New York commensurate with the satisfactory disposal of his studio-contents lately in the city of Boston.

Porous Plasters as applied to fine art have not, we believe, been signalized heretofore in any criticisms on artistic methods. They are not to be found, to our knowledge, in the shops of artists' material; but they will not keep out of them much longer. A use has just been found in æsthetics for these soothing but utilitarian sheets. A manufacturer of heavy papers, meant to be medicated, selected some of his leaves and applied Winsor and Newton washes to their surface, first fortifying them with the proper amount of size. The success was striking, and has set the most cultivated artists seeking with avidity the reverse side of blisters, and the sheets destined primarily for hospital employment. Mr. Colman and Mr. Swain Gifford are eagerly experimenting at present on these surfaces. The texture is strong and beautiful, regularly accented and indented with the impression of the sieve; it is white in specimens made of linen alone, and warm in others where fibres of rope are introduced; it is beautifully firm and stout, with tendencies to wrinkle and imitate old Holland that are appreciated by artists; and in fine the indication is that the poor man will soon have to go in chase of the artist, who will have got his plaster. The only painter sufficiently advanced with his tests to contribute to the exhibition pictures on this medium was Mr. Charles Parsons. His beach-views and straggling sea-side cedars were beautifully indicated, and the inspiration of his material seemed to lend him an uncommon breadth and felicity of style. The rich, marrowy-looking surface suggested more of artistic profundity than it really carried, and the new paper was seen to be a noble material for effects of a large and generalized kind.

The success of the year, however, as we before observed, was certainly with the Fortuny disciples, who were in sufficient number, and behaved strangely enough to keep all eyes fixed on them. The outbreak of Fortunism has been an old tale in Philadelphia, whose Academy exhibitions have for years been colored with the fine extravagances of Messrs. Blum and Brennan, and the devoted studies of the dead Spaniard supplied by Mr. Ferris and his son. Brennan and Blum have now removed to this city, and their contributions are regarded as a new sensation. Certainly Mr. Blum's "Flight of Storks" was a decoration and a study above the common rank, and Mr. Brennan conveyed at a stroke the full sentiment of opulent luxury in his "Affecting the Japanese," besides supplying the only good drawing in the catalogue. These artists, young and dictatorial, are fully in the ranks of the "Intransigentes." If they could they would abolish form, turn perspective topsy-turvy, and spiritualize Art to the spotless trinity of the prism. Messrs. Currier and Muhrmann are partially paraphrased in German: they both proceed from Fortuny, but they have passed over Bavaria; Mr. Currier sent from thence those vibrating chords of color which we were asked to accept as landscapes, and which were certainly the principal sensation of the exhibition. Mr. Muhrmann, who has abandoned Munich for this city, contributed among many other important works the bust-picture of a "Sixteenth Century Gentleman," which, without much extravagance in style, was a notable union of the luminous sketch and the realistically modelled finished work. In their whole exhibit, we should observe, these four contributors disported themselves in radicalisms and technicalities which made Whistler seem rather sane and commonplace.

THE LIFE OF

J. M. W. Turner, R.A.,

FOUNDED ON LETTERS AND PAPERS

Furnished by his Friends and Fellow-Academicians. By Walter Thornbury. With Illustrations, Fac-similed in Colors from Turner's Original Drawings. 12mo, $2 75.

FANNY KEMBLE'S RECORDS OF A Girlhood. Large 12mo, $2 50.

ROSCHER'S POLITICAL ECONOMY. Two vols. 8vo, $7.

*GOODHOLME'S DOMESTIC CYCLOPÆ-*dia. 8vo, $5.

"Many single articles are worth the price of the work, and there are very few households in which the compilation, as a whole, would not have a daily usefulness."—*Nation.*

LEISURE-HOUR SERIES.

(16mo, $1 each.)

HARDY'S RETURN OF THE NATIVE.

FOTHERGILL'S THE FIRST VIOLIN.

HENRY HOLT & CO., NEW YORK.

BINDER for the Nation *convenient for receiving* the current numbers, also for permanent binder. Holds one volume. Price, in cloth, 50 cents; half-cloth, 25 cents (stamps). If sent by mail, 15 cents additional. Address THE NATION, Box 25, New York.

LATELY PUBLISHED.

AUTHORIZED REPRINTS

OF THE

British Quarterly, London, Edinburgh, and Westminster Quarterly Reviews for January,

AND

Blackwood's Magazine for January and February.

Terms, delivered free: Blackwood or any one Review, $4 a year; Blackwood *and* any one Review, $7; Blackwood and two Reviews, $10; Blackwood and three Reviews, $13; any three Reviews, $10; the four Reviews, $12; Blackwood and four Reviews, $15.

City orders by letter or postal promptly attended to, numbers delivered, and bills collected without trouble to the subscriber.

THE LEONARD SCOTT PUBLISHING CO.,

41 Barclay Street, New York.

Cushing's Manual

OF PARLIAMENTARY PRACTICE.

Rules of proceeding and debate in deliberative assemblies. This is the standard authority in all the United States, and is an indispensable Hand-book for every member of a deliberative body, as a ready reference upon the formality and legality of any proceeding or debate. "The most authoritative expounder of American parliamentary law."—*Chas. Sumner.*

New edition, revised and printed from new plates, just published. Price 75 cents. For sale by all booksellers. Sent by mail on receipt of price.

THOMPSON, BROWN & CO., Publishers,

23 Hawley Street, Boston.

GEO. A. LEAVITT & CO.,

AUCTIONEERS.

The Brinley Library.

NOW ON EXHIBITION AT CLINTON HALL, BY CARD ONLY.

THE AMERICAN LIBRARY COLLECTED BY THE LATE GEORGE BRINLEY, Esq., Hartford, Conn. Part One.

The Sale will commence MONDAY, March 10. Two sessions daily, 3.30 and 7.30 P.M.

"It is no exaggeration to assert that this Catalogue describes more rare and important books relative to America than all the auctions made in New York during the last fifteen years."—*N. Y. Tribune.*

"Rare and costly books—Mr. Brinley's matchless collection of the rarest and most precious early-printed American books."—*N. Y. Times.*

The Nation.

NEW YORK, THURSDAY, MARCH 13, 1879.

The Week.

MR. S. B. CHITTENDEN has agreed with General Butler to submit a test case to the Supreme Court to decide the question whether the Treasury has a right to reissue in time of peace legal-tender greenbacks once redeemed. It is proposed to tender in payment of a debt greenbacks of the issue of 1878, or of any date since the war, and on the creditor's refusing to receive them and bringing suit, to plead the tender and then go up to the Supreme Court on a demurrer. It has been objected to this proceeding that if the Court declares the reissue constitutional nothing will be gained by the opponents of Government paper, while the inflationists will be greatly encouraged. If, on the other hand, the Court declared the reissue unconstitutional, the notes now outstanding would cease to be legal tender, and the reserve of $140,000,000 now held in this form by the National Banks would cease to be available for that purpose. The banks would, therefore, be compelled to carry them to the Treasury for redemption, and thus relieve the Secretary of nearly all his gold and force him to suspend, and the result of this would be a financial crisis of a very serious kind. But this objection seems to be something in the nature of a phantom. The banks would not need to go to the Treasury for gold, or to treat their paper reserves as invalid, unless the Treasury forced them to do so, for the law says that in case the reserve of any bank falls below the legal proportion "the Comptroller *may*, with the concurrence of the Secretary of the Treasury, appoint a receiver." The Comptroller, therefore, and the Secretary too, having discretionary power in the matter, would let the banks alone.

If these reissues by the Treasury are lawful, the country ought to know it once for all; if they are not, they ought to be stopped. The effect of an adverse decision of the Court would be to declare unconstitutional the act of the last Congress directing their reissue, to force the Secretary to cancel all greenbacks which he redeems, and to deprive those outstanding, of later date than 1866, of their legal-tender quality. But this would cause no practical inconvenience, because as long as they are redeemable in gold nobody would refuse them in payment of a debt, and, in fact, it is just possible that as the redemption of them went on they would come to bring a slight premium, owing to their convenience. No question in politics to-day is more important than the withdrawal of the Government from the banking business. It has in it the seeds of endless jobbery and corruption and extravagance, of which we have just had a foretaste in the Pension Bill, and the number of currency schemes which it would keep afloat in politics would give the politicians in and out of Congress greater power of depressing and disturbing trade and industry than they even now possess, and they possess much.

Judge Rives, of the Federal District Court in Virginia, seems to be behaving in an extraordinary manner. He has been instructing the grand jury of his court to indict a batch of Virginia county judges for not summoning negroes on the juries in their courts, under the statute which makes any officer who fails to summon any citizen to serve on a jury, "on account of race, color, or previous condition of servitude," guilty of a misdemeanor. Of course the failure to summon negroes on a jury may be on account of race, color, or previous condition of servitude, but as there might be half a dozen other reasons for it, it is impossible to prove the offence except by the officer's own confession. The statute is, in fact, absurdly drawn. To be effective it ought to prescribe that every jury shall contain a certain proportion of black men, but this the Constitutional Amendment would not have warranted. It is just possible that Judge Rives wishes to expose its inefficacy; but if this is not his design he has been making himself ridiculous. An amusing point, which would have delighted the Schoolmen, has been made by one of the Virginia papers, that as the grand jury which found the bills contained seven black men, this proved that seven white men had not been summoned on account of their race and color. The inference is, in fact, all but irresistible.

In Atlanta, Ga., the other day, a Colonel Alston was instructed by Senator Gordon to sell his interest in a contract for convict labor, which he held in common with a certain Cox, and he sold it for his friend accordingly. The sale displeased Cox, who wished to have the interest sold to another person, and he expressed his dissatisfaction by announcing that he would kill Alston if he did not break the bargain. After some days of threatening the parties met in the State Treasurer's office, and began firing at each other. Alston fell dead, and Cox is in great danger. Alston's uncle was killed in a duel, and his father soon after murdered the killer on the street, and the killer's brother then murdered the father on the street likewise. The heroes of this transaction are, it must be remembered, among the leading men in the State, and yet they have about as much regard for human life as the King of the Zulus. We mention the occurrence as an illustration of a condition of Southern society which many Northern Republicans think they can cure by Constitutional Amendments and Acts of Congress, and by appointing "Stalwart" marshals and postmasters, and which they connect in some mysterious manner with treason and rebellion. Complete amnesty has been granted, they ought now to say; Southerners are restored to all their rights under the Constitution; and yet here is Cox who kills a man because he makes a sale that does not please him.

The Board to investigate the Cheyenne massacre, which assembled at Fort Robinson at the end of January last, has concluded its report. It recommends that no further action be taken in the matter, as it was the evident desire of every one concerned to carry out the orders of the Government in the most effective and yet the most humane manner. The details of the affair, however, as related in the report itself, seem to point to a different conclusion. A large body of Cheyennes, being in great distress, and shelter having been refused them by other Indians, gave themselves up, in the spring of 1877, at Camp Robinson. In the following summer, much against their will, they were removed to Indian Territory, where they were coldly received by other Indians and suffered much from hunger, ague, and an unaccustomed climate. Finding life unbearable, as many as still had ponies set out through Kansas and Nebraska for the Red Cloud agency, the young men robbing, murdering, and cattle-lifting on the way. On reaching the Union Pacific Railroad the band divided, and soon after a party under Wild Hog was captured and taken to Fort Robinson. It seems that the soldiers who made the capture were not strong enough to disarm the Indians thoroughly, and a number of arms remained hidden about their persons, which were afterwards used in the escape. They were then shut up together in a building at Fort Robinson for about two months, and the rest is well known. It is a significant fact that these Indians sincerely preferred death to being removed to Indian Territory, and the self-slaughter of many of those who were not killed by the soldiers showed to what despair they had been brought. A few errors of judgment are attributed to the captain in charge of the guard at the time of the flight, but the Board speaks of the "proba-

bility that no one else of equal experience or judgment would have done any better," a remark which may easily be true.

Presidential aspirants who are on the alert for "movements" that may endanger their chances at the next Republican nominating convention will do well to keep an eye on Mr. Sherman. His admirers will be able to enumerate among his "claims" not only his successful achievement of resumption, but also his open advocacy and practical enforcement within his sphere of civil-service reform. Among the last executive reports to Congress it was remarked that his alone contained a reference to the subject, and more than a reference—a recommendation that the officers of his department "should have a tenure of office terminable only for cause," as in the Army and Navy, with "increased pay as a reward for long-continued and faithful service." The fulfilment of this is of course beyond his control except to a very limited extent, but he can do, and has begun to do, something to raise the standard of service by rules regulating admittance into it. These, as drawn up by the Collector, Appraiser, Surveyor, Naval Officer, and Sub-Treasurer of this city, and intended for applicants for position in the New York Custom-house and Sub-Treasury, provide that, excepting certain positions of trust and confidence, all admissions shall be to the lowest grade of any group. Applications must be made in writing, and accompanied by vouchers as to character and responsibility, and by a medical certificate as to health and physical aptitude. "Personal importunity will have no weight in favor of the applicant." Upon examination in certain specific branches, the Board of Examiners will certify the names at the head of the list, not to exceed three, from which the nomination will be made. Candidates who have passed a minimum standard of 70 per cent. may have their papers brought into competition at other examinations within a year. There will be three boards in all, consisting of three members each, with alternates, all to be approved by the Secretary of the Treasury. The heads of the several offices will form a Board of Revision and Appeal, for applicants and for members of any examining board as well; and "a number of well-known citizens" will be invited to attend freely the examinations, "and publicly certify their opinion of the thoroughness and impartiality with which they are held." Finally, all promotions will be made "from one grade to the next succeeding or higher one." These rules, which seem both equitable and efficient, will have two years' trial before the Democratic party can interfere with them. It is too much to hope that the "outs" of twenty years would respect so short-lived a tradition in opposition to the spoils system of government.

The prominent part taken by Mr. Conkling at the close of the late session of Congress in the debate on the powers of the two Houses affords another illustration of the way in which his interest in legislation has been stimulated by the loss of his custom-house. As long as he had a custom-house he apparently scorned the ordinary business of his place. It is doubtless very trying to him to find that one branch of human knowledge which he had thoroughly mastered—the Arthur-Cornell question—has become utterly useless, but he must remember that the mental discipline he acquired in mastering it will still serve him in good stead, so that the time he spent over it was not wholly wasted. It would be a graceful bit of courtesy towards a defeated enemy if the Administration were to prescribe the Arthur-Cornell case as a subject for examination to custom-house candidates under the lately revived rules. No young man could, of course, get beyond the threshold of it, but no young man could even wrestle with such a subject without a great increase of intellectual vigor.

The more Archbishop Purcell's failure is examined the worse it appears. He had at first put his estate into the hands of friendly trustees to see if they could get his affairs in order, but Father Edward's book-keeping wholly baffled them. The fullest portion of the accounts consists of memoranda on detached slips of paper, containing hastily written entries of deposits and recurring interest, and as soon as one of these was filled up it was destroyed and the totals carried forward to a new one. Some of these slips, too, having been in use for thirty years are a good deal defaced, and of the accounts of some poor depositors, who kept none of their own, there is not a trace. On Wednesday, the 5th, Father Edward made an assignment for the benefit of the Archiepiscopal creditors which covered most if not all of the Archbishop's property, but this has not prevented the bringing of suits to set aside the assignment, which are now very numerous, and even the churches into which the money was put have begun to be attached, and, in fact, the seeds of one of the most wonderful crops of interesting legal questions ever seen are being sown. There is talk of some action by the Church at large to relieve him, but the Church members are mostly poor and the amount of the liabilities is enormous. One Catholic paper speaks scornfully of the persons who are troubled by the affair, and intimates that the money was "lent to the Lord" and that at the Judgment Day Father Edward's accounts will be passed with approval.

Insurance Superintendent Smyth continues to be in hot water at Albany. Resolutions requesting him to resign and a bill to abolish his department have been introduced into the Assembly, and the Governor has transmitted a petition for the Superintendent's removal, on the ground of his having closed up a solvent concern, the Atlantic Mutual Life Insurance Company, now in the hands of a receiver. Mr. Smyth has made a plausible defence of his conduct both as regards this company and the Globe Mutual, of which we spoke last week. It cannot be questioned that the Atlantic improperly deposited a large sum in a private bank in which one of its officers was interested, and could not make good the amount when Mr. Smyth called upon it to do so; and most insurance experts will agree that a company which has reached this pass is not worth the attempt to save it—sooner or later it will go down, and the result be all the more disastrous. But by this rule the bolstering up of the Globe, on which Mr. Smyth prides himself, must equally be condemned, especially after Deputy McCall's emphatic exposure of its scandalous practices. Not only did the Superintendent give it a chance to replace its discredited investments, but he nursed it for nine months under a nominal change of management, and then produced a new balance-sheet, showing a surplus of $238,332 27, and took pains to compliment the company on its condition and flattering prospects. This service the Globe acknowledges with a grim humor in its reply to the circular issued January 16, 1879, by Mr. Smyth to the insurance companies doing business in this State, in which he asks: "Is State supervision, as conducted in the State of New York, a protection to policy-holders?" The Globe replies: "We have always believed the supervision by the government to be beneficial and a protection to the insured, having the effect to secure honesty and fidelity in the management of institutions engaged in the business of insurance." Smyth is a leading henchman of Senator Conkling, and reached his present position by way of the Post-Office.

The *Evening Post* and the *Times* have both commented in severe terms on the dilatoriness of the Joint Commission charged with the settlement of Spanish and American claims, arising out of the disturbances in Cuba. It has been sitting, they say, nine years, and of the 123 cases before it only 30 have been decided; 17 have been settled; 25 dismissed, and 48 yet remain to be considered. At this rate the *Times* thinks it will not finish the business before 1900, and makes a cutting allusion to Spanish "slowness." The *Post* remarks, with indignant surprise, that the Treaty "actually" contains "no provision which determines its limitation as to time," and talks of its delays as "sickening." Both these esteemed contemporaries will be relieved to hear that the failure to limit the duration of the Commission was intentional; that the Commission was meant to be continuing, if not permanent, in order to relieve both Governments of the labor of discussing the grievances of the American and quasi-American citizens living or holding property in Cuba; that

new cases arise and are submitted to it every month; that it is not more discreditable to it to have been sitting nine years than to the Supreme Court to have been sitting ninety years; and that if it does not finish its labors before 1900 it will be because both Governments find it a useful and efficient body.

Apropos of "esteemed contemporaries," the break-down of the great movement set on foot by the *World* several months ago to put all newspapers in this category is one of the saddest events in the history of journalism. We always felt doubtful whether, in the existing state of journalistic nature, any such scheme was practicable, or would stand the maddening strain of daily mutual comment, and our fears have been only too fully justified by the event. In short, the *World*, which seems to be edited in Heaven, has shared the fate of many other theorists. In a recent issue it was compelled, by the necessities of debate, to resort to the weapons which God and nature had put into its hands, and call the editor of the *Tribune* "truthless Jacob." It met those who criticised its course in so doing by alleging that it had no quarrel with the Terraba and Boruca Indians, "whose chiefest joy it is to gorge themselves for three consecutive calendar days on a mess of decomposed pig." Surely there is a fallacy somewhere in this argument, strong as it seems on the surface.

The New York money market has "hardened" during the week, and rates for all classes of loans have advanced 1 to 2 per cent. The immediate cause of this is the continued reduction in the bank reserve, which has brought the surplus down to $4,215,725, against $13,983,825 a year ago. The remote cause was the transfer of legal-tender notes from the banks to the Treasury on account of subscriptions for the United States 4 per cents. and settlements therefor. Foreign exchange has been strong, very near to the specie-shipping point, but no gold has been exported, although the expectation that it would be has not been without influence on the loan market. The advance in the rates for loans has not prevented subscriptions to the 4 per cent. bonds, and enough were taken to warrant the Treasury in notifying the holders of another $10,000,000 5-20s of 1867 that they will be redeemed ninety days hence. This makes $260,000,000 of these bonds called in since January 1. Accompanying the last call was a circular giving notice that, after enough more 4 per cents. have been sold to redeem the remaining $88,000,000 5-20 6 per cents., the 4 per cent bonds cannot be obtained on as favorable conditions as at present. Nor did the advance in the rates for money prevent the successful negotiation of the $3,000,000 5 per cent. gold loan of the Government of the Province of Quebec. This, as we remarked last week, is the first foreign loan ever offered in New York; the subscription price was 100 and accrued interest; within five days more than three-quarters of the bonds were taken, and the price for the remainder was advanced to 101 and accrued interest. At the Stock Exchange the week has been very dull, but all classes of securities drooped in price. General trade continues to show improvement in volume, and, it is believed, in the resulting profits. Silver was quiet at 49⅝*d.* to 49¾*d.* per oz. in London. Here the bullion value of the 412½-grain silver dollar ranged between $0.8372 and $0.8391.

The Gagging Bill, as it has been called, creating a Commission to discipline members of the Reichstag for words spoken in debate—a scheme which Prince Bismarck has stuck to with the greatest tenacity—has been defeated by an overwhelming majority, amid many angry demonstrations from its chief promoter. It is now believed that he will avenge himself by another dissolution. He was supported only by the extreme Conservatives. As a sort of compromise the majority has agreed to the organization of a Commission to examine the rules and report whether they need amendment in order to enable the house itself to check intemperance of language. Old Marshal Von Roon, who may be called the organizer of the present German army, is dead, thus further reducing the small knot of old men to whom Germany owes her military greatness.

The successor of M. Marcère in the French Ministry is M. Lepère, a friend and disciple of Gambetta's, and the Ministry may be said to have been sensibly driven towards the Left by the late crisis. The Committee of Enquiry has reported in favor of the impeachment of the De Broglie-Fourtou Cabinet, having been deeply impressed by some telegrams, apparently preparing for a *coup d'état*, which were sent by the Minister of War, General de Rochebouet, to the commanders of certain corps and divisions, among others General Ducrot. But the Ministry are strongly opposed to the impeachment as likely to plunge them into a troublesome and disturbing business, and Gambetta, if one is to judge from the utterances of his organ, the *République Française*, shares their opinion. In fact, the inconveniences of such a trial have appeared so strong that many of the moderate Republicans have wished the Ministry to make it a Cabinet question and stand or fall by it. The latest reports of the Paris correspondents show that the result of the impending vote on the report is doubtful, with the chances against its adoption. The only other threatening question, the amnesty of the Communists, has been decided favorably by a heavy majority. All persons convicted after the fall of the Commune of offences other than murder or robbery are to be pardoned and brought home from New Caledonia. The Extreme Left made a desperate fight for complete or indiscriminate amnesty, but failed.

The necessity of providing some means of applying the guarantee of the Powers to the execution of the remainder of the Treaty of Berlin is at present occupying the diplomatists, probably under the pressure of France, which has warmly taken up the cause of Greece. The last proposal is to make the ambassadors at Constantinople into a sort of tribunal, with the power of deciding every question by a majority vote. There is as yet no security felt about Eastern Rumelia, the inhabitants of which seem grossly indifferent to "British interests," refuse to be put back even under nominally Turkish rule if they can help it, and clamor perversely for union with Bulgaria. The constitution or organic law offered to the province is undoubtedly very liberal, and contains everything necessary to good government, but it does not satisfy the popular imagination, which will probably be still further excited by the spectacle of a Bulgarian Parliament sitting at Tirnova. A well-informed correspondent of the London *Times* has recently published a thorough exposure of Lord Beaconsfield's stroke of strategy in reserving the passes of the Balkans for Turkish garrisons. He shows plainly, what every one on the spot has seen from the beginning, that in case of another attack by Russia these garrisons would be caught as in a trap, inasmuch as they could be easily turned by way of Sophia, or forced to retreat through a hostile population. Sir Henry Layard has been broken down in health by the difficulties of the work of "reform," and has gone on a prolonged leave of absence. The De Tocqueville scheme of a loan secured by what is left unpledged of the customs duties has been accepted by the Porte, but England and France refuse to appoint the required Commission to receive and apply the duties unless a stronger syndicate than M. de Tocqueville has provided assumes the loan.

The Bulgarian Parliament has met amid great rejoicings at Tirnova, the single chamber of which it consists having been opened by Prince Dondukof Korsakoff. The constitution was solemnly adopted, and the new nation began its existence. The Greek is the established religion, but all creeds are free, and so is speech and the press. The Chamber is to consist of the Archbishop of Bulgaria and half the bishops, of half the judges of the Supreme Court, of half the Presidents of the District Courts and Chambers of Commerce, of deputies elected by the people, one for every twenty thousand inhabitants of both sexes, and as many more nominated by the Prince. Primary education is made compulsory, but there is no provision made as yet for schools. Parliament is to meet every year, but all changes in the constitution are to be made by a convention elected *ad hoc*.

MORE "REVOLUTION."

ACCORDING to that lively but simple patriot, Mr. William E. Chandler, who has been "hanging his banner on the outer wall" in the *Tribune*, the country is on the verge of another attempt at "revolution" by the Democrats, which is, however, to be resisted by President Hayes in a most unflinching manner by the use of the veto power. In consideration of this, Mr. Chandler proposes to forgive Mr. Hayes what has been reprehensible in his past conduct, and even lend him his support and the support of "his sisters, his cousins, and his aunts" in the Republican party. The "revolution" is to consist of the repeal by the new Congress of the Act of February, 1871, as amended by the Act of June, 1872, which provides for the appointment of supervisors of election by the United States courts on the request of ten citizens of good standing in any county or parish or Congressional district. This is really the only piece of Republican legislation looking to the control of elections or the exercise of local police powers which the Republicans now seek to preserve. There is hardly a doubt that the right to control the election of members of Congress was bestowed on the Federal Government by the Constitution, and the only objection worth consideration made to its exercise is that it has been and may be abused; but this objection will lie against the exercise of almost any Federal power. That the Republicans did not intend that this act should be an instrument of abuse or oppression or of partisan advantage is, we think, sufficiently proved by the fact that the power of appointing the supervisors is given to the United States courts, and that they are to be taken from the opposing political parties, and that it was fully discussed. On its face, in fact, the measure has all the marks of fairness and impartiality. Moreover, the power of arrest which was given to the supervisors by the Act of February, 1871, which confined the supervisors to cities of over twenty thousand, was withheld by the Act of 1872, which made them appointable in any Congressional district. In fact, if the Federal Government is to interfere in Federal elections at all, less objectionable machinery for its interference could hardly be provided. If the Democrats repeal it they will commit another of the blunders which have so often robbed them of power when it seemed all but within their grasp, and which they commit whenever they get a chance with a sort of passionate avidity. It is a blunder, too, which, grave under any circumstances, has been rendered doubly grave by the occurrences of last fall in South Carolina and Louisiana. That great frauds were committed in these two States, at least, there is no denying, and that they have seriously injured the Presidential prospects of the party is just as certain. There was only one mode of doing away with their effect, and that was the exhibition of regret for them and of a show of determination to punish them and prevent their recurrence. That no such exhibition was made was bad party strategy, but it was not half as bad as a fierce effort to repeal the one bit of Federal legislation which puts any hindrance in the way of election frauds.

But, then, all this may be true, and yet the action of the Democrats will not be "revolutionary." "Revolutionary," in the mouths of some Republicans, seems to be fast becoming a name for whatever they do not like, and it is used, too, mainly to frighten business men and create a certain amount of excitement for electioneering purposes. It will not be revolutionary for the Democratic majority in this Congress to repeal the Supervisors Act, any more than it was revolutionary to appoint the Potter Committee. Any act that one Congress has passed another Congress may repeal, if it is not an act, like the appropriation acts, absolutely necessary for carrying on the Government. Moreover, the tacking on of the repeal to the appropriation bills, reprehensible as we believe it to be, is no more reprehensible or dangerous, from a merely constitutional point of view, than the mode in which the amended bill was passed in 1872, when we denounced it, June 13, 1872, in terms which we may under the circumstances be pardoned for quoting, inasmuch as they are as applicable, *mutatis mutandis*, to what the Democrats have been recently doing, as they were then to what the Republicans were doing:

"The Senate, the Administration Ring in which was determined to secure some kind of 'force' legislation before adjournment, proceeded on Saturday to violate one of its own plain rules, which forbids the amendment of any appropriation bill by any provision not directly relating to the subject of the bill, by attaching a rider to the Sundry Civil Service Appropriation Bill making the Federal elective law, which is now only applicable to cities of over twenty thousand inhabitants, applicable to all parts of the country on the request of ten respectable inhabitants of the locality. Mr. Anthony, who was in the chair, ruled that this was no violation of the rules, just as the majority of the Robeson Committee declared that the construction of the wording of the act, which was plain as the sun at noon, was something on which lawyers might differ. The result was that the opposition were placed in the position of having either to submit to the rider or defeat the Appropriation Bill, and they accordingly 'filibustered' for hours until a compromise was effected, which sent the bill to the House. Nothing more high-handed has yet been attempted by the majority in either House, and its occurrence so soon after General Grant's nomination by acclamation is not a favorable indication. The amendment which has created all this uproar was at last passed by both houses, but it is likely to prove in practice of such very trifling value, either to the Administration or anybody else, that it is a little difficult to understand the intense and reckless eagerness with which the majority have pushed it. It simply provides that on the demand of ten citizens of good standing, in any parish, county, or Congressional district, prior to any registration of voters or election of members of Congress, the judge of the United States Circuit Court shall appoint two supervisors of election, who are to receive no pay except in cities of over twenty thousand inhabitants, whose business it shall be to be present at the voting and counting, but who shall have no powers of challenge or arrest. The restriction of their function to simple observation constitutes the concession of the majority which finally secured the passage of the amendment. The proceedings attendant on the attempt of the majority to force it on the House were so outrageous that Mr. Kelley, of Pennsylvania, himself an ardent Republican, if there be one in the country, rose in his place and denounced them as 'conduct such as he had more than a score of times sentenced men to solitary confinement and penal servitude for,' when he was on the bench."

What the history of the Act teaches us is not that the Democrats are so very dangerous, but that bad precedents, even when established by good men for good purposes, are very dangerous. When the Republicans had large majorities in both Houses between 1866 and 1873, and were indulging in all sorts of reckless legislation with regard to the South, it was impossible to obtain much attention for the consideration that they were busily forging weapons which the Democrats might some day use against them. The idea that the Democrats could ever again come into power was one, however, which the Republican leaders refused to entertain, so sure were they of holding several of the Southern States. Their dreams on this point have been rudely dispelled, and they are now confronted with Democratic majorities armed with their own weapons, and we fear thoroughly determined to use them. Those who managed the Republican party at that period are, after a brief period of seclusion, again coming to the front and calling on the faithful to rally round them. It is for the faithful to reflect seriously whether there is anything so very brilliant in the history of the party during the eight years of General Grant's Administration as to make them desire to fight the battle over again under the same leadership.

One of the most unfortunate of the precedents of that time—more unfortunate in many respects than the passage of important measures as riders to appropriation bills—was the attempt to solve the Southern problem by the aid of partisan machinery. It would be difficult to conceive of a state of facts calling more distinctly for the preservation by the National Government of the character of an impartial arbitrator or director than that presented by the South at the close of the war. The party in power owed it to the negroes, above all things, to avoid the appearance of seeking party advantage through what was done for their security and elevation. Emancipation on a great scale has nowhere succeeded without the aid of a superior and judicial-minded authority, raised above the suspicion of sinister interest in settling the new relations of the masters and the freedmen. This is the part the home governments have played towards the negroes in the West Indian Colonies, and the part the Imperial Government has played in Russia towards the emancipated

serfs. It was only in the first year after the war that our Government attempted any such rôle. As soon as Congress took the business of reconstruction in hand everybody who represented the National Government at the South, and held his appointment from Washington, whether revenue collector, postmaster, district-attorney, or marshal, appeared on the scene as a passionate partisan, eager above all things to capture votes for the party in power, and to use the newly-bestowed negro franchise as a means of keeping his own place. The result is what might have been expected. The Republican example has not only imposed on the Democrats no respect for the negro vote, and no responsibility for the negro apart from his party value, but has furnished them with plenty of excuses for using the machinery of reconstruction for the furtherance of party ends, no matter how wild or base. The negro, instead of being the ward of the nation, has become the football of politics, and all the safeguards thrown around him by the Republicans are attacked with fierceness, and with a fair appearance of justification, as merely cunning devices for keeping the Republican chiefs in enjoyment of their favorite pastime of dividing the offices. Nor is a better spirit likely to be infused into the conflict by the appearance of the Chandlers and their kind in the arena, calling the warriors to the field with the old tom-tom. The men who are to settle the questions arising out of the war, permanently and finally, must be men of different antecedents and different temper.

ARCHBISHOP PURCELL'S FAILURE.

IT is safe to say that no consequence of the panic of 1873 has been so grotesque, as well as disastrous, as the appearance of a Catholic archbishop in the character of a bankrupt savings-bank. His failure illustrates in a curious way the nature of the mania—for this is the proper word for it—which preceded the crisis and brought it about. His taking about four million dollars of poor people's money and keeping no books of account, or only very imperfect ones, and putting it all, or nearly all, into churches and monasteries and schools—or, in other words, into unproductive and practically unsalable property—is a very singular phenomenon. It is very singular, too, after making every allowance for the reverence of Catholics for high Church dignitaries, that so many people should have been found willing to trust him with their funds and should have believed in his ability to manage them safely. It is true that a feeling of respect for the financial capacity of bishops is diffused through the Church by the absolute control over the diocesan property with which they are entrusted—so absolute, indeed, that we believe they are not called on for any public accounts. The Archbishop's own views on this subject, too, were forcibly set forth in a circular which he issued in 1865 to the clergy of his diocese touching the management of church property. After showing that by the canons, by "the consent of the faithful in all ages," and by the Bible, this management "is confided to the bishops," he goes on to say:

"*Fourth.* In the discharge of this duty he [the pastor of a congregation, as representative of the bishop] may be advantageously assisted by lay counsellors selected from among men of the congregation of well-known piety, probity, intelligence, prudence, and peaceableness. The evils done the Church in the United States in times past, and the scandals given by lay trustees, have caused the Holy See and all the true friends of religion to look with disfavor on the appointment of laymen as managers of church funds. Hence it is only when care has been taken to guard against unreasonable and vain pretensions and unwarrantable assumptions of authority and dictation on their part that such appointments are allowed. They are not the owners or controllers of ecclesiastical property; they are not the representatives of the congregation, as has sometimes been supposed, but simply the assistants of the pastor in the care of the temporal affairs of the congregation."

Still, the knowledge that the Archbishop had become liable for interest on an enormous sum must have been widely spread for many years, and spread, too, in a community which is tolerably well informed, even in its most ignorant strata, about the conditions on which money can be made productive and repaid when called for; and this without exciting alarm. There is nothing in the relations of the Catholic clergy to their flocks that will account for this. The Church, especially since she lost her vast endowments, would doubtless have gladly undertaken in various countries the function of keeping and managing the savings of the poor, if there were among the faithful any strong general confidence in the financial capacity of the clergy; and this we think is true in spite of the prohibition in many dioceses of the receipt of loans or deposits by the parish priest. In fact, considering the readiness which she always has shown to undertake any duties which seemed likely to give her influence, the inference that she would have widely engaged in the banking business, if people had been willing to resort to her for this purpose, is not an unfair one. The clergy have shown great ability in accumulating church property and in managing it for church purposes, but this has not, somehow, satisfied the world that they are good financial advisers or good persons to hold money "on call."

The secret of the Archbishop's success in procuring deposits undoubtedly lay in the state of mind on the part of the public, and on the part of the lay financiers, which made possible the enormous investments in railroads during the seven years preceding 1873, and which during the same period plunged so many cities and towns into the work of making "improvements." His mental condition when receiving the deposits and promising interest on them was probably, in its vague hopefulness and dislike of dry investigation, very like that of the speculators who sold the bonds of all the now bankrupt railroads. He did not clearly know how he was to provide the interest, nor they where the earnings on which they relied were to come from; but it was "in the air" that all would go well, and that real estate would rise and traffic grow and population increase and the good times never end. Between 1870 and 1873 a large number of speculators really believed that an issue of bonds would make business for a railroad; that a bond was not simply an evidence of debt but a creator of wealth. The editors of the religious papers had a feeling about a well-engraved bond somewhat like that of the Bishop of Gloucester about the effect of the Afghan war on the people of India—that if it were sold at eighty cents on the dollar it would in some manner, however obscure or indirect, tend to the spread of spiritual truth. In those days the last thing a man did was to probe anything to the bottom. The investors mostly had a financial adviser of a sanguine disposition in whom they believed implicitly, and he in his turn was satisfied that his scheme must be a good thing because so many people were willing to put money in it. The Ohio people who carried their savings to the Archbishop doubtless in the same way were satisfied that he and Father Edward, had the means of making it pay or they would not take it, and he and Father Edward were doubtless persuaded, on their part, that they must be competent to take charge of it or people would not bring it to them. Any little doubts that may have risen in their minds were perhaps quelled readily by the contemplation of the glorious work the money was doing for the Church. But all the Masses that can be sung in all the churches in America will not suffice to drown at the Supreme Tribunal the cries of the poor whose hearts have been broken and whose trust in their fellow-men has been shaken by this tremendous calamity. Nothing in the affair is more extraordinary, in fact, than the amount of sympathy expended on the "saintly Archbishop" and Father Edward, and the amount of solicitude expressed for the possible effect of the affair on the credit of the Episcopate, compared with the amount of concern shown for the unhappy crowd who surround the doors of the Archiepiscopal residence bewailing the loss of what to a large number of them must have been their sole defence against an old age of destitution.

The truth is that nothing in the financial crisis through which the country is now passing has been so unfortunate as the blow it has given to the prudence of the poor. To create this prudence is or ought to be one of the chief objects of government and philanthropy. The civilization of a country is high or low according to the amount of it which is to be found within its borders. To en

courage the poor to save and to deny themselves in seasons of prosperity, is to promote the national welfare in the highest and best sense, as it is to raise the character of the people. The result, therefore, of the panic which is most to be regretted is not the bankruptcy of traders and corporations, and the losses of the professional classes, serious as these things are, but the diffusion among the frugal and industrious workingmen and women, through the breaking down of savings-banks and insurance companies, of the feeling that there is no use in saving, inasmuch as there is no one to whom they can safely entrust money after they have saved it. The dismal process of destroying their confidence was begun on the poor negroes by the Washington Ring in the Grant period, when they plundered the Freedmen's Savings-Bank with the thoroughness and audacity of burglars. It has been continued since by the widespread breakdown of savings-banks and life-insurance companies, largely through fraudulent management, and it may be said to have received the finishing touch in the failure of an archbishop for $4,000,000, without intelligible accounts. The worst of this mischief is that it cannot be all seen. It will drive, and has driven, thousands into habits of improvidence, and into bitterness against the whole social order under which they live, and yet they will make no sign and give no minister or philanthropist an opportunity of touching the source of their recklessness or despair.

HOW PARIS IS GOVERNED.—II.

PARIS, February 21, 1879.

THE exact relations of the Imperial or Central Government to the Municipal Council of Paris, which I described in my last letter, could not be better exemplified than by a curious incident which has just taken place and which has excited much attention. A great change has come over the temper of the Municipal Council since the resignation of Marshal MacMahon. The Councillors, being elected by universal suffrage in Paris, are, with few exceptions, of the most advanced radical school ; but under the last Administration they were checked in every direction by a very firm Prefect of the Seine. A new Prefect succeeded the Prefect who had remained under MacMahon for six years, and the Councillors tried at once to overstep the limits of their prerogatives. They passed two resolutions of great importance ; one of them was a vote of one hundred thousand francs, which were to be taken out of the municipal taxes and given to a voluntary committee of help for the Communists who will soon come back from New Caledonia ; the other resolution was a vindication of the Municipal Council, tending to place the Prefecture of Police under its direct control.

On the programme of the party which is now in power is what is called the amnesty. A law of amnesty has been brought before the Chamber ; this law is still discussed in what we call the bureaux ; the report on the law has not yet been read; the vote has not been taken on this measure, which tends to free all the men who took part in the Communist rebellion. The Municipal Council, without waiting for the decision of the Chamber and of the Senate, and treating the amnesty as an accomplished fact, voted, as I have said, one hundred thousand francs in aid of the returning Communists. It is not likely that any of them will be back in Paris under four months ; the vote of the Council was in reality what we call a manifestation—it was a screw put on the neck of the Chamber.

The Cabinet examined the question, and the Home Minister wrote to the Prefect of the Seine the following letter, which I must translate in full, as it is a curious indication of the sentiments of the Ministers as well of the necessities of the Administration :

"SIR : The Municipal Council of Paris, foreseeing the return to this town of many reprieved individuals who, during the first period of their return, will find themselves without resources, has voted a credit of one hundred thousand francs, destined to come to their help. The object in view is useful. The Government is on its side preoccupied with the best means of satisfying needs which call, for various reasons, for its solicitude. But, in the form given to its vote, the Municipal Council has violated the laws which regulate its action with regard to public relief. The municipal bodies can, undoubtedly, under the control of the central power, dispose of the communal receipts, but they can only do so under the peculiar conditions which regulate the employment and control of the fortune of the community whose agents they are. The law, in its wisdom, while it allows the Municipal Council authority to create resources for the help of the poor, has instituted a special organization for the distribution of these sums. This organization consists of the Boards of Relief (*bureaux de bienfaisance*) and (in Paris) of the Administration of Public Relief. If a municipal council cannot directly distribute the public money, it cannot *à fortiori* invest with this mission a committee set up outside of itself. The law, the jurisprudence of the Council of State and of the Court of Cassation are agreed in consecrating this principle.

"I could not, without ignoring it and without forgetting the laws of good administration, authorize the credit of which I speak under the form which has been given to it. I beg you to advise the Municipal Council of Paris of this."

On the 18th of February this letter was read to the Municipal Council by the new Prefect; a stormy discussion ensued, and the letter was sent to a special committee for examination. This examination can have no object, as the decision of the minister is final. The credit of 100,000 francs for the Communists must be struck from the budget of the city of Paris; otherwise, it will be in the power of every citizen of Paris to refuse payment of the municipal tax ; and the courts would undoubtedly stand by the Central Government, if any such conflict should arise.

I must explain here the organization of public relief in Paris. The law which regulates it is a law of the 10th of January, 1849. This service is under the charge of a director appointed by the Home Minister on the nomination of the Prefect of the Seine. He is, therefore, an officer of the Central Government. He has to organize the hospitals and to distribute the charities to the poor and sick who remain at home. He is legally the guardian of children who are abandoned, as well as of people who are completely mad. He is assisted by a council composed of twenty members, only two of whom belong to the Municipal Council, and who are chosen on a triple list of candidates. His council of surveillance has no executive powers; it can only give opinions on the questions submitted for its examination. But the doctors, surgeons, and apothecaries of the hospitals, having been appointed after examination and after public competition, as well as those who take care of the sick at home, have very independent positions; they cannot be dismissed by the director, they can only be changed by the Home Minister, with the advice of the board of surveillance.

The service of the public relief has an endowment of its own, a part of which is derived from legacies anterior to the French Revolution. It can receive legacies with the permission of the Council of State. It can receive donations. The special budget of this service for 1879 amounts, in the accounts of Paris, to the sum of 24,763,000 francs. The resources of the service amount to 12,723,000 francs ; and among these resources we find the *droit sur les pauvrès*, which is imposed on all theatres, public balls, public concerts (2,728,000 francs), a duty on the profits of the Mont-de-Piété (496,000 francs), one-fifth of the product of the sale of land for perpetual concessions in cemeteries (310,000 francs). There has always been a great outcry in the theatrical world, since I have known Paris, against the tax on the receipts of theatres, balls, and concerts; a certain percentage of the gross receipts is taken away from the directors of the theatres, and when the impresario fails, which is sometimes the case, he naturally throws all the fault on the city of Paris, which has ruined him, etc. The theatres are places of public amusement, and the tax on them has always seemed to me very natural and very just. Nobody pities much an unlucky impresario, and the three millions which the theatres pay to the hospitals every year are very well employed. All the resources which I have mentioned leave a deficit in the budget of public relief amounting to 12,000,000 francs, which are directly paid by the city of Paris and are included in the municipal tax.

We make a distinction in our relief service between hospitals and hospices ; the hospices are asylums for the old, the blind, the incurable, etc. Paris has at present one hospital bed for every 235 inhabitants, and one hospice bed for 231 inhabitants. There are, besides, many poor and sick helped at home, and the tendency of the administration is to increase as much as possible the home assistance. The administration furnishes with this view 4,362,000 francs, out of which 3,423,000 are directly paid to the *bureaux de bienfaisance* of the twenty arrondissements.

These bureaux are very useful institutions ; it is always more agreeable to exercise charity directly, but direct personal charity is liable to many errors. The inhabitants of Paris, who receive many calls for charity on account of their wealth, their position, their generosity, are in the habit of sending annually or monthly a certain sum to the *bureaux de bienfaisance* of their arrondissement. Some rich bankers or merchants send every year very large sums to the bureau ; when they receive applications for money they send the letters to the bureau, which has confidential agents called *enquêteurs* (inquest-makers), on whose report the small sums are distributed out of the fund kept at the bureau. Each

charitable person has in this way a sort of account-book at the bureau, and has all the advantage of the long experience of the *enquêteurs*. These agents of the administration know every street, every house, almost every family in their district ; they can very rapidly detect the difference between real misery and false misery ; they can supply very useful information. Some persons will always prefer to give away directly, and to make themselves the necessary enquiries ; but the agents of the administration are very discreet ; they never reveal the secrets which they know; they have professional qualities which render their services very acceptable to many people, especially those who are very busy. This private budget of the public relief—I mean the budget which arises from personal and almost daily donations to the bureaux of each arrondissement—does not figure in the accounts of the city of Paris. I have reason to believe that it is extremely large ; I only mention it because, by a clever combination, private charity has been allowed to borrow all the machinery of the public administration. It is to these bureaux that M. de Marcère alluded when he said that the money voted by the Municipal Council could not be spent by a private and irresponsible committee, but could only be paid out to the bureaux of the administration.

I have told how the administration distributes help in families through the agency of its *enquêteurs*, and of its own doctors, surgeons, etc. At the beginning of 1878 there were as many as 43,662 families, composed of 113,317 individuals, inscribed at the *contrôle* of the *bureaux de bienfaisance* (the *contrôle* is the register of the bureaux). This would make one poor to every seventeen inhabitants. But this number would be somewhat deceptive, as there are many old men registered who receive fifty, sometimes not more than ten, francs a year ; old women in the same condition, who cannot be said to be absolutely poor. They are relieved, without being miserable. Real, absolute misery is rare in Paris. The relieved families pay on the average a rent of one hundred to two hundred francs. The 113,317 registered individuals are thus distributed: 38,477 women, 23,026 men, 25,207 girls under fourteen years, and 25,607 boys.

In my next letter I will touch on the second point which has made a difficulty between the Government and the Municipal Council, the question of the police.

POPULAR SCIENCE IN GERMANY.

BERLIN, January 23, 1879.

THE distinction which Virchow insisted upon, in his famous München address, between what is to be taught and what is to be sought for, is one long observed by the most scientific German minds. Nothing is more surprising, in coming into more or less intimate personal relations with these men, than to discover in some confidential hour a system of individual conjectures respecting general and ulterior questions of human knowledge, cherished with an enthusiasm which, perhaps, has long animated all their researches, but which, out of reverence for scientific methods which they have long felt with Virchow enjoin a "certain moderation and renunciation of merely personal opinion," have never found public expression. These constitute what Lotze regards as philosophy when he defines it as merely the individual expression of general culture. "The prospect of later bringing to bear the experiences and results of a life of scientific labor upon my cherished but perhaps worthless reserve-thoughts" (*Hintergedanken*), said a young professor the other day, "makes the prospect of old age seem charming in a sense that Cicero could never know." These unfinished and private speculations find expression in Germany not, as formerly, in more or less developed philosophical systems, but in the increasing literature of popular science. The latter here is not, as so often in England and America, a narration of curious facts illustrated by a dexterous use of chalk, by cartoons, and by an array of laboratory furniture, but is more commonly a discussion of the most general inferences and hypotheses, and that with a freedom which puritanism still makes impossible in America, and with a frankness and unreserve which is later often regretted.

An admirable illustration of this may be found in the writings of Prof. Philip Spiller, who died last week at the age of eighty, and whose life was devoted to the study and teaching of natural science. His amazing industry, his wide reading, the fecundity and rapidity of thought shown in his works, have long made him, as a German review styles him, "one of the heroes of the popular *scientific mind*." In three large volumes he has elaborated a system which he terms "Etherism," and which may be fundamentally characterized as follows : The essence of all life is motion ; consciousness is best conceived as the movement of atoms and molecules in brain-cells, with the inevitable accompaniment of heat-products, electric currents, etc., as in molar motions. Hence the present tyrannical fashion of dualism is denounced as the product of shallow or timid thinking. The soul is neither supernatural nor transcendent, and thought itself is a phenomenon to be one day fully explained by the chemico-physical-mathematics of atomic oscillations. Not merely is the human body a "kinetic organization of ether," but the cosmos itself is made out of, and will later, by inevitable mechanical laws, be resolved back again into, ether, which is the "mother-lye" of the universe. Light is the magnetic polarization of ether, more or less perfect according to the color. An average human brain, he conjectures, contains about 1,200 millions of cells, to each of which is attached, on an average, four fibres. If the number of notions which make up the contents of a given brain be taken as 100,000, each will have 12,000 cells and 48,000 fibres as its province. In "instinctive moments," when the outer world is forgotten and we drift aimlessly and unconsciously in thought, then it is that the "primeval force of the world, the absolute universal will, is at the helm, and its larger logic of etherical vibrations is undisturbed by intruding sense-perceptions." All men think according to the same laws of thought because the laws of elemental motion are uniform. This antique and often violently anti-Christian pantheism is gorgeously attired with unusual graces of style, and with so many facts of modern science as to present much verisimilitude to the uncritical and unscientific reader. A popular journal speaks of Spiller's "amazing synthetic power" as a "great joy and wonder in this time of dissolution and speculation." Another, after quoting Hegel's saying that "a thinking man cannot think too highly of himself," calls Prof. Spiller's system "the culmination point of modern thought, where the thinking mind celebrates its highest triumph." His work is elsewhere spoken of as a "most original and optimistic cosmology, in spite of its atheism and materialism." Even the well-known critic, Karl Müller, dubs the author the Lessing of natural science.

Another still more amusing dreamery of popular science may be seen in several articles published within the last few weeks by Prof. Jäger, of Stuttgart, and entitled "The Discovery of the Soul." The soul, according to this naturalist, is simply (*honi soit qui mal y pense*) a smell, and consists of a "chemical composition of albumen" called *nervina*. Liver, kidneys, muscle, brain, each emit a peculiar odor which the writer's olfactory nerves readily distinguish. Each of these organs has thus its own soul, and, collectively, they constitute an aura which may rise above the threshold of consciousness, and even become offensive, as in animals and in negroes, but which more commonly is a very efficient and unconscious agent mediating the instinctive attractions and antipathies of temperaments and sexes. Thus small children recognize their parents. Not only hunger but joy, love, hate, and pain emit their own peculiar odors. In people of sanguine temperament the "soul-stuff" is most loosely bound with albumen, in choleric people more firmly. Moses discovered the scientific fact that there is a soul in the blood ; Oken that the soul, like all else in the animal body, was in the cell ; but Prof. Jäger claims priority in showing indubitably, "by a long series of scientific observations," just *what* the soul is. We commend this important discovery to novelists of the intuitive school. The likes and dislikes of the heroes and heroines of 'Counterparts,' *e. g.*, is no longer a riddle or a myth. Platonic love is not platonic, and is not love but a titillation of the nerves, or perhaps of the pigment-cells of the Schneiderian membrane.

It would be very easy to make quite an anthology of curious theories recently propounded by eminent scholars in their more exoteric but serious utterances. These have all degrees of respectability, from the harmless notion attributed to the astronomer Galle that each of the planets is inhabited by beings intelligent in proportion to its age, and that thus we may expect some day to receive visits from the superior beings of some venerable world, who have solved the problem of ethereal navigation, to that of Prof. Zöllner, in Leipsic, who, after having seen the notorious American medium, Slade, has become the dupe and, to some extent, the propagandist of spiritualism. Popular science has even found its way into the university. Du Bois-Reymond explains to weekly audiences of over a thousand students his own peculiar theories of the composition of molecular forces and of electrical action in contractile animal tissues. He insists that a relapse of the world into barbarism, or a return of the dark ages, is now rendered for ever impossible only by the development of technical and mechanical science ; yet opposes the admission of graduates of the *real*-schools into the university on equal terms with the gymnasiasts, and raises a vigorous protest against incoming "Americanisms." By this term he designates materialistic and "banausic" tenden-

cies in general, which are more specifically expressed in making money-getting the prime object of life, in love of display, and in public and private corruption. With this he contrasts "Hellenism," or the love of humanistic and scientific culture for its own sake, apart from all considerations of profit or advantage. This, he thinks, should be made the German idea.

The most popular theme of popular science in Germany, as elsewhere, is evolution; it is such a portable and convenient theory, especially where it is imperfectly understood. It solves every problem, satisfies every doubt, and puts the key of the universe into everybody's vest-pocket. The very phonetic elements of the word *Entwickelung* were recently described by a humorous writer as fitting and filling the average vocal organs more completely than any other known combination of sounds. It is said that several privy councillors have argued before the Ministry that the influence of the notion of a gradual and ascending order in the universe would eventually prove a most wholesome panacea for social democracy, and against the noxious levelling French maxim of liberty and equality. Others have attributed to popular science most of the evils of socialism. Haeckel, undismayed by Virchow's strictures, continues, more vigorously, perhaps, than ever before, to insist that the truest bond of union between facts is not a plain straight line connecting them, but the most beautiful curves that human ingenuity can draw through and between them. In a popular lecture delivered in Vienna, and just published, Haeckel goes further than ever before in maintaining that the facts upon which evolution rests have now rendered every dualistic notion for ever impossible. Atom-soul, plastidul-soul, cell-soul, and so on in genetic order, he considers as established facts. All living matter is besouled, and these elements are not stones in a building but citizens of state. The simplest molecule of protoplasm must be considered as endowed with sensations and motions, the first consisting of pleasure and pain, the last of attraction and repulsion. The majority of the younger generation of scientific men in Germany are unquestionably in sympathy with him, while it is mostly the older men who applaud the *ignorabimus* creed of Reymond, and consider Haeckel's genealogy of species scarcely more credible than is the pedigree of the Homeric heroes to the historic critic. Haeckel postulates, defines, and christens with Greek names half a score of more or less new sciences to fill the gaps in the evolutionary scheme, viz.: the culture history of animals, or the development of instinct; the genesis of physiological functions; the science of rudimentary organs; the distribution of animal-life in time and space; retrogressive and abnormal development; the science of ideal ground-forms and types; the genesis of the social, moral life, and finally the instincts of natural religion, out of the inevitable association and division of labor as found not so much among primitive mankind as among the simpler forms of animal life. He now has little to say in favor of introducing theories of evolution into the schools.

In regard to the whole bitter controversy, the sensible middle thought among scientific men now seems to be that the issue between Professor Virchow and his enthusiastic pupil was far less broad and important than the religious and, in part, the conservative press have represented. Haeckel is not a "nihilistic yet superstitious prophet of a new religion." He has never affirmed that "the true domain of faith is science and not religion"; nor, on the other hand, is there any danger, as Virchow fears, that science will be generally discredited by such harmless speculations. Neither is it true that the question of the descent of man is a question so great and on which so few facts have thus far been collected that it is not yet even ripe for logical or profitable discussion. It is not a dogma but a problem, although it is not easy to determine how much is meant by the vague exhortation to a "rational resignation, renunciation, and moderation." The question is largely speculative, and as such must long remain more or less esoteric. Virchow, in his own way, is no less evolutionist than Haeckel in his, and the real question between them is only one of method and policy.

Correspondence.

WHOLESALE RATES ON RAILWAYS.

To the Editor of The Nation:

Sir: In your article entitled "The Railway Delusion of Wholesale and Retail" (*Nation* No. 712) you say:

"Full and regular trains will more surely follow a policy which creates a multitude of moderate shippers, as will always be the case when the conditions for creating trade exist, and the transporter adopts the car-load as the only unit for wholesale rates."

This assertion is not borne out by the facts, at least in the petroleum trade, to which special reference is made in the article. Three lines of railway compete for this traffic, the Pennsylvania, the Erie, and the New York Central. Of these, at the time the Standard Oil Company were competing for the monopoly they have since secured, only the Pennsylvania Road directly entered the oil regions; the New York roads getting their oil from local roads owned or controlled by the Pennsylvania. The Pennsylvania had further advantages, as in length of haul, and in the exclusive possession of the markets of Pittsburgh, Philadelphia, and Baltimore. But it was handicapped by a fast-freight line, the Empire Transportation Company, to which had been given the sole control of its crude-oil traffic. The president of that company, a man of the most considerable ability and of unsurpassed knowledge in freight matters, held precisely the view stated in the above extract. The New York roads held precisely the contrary, and by fostering single shippers had even by the winter of 1871 secured so much of the trade, to which naturally they were not entitled, that in the famous South Improvement Company's contract they were given 45 per cent. of the whole trade; while of the remaining 55 per cent. they stipulated that the Pennsylvania Road should give five per cent. to the Baltimore and Ohio (a then threatening competitor) if necessary to secure peace.

After the failure of the South Improvement scheme, the trade was still more effectually secured to the Pennsylvania Road by the opening of the extraordinary Butler County oil-fields, the nearest rail point to which was at least fifty miles from any termini of any local road controlled by either the Erie or Central. Further, the Empire Transportation Co. bought and built an extensive series of pipe-lines connecting the wells with the Pennsylvania Road. It would be difficult to find a parallel for the complete control of the traffic thus given the Pennsylvania line. Only a persistent following of the "policy which creates a multitude of moderate shippers" could have destroyed the advantage. That policy was pursued. Large shippers were discouraged in every way—several of them ruined. Small and transient shippers were sought after with an almost childish eagerness; and the New York roads steadily gained the business. Finally the Pennsylvania Road gave in. They, too, gave exclusive privileges to one shipper; unfortunately, this shipper possessed the same rights on the New York roads. The zeal of converts is proverbial. The president of the Empire line, convinced of his error, left nothing undone to prove his conversion. The "moderate shippers" were in the way of the new favorite. The president of the Empire line saw only one hope for them. "Sell out to the Standard," he advised. It was that or ruin, and they sold.

When all competition with the Standard had been destroyed, and destroyed chiefly by the Pennsylvania Road's persistence in this policy of favoring moderate shippers, the Pennsylvania Road saw its mistake. For a shipper responsible to them for their share of the trade, they had substituted a shipper whose control of the three trunk lines enabled him to play off any two against the third. They rebelled; they offered any rate or no rate at all (oil was actually carried to New York for less than the pipeage and terminal charges), but the "moderate shipper" failed to come. Then they shipped themselves, buying in the regions and selling in the East. In less than nine months they lost, so Col. Scott has since said, over $1,500,000; and their traffic was well-nigh destroyed. The Standard Oil Company even opened a new route to Philadelphia, and into Philadelphia and Baltimore put more oil by opposition lines than the Pennsylvania Road was able to, though these are essentially Pennsylvania Railroad points. The fight ended in the destruction of the Empire Transportation—the Standard Oil Company insisting on that as a preliminary to peace. The president of the late Empire Transportation may still hold to the policy of favoring moderate shippers; but the president of the Pennsylvania Railroad has very emphatically stated (to a committee of "outside" refiners) that he does not.

So much for the facts. The theory is wrong for the reason that no business is uniform and continuous. Seasons of activity when, because there are margins, plenty of "moderate shippers" will be found, are succeeded by seasons of dulness, usually the longest, when, because there are no margins, the moderate shipper demandeth no cars. The essence of the "wholesale rate" is that the service rendered must be continuous—the cars must be kept steadily employed. And as this can only be done in depressed states of the market by a positive loss to the shipper, the "wholesale rate" is given to save him. That a railroad can make more money by keeping its cars running at a reduction from the regular tariff

than by side-tracking them to await conditions of the market warranting their use at full rates in the temporary speculations of Tom, Dick, or Harry, seems to need but to be stated.

Respectfully, W. T. S.

February 24, 1879.

[The writer has apparently missed the chief point of our railway articles. Nothing is better understood by transporters than the fact that the most efficient known method for temporarily diverting the trade of a rival is a secret reduction in rates. It is equally plain that secrecy can be best preserved when the parties to the secret are few, and that large shippers can more quickly effect an important diversion of traffic than small ones. Hence the inevitable drift of secret rates is toward large discriminations in favor of a single heavy shipper, and also toward the consequent ruin of every other party engaged in the same business. These very facts seem to us to emphasize and establish the correctness of our position, that of the few features of the railway problem which the country can safely permit its Congress to regulate, absolute publicity of tariffs and a proper limit of the wholesale rate are two of the most important.

Had national regulations on these points been in existence, the New York roads could not have employed the dangerous means which our correspondent describes. If his history is from an unbiassed standpoint, and presents an impartial view of the subject, the Pennsylvania Road seems to have had clear and correct convictions as to the proper policy which a common carrier should pursue, but under the varying stress of the secret and effective competition of its rivals to have vacillated greatly in the line of action it actually followed. This was weak. If the public permits its carrying servants to be subject to illegitimate forms of attack, it cannot justly complain if they employ illegitimate forms of defence, and under the circumstances described the Pennsylvania Railroad would have been wiser to have adhered steadily to one course or the other. We are, however, persuaded that, taking the whole of the last ten years together, it would have had more trade, better net revenues, and a far stronger hold, not only on its oil traffic but on public confidence, had it, even without statutory protection against secret and extravagant discrimination by its competitors, steadfastly adhered to public rates, alike to all car-load shippers, and sufficiently low at all times to enable such shippers to compete successfully in the common oil markets of the world.

As we understand the position to-day, every road engaged in transporting petroleum to the seaboard holds its traffic only at the pleasure of a single shipping concern, and if that party, for any real or fancied offence, or gain, or for any object whatever, so elects, it can at will utterly and instantly obliterate the oil traffic of any one of the great trunk lines. No other policy could possibly have resulted in so unsafe a condition of affairs, nor in creating so perilous a frame of mind as now exists on the part of the shipping public.

If the closing remarks of our correspondent be correct, the solitary shipper who now is so perfectly protected should show in practice that "the essence of the wholesale rate is continuous and steady employment of the cars." If he will compare the monthly shipments since this protection has been substantially completed, we fear he will find grievous fluctuations of movement, probably as great as prevailed under a different state of things. A full and accurate history of the relations from year to year of this very peculiar petroleum traffic with each and all of the railroads interested would, undoubtedly, throw a strong and scorching light upon the question we have been considering.—Ed. Nation.]

SCHOLARSHIPS AGAIN.

To the Editor of The Nation:

Sir: It was my hope that by writing on college scholarships I might lead others to consider the subject. This hope has been fulfilled, no less than four correspondents of the *Nation* having already criticised my position; and although I did not expect to find myself thus placed, like Arnold Winkelried, with four spears at once in my breast, I must yet accept the position as best I may. I ought, perhaps, to be glad that so few of my main arguments are assailed, and that some of my critics really help my cause. Thus, the "Dublin University ex-Sizar" informs me that even the sizarships of that institution are not necessarily associated with poverty, and this I am very glad to know. "B." also confirms by his own experience my impression as to the pains formerly taken to conceal the names of those holding Harvard scholarships; while the argument he bases on this fact is utterly annihilated by the fact that the concealment has now ceased. "R.'s" argument is rather too metaphysical for me to follow, but his quotation from the *Athenæum* is of value, though not conclusive. The letter of President Eliot needs more consideration, were it only from deference to his position and ability. But I wish to say, at the outset, that I have no wish to sustain a prolonged controversy in this matter, controversy being commonly an admission that a writer has not made his meaning clear in his first statement, or has not anticipated the points of objection.

It seems to me that at two different points President Eliot's statement is unsatisfactory. He assumes at the outset the whole point at issue when he classes together "the various forms of 'beneficiary' money, 'exhibitions,' loans, scholarships, and fellowships" at Harvard College as being necessarily identical. But it is not I who have taken the "scholarships" out of this class and put them on different grounds. It is President Eliot and the college authorities themselves. The recipients of "loans" do not find their names published in the Catalogue; those who have beneficiary funds are not exhorted in Mr. Eliot's report to regard it as an honor. By doing this in regard to scholarships the college authorities themselves place them on different grounds from these more direct charities, and all I ask is to see accepted the logical consequences of that position. Moreover, in this enumeration Mr. Eliot leaves out of sight the fact that there is another large class of pecuniary foundations at Harvard University, equally intended to aid poor students, and yet offered without any restriction as to poverty. If his theory of the proper mode of aid is correct, then the thirty-four "Deturs" and the ten Bowdoin prizes for composition and the five Boylston prizes for elocution might well be administered on the same plan with the scholarships, those not in need of assistance being excluded. These prizes, like the scholarships, were established for a double purpose, the encouragement of learning and the material aid of those pursuing it. Why should not the Harvard scholarships, present or future, be administered like the Bowdoin and Boylston prizes, instead of being classed with the loans and beneficiary funds? This question my opponents have not even touched.

I do not see how Mr. Eliot can fail to see—I know that some of his professors see—that by publishing the names of holders of scholarships the college authorities have placed the whole system in a wholly new attitude. For the first time within my memory the distinction between rich and poor is put in print between the covers of the Harvard Catalogue. In doing this the authorities are attempting, in my judgment, to combine impossibilities—to announce the names of certain students as among "those who need assistance," and yet to put this announcement in the light of an honor. No doubt there is a sense in which all college aids, even the humblest, are honors. No one would have a dollar from any charity fund, I suppose, unless he had the good opinion of his teachers; and yet the instinct of all sensible people would revolt against printing in the College Catalogue that John Smith, of the class of '84, had lately received a loan of twenty-five dollars. There would be the same sort of objection that would be felt towards assigning John Smith a particular seat in chapel or requiring him to wear a particular garb, as was formerly required of certain beneficiaries at English universities. Yet, if either of these last practices were introduced, it might be claimed, for aught I know, as "in the highest degree democratic" and as "a constant protest against the unworthy idea that poverty implies inferiority." It is a sufficient answer to say that the tendency of the age is strongly against all such outward and visible badges. An honor is an honor; an alms is an alms; it is useless to treat them as identical. Publish the honor as widely as you please; but as for the alms, it is better even for Harvard College to follow the scriptural injunction, and let the bestowal be in secret.

It is possible that I may have overrated the proportion of poor young men who win the English scholarships; this is a matter that can only be guessed at, and the essential point is whether the great majority is on that side—which I fully believe. It must be remembered that this phrase, "needing assistance," as I said before, is very elastic; I find it so variously interpreted by different Harvard professors that some young men obtain scholarships who really need them less than others who hesitate to apply; and different professors in England may use the word with yet greater variation. I have not the opportunity to consult Dr. Pattison's book; but I should like to examine the context of the passage

quoted, because it is well known that the author's theory of scholarships is quite unlike President Eliot's—Dr. Pattison's wish being to restrict them, so far as possible, to the young men of most distinguished talents, instead of spreading them widely, as now.

I scarcely know what President Eliot means when he speaks of Oxford and Cambridge as places for the rich and well-to-do alone, so general is the testimony to the contrary now given to the American visitor on the spot. Moreover, when he boldly assumes "*Of course* [the italics are my own] this prize-money is won by the young men who have been trained in the best schools and have secured the best private tutors," and adds, "These are privileges and helps which cannot be obtained by the poor," he surely takes far too much for granted. He must be aware that the system of scholarships in England begins with the public schools, and that a poor boy of unusual talent may thus be sometimes carried through his whole education, from the age of twelve or thirteen, without material expense to his parents. I remember that on enquiring as to the apparent prominence of young Scotchmen at Oxford, in spite of their national poverty, I was told that it was explained largely by their success in winning scholarships, first at the great public schools and then at the universities. I know that in 1872 I was present at the annual "wine-party" of the scholars of one of the best colleges in Oxford, and that they certainly made on me the collective impression of a set of bright young fellows who were making their own way in the world. At a later visit, last year, I talked the matter over with the head of one of the very foremost colleges, a most enlightened man, well known by reputation in this country, and he expressed surprise and disapprobation when I explained to him our American practice in regard to scholarships.

As to the feeling among Harvard students, I suppose that the editors of the *Crimson* may be accepted as having some authority, when they say that I have "certainly taken the side of the case which is taken by the great majority of undergraduates; in fact, we have not yet met a single one who entirely defended the present system" (*Crimson*, March 7). This may not prove my view to be correct, but it does show it to merit some attention—which, indeed, it seems likely to receive.

T. W. H.

Cambridge, Mass.

To the Editor of The Nation:

Sir: I have been both scholar and fellow in the University of Oxford, and have had good opportunities of watching the working of the open-scholarship system, and may, I hope, be permitted to make some comments on the questions raised by "T. W. H.'s" most suggestive letter, as regards England.

His facts and his inferences are, I think, quite sound; and especially is he right in holding that open competition for scholarships does not result, as President Eliot imagines, in their being monopolized by the well-to-do. To understand fully the working of the endowments, we must go farther back than "T. W. H." has gone—to the schools which send up the majority of the candidates for college scholarships. When we do so we find the open-scholarship system throughout. In the great public schools and in the smaller grammar schools scholarships are offered for open competition among boys of all ages. The poorer clergy and professional men, and often, too, the tradesmen, have thus a chance of starting their cleverer boys on the educational road, and, as it is just this sort of parent who naturally presses his son on at an early age, the scholarships, as a rule, though open, are won by boys who would undoubtedly have to give up the higher education if they did not win. I believe that a large majority of the scholarships at the great public schools and grammar schools are held by boys of this sort, and the successful candidates for open scholarships at the universities are mainly boys who have won scholarships at the schools. It is not, therefore, fair to infer with President Eliot that because the men who win open scholarships generally come from the best schools they are "in no need of aid in obtaining their education." That they are not oftener men from the poorest classes is the fault not of open competition but of the defects of primary education. This is merely a question of time. One of the prominent features of the remodelling of the primary and secondary schools of England will be the application of just this open-scholarship system to the whole scale of education, so that the poorest boy who is really clever (it is mistaken kindness to aid others) will have his chance of climbing to the top. Even as it is, it is well known that some of the highest dignitaries of the church and of the law in England at the present time have been boys of the poorest origin, who worked their way up by the help of the open-scholarship system. But here comes in just that merit of the system on which "T. W. H." rightly lays stress. If the scholarships and fellowships these men won had been alms instead of honors, would they have risen so high? Was not just this publicity and free competition the spur to the higher ambition? Was it not the warming sense of tangible and visible success over their fellows in the tussle of life that gave them the moral strength for still further successes?

Whether the system requires some modifications—such, for instance, as were proposed by Dr. Percival and have been quoted by "R."—is a question of detail. But what I am convinced of is, that the principle of open competition is not a loss to the poorer men, but a gain. My own experience confirms "T. W. H.'s" estimate of nineteen out of twenty scholars being poor men as at least approximately correct, while the moral gain to them from the open system is obvious. Dr. Pattison, whom President Eliot quotes, is hardly the fairest witness on this point, as he is one of those who would prefer endowing the research and esoteric learning of a few to increasing by a prize system the numbers of the fairly well educated. The majority of the teaching body at Oxford and of the cultivated classes in England think education the first object of the universities, and, till they find a better, approve the system of prize scholarships and prize fellowships, which, in spite of many obvious faults, has enormously multiplied the number of men of a fair standard of intellectual training.

To see how this has been brought about we must look back to the schools again. In the big public schools intellectual success means visible and tangible power. The boys who are most advanced in the school studies are made rulers over the others. But most of these boys are those who have won the school scholarships. It is just this association that makes so many young men who have stood well at their schools anxious—whether well off or the reverse—to win a scholarship at a good college when they go up to the university. Success stamps them at once as belonging to the intellectual *élite* of the undergraduates. Again, the number of candidates is large. Many fail, but have in general learned at least to work and to have a desire to stand well in examinations, which impels them to try for honors in some branch of study. The number of men who go in for honors at Oxford has, within thirty years, risen, I believe, from a small fraction to about one-half of the undergraduate body. That this is mainly due to open competition for scholarships and fellowships there can be no doubt whatever. I think, then, it may fairly be held that the "open" system does not exclude poor men, and it makes higher literary attainments more popular among the undergraduates. Now for the third point, whether it tends to promote equality of feeling. Ten years' insight into Oxford ways has made me think that there is in the English universities much more of that wholesome spirit of equality which Mr. Matthew Arnold cries for, than in English society generally. Poverty certainly carries no social stigma there, unless associated with unmanliness or vulgarity of character and manners. That this is largely due to the respect which attaches to work and success, and that this respect is due to the emulation called forth by open competition, seems to me quite clear.

With these questions, as they concern Harvard, I have no right to deal. But if, as an outsider, I may be allowed to say one word, it is that the principles of free competition and equality are so essentially "American" that *primâ facie* they would seem to be worth trying, and, if the result of such an experiment should be to diminish the sensitiveness about caste distinctions of rich and poor, and to increase the numbers of those who respect worth and try for distinction instead of "voting it *infra dig.*," it surely would be a gain.

Your obedient servant, F. A. Channing.

Boston, March 10, 1879.

Notes.

THE Duc de Broglie's 'King's Secret' will be published during this month in New York by Cassell, Petter & Galpin.——Charles Scribner's Sons have issued the English translation of Dr. Busch's 'Bismarck in the Franco-German War,' in two elegantly printed volumes. It is unnecessary to add anything to our previous criticisms on the contents of this remarkable work.——J. B. Lippincott & Co. announce that they have assumed the American agency of the London *Geographical Magazine*, the new organ of the Royal Geographical Society. They have in press a rhythmic prose translation of Virgil's 'Aeneid,' by Henry Hubbard Pierce, U.S.A.——The second volume of Prof. D. J. Hill's series of American authors will have Bryant for its subject.——A. S. Barnes & Co.

are about issuing a text-book of selections from the writings of eminent Southern authors, some of whom, like Wade Hampton and Sam Houston, are noted rather for deeds than words.——No. 72 of the Proceedings of the American Antiquarian Society is mostly occupied with a letter from Dr. Le Plongeon, and with readable "Notes on Yucatan," by his wife. The former is illustrated by a colored tracing of a wall-painting from the "funeral chamber of the Chaacmol monument" (interesting to compare with the late Dr. Habel's Central American tracings, now being published by the Smithsonian Institution, for its representation of speech like that used in English caricature—the words issuing from the mouth of the *dramatis personæ*); and the Notes, by views of buildings and scenery in Yucatan. A heliotype from a recent portrait of President Salisbury serves as a frontispiece.——A new periodical, supplementary to the *Library Journal* and the *Publisher's Weekly*, and called the *Title-Slip Registry*, has appeared (Nos. 1, 2. New York, 37 Park Row). It contains titles of new books systematically described for bibliographical purposes, and printed on one side of a thin sheet, to be cut out and pasted on cards, for library catalogues. The plan is an excellent one and of obvious economy.——Plans of the four prize drawings in the recent competition for tenement-house (or model-house) designs are published in the *Plumber and Sanitary Engineer* for March. The important subject of improved homes for workingmen has been discussed at two public meetings held in this city under the best auspices, and these will certainly be followed by practical measures of reform in which every inhabitant of a large city must feel an interest.——In No. 99 of *O Novo Mundo* is begun a reprint of a rare and famous tract, written by Padre Diogo Antonio Feijó in 1828 to prove the competence and the duty of the General Assembly of Brazil to abolish clerical celibacy. ——B. Westermann & Co. send us Part I. of the new edition of Stieler's Hand-Atlas. Of the three plates, N. W. France, N. E. Russia, and N. W. Africa, the last is wholly new and is a great improvement on Stülpnagel's antiquated map of 1848 with all its amendments. It is the work of the lamented Dr. Petermann, completed by Dr. Berghaus, and has for side-maps Senegambia, and the Sierra Leone, Gold and Slave coasts. ——We learn from the *Academy* that Sampson Low & Co. are about to bring out in eight volumes a work called 'The Hundred Greatest Men,' divided into as many classes as there are volumes, and with a portrait accompanying each life. Mr. Emerson is to furnish an introduction to one of the volumes. Also, that Wagner's 'Essays on Beethoven' are being translated by Mr. Edward Dannreuther, and will be published by W. Reeves.——We regret to record the death at Luxor, in Upper Egypt, on February 1, of Dr. Charles Appleton, founder and editor from the first of the *Academy*, his chief literary monument. Those who met him during his short visit to this country in 1875 saw in him a man of sanguine and ardent temperament, capable of giving himself wholly up to the cause which enlisted his sympathies. He edited, as one of the contributors, a volume of 'Essays on the Endowment of Research,' and he was a persistent advocate of international copyright. He had not quite completed his thirty-eighth year.——Last week died Elihu Burritt, the "learned blacksmith," who forty years ago acquired as a self-taught scholar and linguist a reputation which time did not confirm, for nothing that he produced gave evidence of a mind of more than very ordinary quality. He enlisted in numerous philanthropic enterprises, and as an advocate of peace, temperance, and emancipation did what he could to leave the world better than he found it. He was born in New Britain, Conn., in 1811.

—The aims and tendencies of the new management of the *International Review* are fairly exhibited in the March number, for which some indulgence as a beginning might properly be exacted. It opens with a short article by Mr. Edward Cary on "The Administration and Civil-Service Reform," noticeable for its pithy expression of the mortification which Mr. Hayes has inflicted upon the reformers who made his nomination possible, and for its indication of the only plan left them (in the writer's view) of attaining their end. He proposes that they should in any Federal district wherein a vacancy arises in the postal or revenue or administrative-judicial service "petition the appointing power to fill such vacancy by the promotion of such subordinate as, on reasonable evidence, shall be shown to be most fit for the duties required," and upon such appointment to ensure its confirmation, when necessary, by like measures. He would also have them organize with a view to affecting all Congressional nominations, and nominations to legislatures about to choose United States Senators; support party candidates according to their disposition towards civil-service reform, or make independent nominations, or at least "bolt." In addition to these methods, Mr. Cary would doubtless approve the time-honored yet too much neglected practice of addressing open letters to the candidate suspected of unsoundness. If his article be significant of the *Review's* attitude on this important question, not less do the elaborate papers by Mr. George Walker on "The Currency and the National Banks" and by Prof. Simon Newcomb on "The Silver Conference and the Silver Question" show the editorial leaning. Of both of them it may be said that they deserve separate reprint and wide circulation, as containing sound statistics and dispassionate argument, enforced in a singularly clear and popular manner. Mr. Walker is opposed to seeing the greenbacks made a permanent part of the circulation, still more to their being substituted for national-bank notes, which would mean "an increase of the public debt by $322,000,000." He shows how inelastic this currency must necessarily be, and that in fact it would speedily bring the business of the country to a deadlock. He also points out the impossibility of reconciling the obligation under the Resumption Act to redeem greenbacks in coin with that other of the Act of May 31, 1878, forbidding their cancellation and ordering their reissue. Prof. Newcomb discusses the report of the American delegates to the International Monetary Conference, and compares with it the report of the Swiss delegates, and then passes to an impartial and original investigation of the causes of the change in the ratio of gold and silver, and the prospect of future recovery and stability in their relative value. We have marked a number of passages for quotation for which we have no room. The whole article should be read by mono-metallists as well as bi-metallists. Professor Newcomb holds that the permanent absorption of gold by the German mint has been a more potent disturbing factor than the same nation's sale of discarded silver. Of the United States he says: "The radical change in our monetary system proposed by the silver law cannot be placed in a stronger light than by simply reflecting that this measure permitted the coinage in two months, and rendered obligatory the coinage in four months, of more silver dollars than had been previously coined since the establishment of the mint."

—There is one other political article, "Self-Government in the Territories," by Chief-Justice Wade, of Montana, which can hardly be called either exhaustive or weighty. Lighter if not light is Prof. Shaler's "Sleep and Dreams," suggestive like all this writer's excursuses from his own province, though we are inclined to regard his explanation of nightmare by the "singular sense of fear at the very bottom of consciousness" as rather metaphysical than philosophical. Mr. Sidney Lanier writes of "A Forgotten English Poet" of the sixteenth century, Bartholomew Griffin; and an anonymous writer, who evidently knows his subject thoroughly, begins a series of articles on the "Present Condition of the U. S. Navy" which should receive the prayerful consideration of a certain much-vindicated ex-Secretary.

—No more vigorous or convincing exposure of the true character of the Roach subsidy appeared anywhere than in the columns of the New York *Commercial Bulletin*. Its last article received the tribute of the following inimitable communication:

Philadelphia, March 1st 1879.

The New York Daily Com. Bulletin

I rearly am astonished to see such an article in your paper The Defeat of Roachs Subidey—.

I dont think you take much interest in the commerce of this country — —

To the disgrace of the Nation—the only American Line to Europe with only a local mail from Phila, & when in England to have to send your letters by English mails —

What this country wants is a general Subsidy-law without monoplies——

The Manufacturers and Agriculturers both want outlet for goods

Yours

Henry C Potter
Consul for Nicaragua.

On this the *Bulletin* justly remarks that consular incompetency is believed by merchants to be responsible in no small measure for the "national disgrace" referred to; and that people have learned to put a proper estimate upon the patriotism of private interest. It might have pointed out that "what this country wants" according to Consul Potter is just what it would not have got by the Roach subsidy, and just what Mr. Roach himself does *not* want and did not lobby for. Monopoly was the very essence of his raid upon the Treasury.

—The run of "Spell-bound" at "Wallack's" has not been a long one, and it has called out a very unanimous expression of unfavorable opinions from the press. Mr. Wallack has been found fault with even for allowing the play to be produced at his theatre, and it has been pointed out to him that the days of clap-trap melodrama are past and gone. That it

has not been more successful is certainly not due to lack of incident in the plot, or good acting. There are hardly more than two characters in it, *Raoul de Beaupré*, the mysterious tiger-slayer of the Himalayan prologue ; and *Gabrielle*, the unfortunate woman whom he afterwards marries. Both were well acted, the first by Mr. Wallack, who looked the part to perfection, and the second by Miss Coghlan, who looks almost any part well, and who quite distinguished herself in her acting of the blood-curdling midnight scene in the castle. As to incident, what with a hand-to-hand fight with a tiger for a lady's scarf in the prologue, a highway robbery, two murders, and a fatal duel across a table in the play, to say nothing of the accumulated horrors of *Gabrielle's* night in the castle of Beaupré and her subsequent madness, or her husband's attempted bigamy, there is quite enough in "Spell-bound" to furnish two or three ordinary plays with plots. It is somewhat wanting, it must be confessed, in character and in probability, and in the play as a whole there is a total absence of dramatic motive, though this is not true of particular scenes. The appearance of *Beaupré* in the prologue, where, as *Gabrielle* is explaining to her friend the strange sort of fascination he exercises over her, she suddenly sees him in the glass by means of which she is arranging her hair, is a genuine melodramatic touch ; and so too is the murder in the subterranean chamber, where *Beaupré* shoots down the woman whose life he intended to save, finding that she has recognized him. The simultaneous appearance of *Gabrielle* clinging to the inside of the door of the secret staircase did not strike us as on a level with the rest of the scene. Any trifling defects of this sort, however, were made up for in the last act, where the projected marriage of the count with *Suzanne* is interfered with by the unexpected resurrection of *Gabrielle*, and the gloomy and immoral career of her husband is brought to an abrupt termination by his being shot through the heart by young *De la Roche*. We confess to a pervading ignorance as to the period of the play. The names are all French ; but the scene in the Himalayas, and particularly the abundance of English-looking costumes, suggest Anglo-Saxon rule, while the moral atmosphere of the drama is that of the middle ages.

—The reason why "Spell-bound" has not been a success is, we think, perfectly explicable. We by no means believe that the taste for old-fashioned melodrama has died out. The success of such plays as the "Two Orphans" and "A Celebrated Case" proves that this is not so, and it is doubtful whether melodrama in the sense of a drama of the romantic order, in which the interest depends mainly on the development of an exciting romantic plot, will soon entirely lose its attractions. But the difficulty with "Spell-bound" is that it is rather an accumulation of incidents than a play. The principal character is a monster of depravity without one redeeming trait; and while it is perfectly true that we may become interested in a monster of depravity, there must be some sentimental reason for our becoming so. As a monster nobody is attractive, and if we except the slightly burlesque declaration, in the subterranean chamber, of his intention to reform and settle down as a quiet, law-abiding citizen, it is only *quâ* monster that the *Comte de Beaupré* appears in "Spell-bound." *Gabrielle*, too, is an unintelligible person, and her very genuine terror at the situation in which she finds herself in the castle is the only natural thing about her. If the motive of the play were an original attachment between the young *De la Roche* and *Gabrielle*, interrupted by the spell cast over her by *Raoul*, the whole ending by the liberation from the spell through his death, and marriage with *De la Roche*, "Spell-bound" would be a very good play. But this does not seem to be intended, and is certainly not made plain. Mr. Boucicault in his present use of his materials has avoided giving any motive, and deprived the play almost of all *raison d'être*. However, the materials of "Spell-bound" have already passed through several crucibles, and perhaps when they next issue from the laboratory the result will be more agreeable. There is no reason why it should not.

—The theatrical season in Paris has not been brilliant. No new play by M. Augier, M. Dumas, or M. Sardou has been brought out. The Comédie-Française has produced nothing new, relying upon revivals of M. Octave Feuillet's "Sphinx" and M. Dumas's fine comedy "Le Fils Naturel." According to M. Feuillet's usual fashion of trying a subject in a novel before risking it in a play, the "Sphinx" is made out of 'Julie de Trécœur'; and another comedy of his, taken in like manner from 'Les Amours de Philippe,' is likely soon to be played. In fact, it seems as though the novelists were capturing the French stage. M. Cherbuliez has possession of both the Odéon and the Vaudeville ; for the former M. Meilhac has prepared a version of "Samuel Brohl," and for the latter M. Maquet has adapted "Ladislas Bolski." Neither has met with better luck than befell M. de Najac's alteration of "Comte Kostia" at the Gymnase two or three years ago. At the Ambigu a dramatization of M. Émile Zola's "Assommoir" seems to have excited as much attention as the first appearance of the realistic novel itself. Its production was a solemnity which has been likened to the bringing out of Hugo's "Hernani," for, like Hugo, M. Zola has a theory of dramatic art which he sets forth in his theatrical criticisms in the *Bien Public*, and which may be roughly summarized by saying that he wants to see that same realism on the stage which he has already applied to the novel. He has three times put this to the proof by appearing as a dramatic author, and as many times has failed. He has not now dramatized his own novel ; this has been done by two expert theatrical hacks. M. Sarcey in the *Temps* says that the piece raises no literary questions, and is very easy to judge ; it is simply one of those plays of which the sole criticism needed is to record whether it pleased or bored the public ; it has no higher views. "The name of M. Zola and his noisily-paraded pretension of creating a new theory of theatrical art ought not to delude us. 'L'Assommoir' will regenerate nothing ; it is a play like many we have seen and shall see again." M. Sarcey then points out that the first half of the piece is light and gay, and that the final scenes are monotonous and wearisome when they are not revolting. M. Zola has recently published in a single volume the three plays written by himself which were summarily damned when acted, accompanying each with a preface in which he explains what his intentions were in writing it, and expresses his surprise that they were not more readily recognized. "Thérèse Raquin" is a gloomy drama ; "Les Héritiers Rabourdin" and the "Bouton de Rose" are farces a little less gloomy ; the second of the three was suggested, the author tells us, by Ben Jonson's 'Volpone.' In spite of failure M. Zola is not discouraged ; he believes in his theories and he has faith in himself. The final paragraph of his preface to this volume of 'Théâtre' contains these characteristic words :

"I publish my hissed plays and I wait. They are three—the three first soldiers of an army. When there are twenty they will make themselves respected. What I wait for is an evolution in our dramatic literature, a change of the public and of the critics in their attitude toward me, a clearer and juster appreciation of what I am and of what I mean. They have ended at last by reading my novels ; they will end by hearing my plays."

—For more than half a century the name of William Howitt, oftenest spoken in connection with that of his wife and literary helpmeet, has been familiar to English-reading peoples in two hemispheres ; and his death last week removes one of the most industrious and, in a peculiar sense, popular of writers. His early activity belongs in that period of English ferment when the education of the masses seemed the panacea of political evils ; when Brougham was publishing his 'Practical Observations on the Education of the People,' and founding the short-lived "Society for the Diffusion of Useful Knowledge"; and when *Chambers's Journal* and Knight's *Penny Magazine* sprang simultaneously into existence, without concert yet with similar aims. Later came the *People's Journal* and *Howitt's Magazine*, finally consolidated under the name of the former, with illustrations by Kenny Meadows, H. K. Browne, and W. J. Linton. Liberal, humanitarian, and democratic sentiments, sympathizing with revolutionists on the Continent, with Abolitionists in America, with religious free-thinkers everywhere, were the atmosphere in which the Howitts worked naturally and most cheerfully. They also did excellent service by their translations from Scandinavian literature and from the German, by their intimate pictures of German life and manners, and their enlightening account of the German universities, as well as by those works on their native country, descriptive, literary, and historical, which became a part of the culture of thousands of interested readers. The debt which young and old owe to the translator of Hans Christian Andersen and Fredrika Bremer, and the author of the poetical 'Sketches of Natural History,' to mention no other of her numerous works by which family life has been sweetened and morally rounded, ensures Mary Howitt, perhaps, a special remembrance (when her time comes) and special gratitude, but death has rarely attempted to sever a closer partnership of labor and fame and common usefulness. William Howitt was born in 1795.

—One would have thought that in this country and in England there were by this time societies for every object which it is conceivable that societies should wish to further ; but M. Léon Rousset, in his amusing 'À travers la Chine' (Paris : Hachette), speaks of a class as yet unknown here. It would be of no use to give the Chinese names, but from their object they might be called Societies for the Prevention of Disrespect to Manuscripts. The regard which the Chinese have for any-

thing connected with education has led them to an almost Mohammedan reverence for every scrap of written paper. These societies send round hired officials from house to house to collect writings that have become useless, and even to collect in the streets fragments of written paper that might come to a dishonorable end. These are placed in little decorated brick temples built by the societies, where from time to time they are burnt, and the ashes, carefully gathered, are thrown with due solemnity into the nearest stream of running water.

—In an essay written in 1781 by H. A. Vezin, Hanoverian Registrar in Chancery, the author speaks of the discovery, which had recently been made, that it was a violation of common sense to let corpses rot where human beings breathed the air, and that the Almighty should not be worshipped in a building under the roof of which worms were engaged in eating carrion. As the laws establishing graveyards outside the limits of the towns were meeting with much opposition, he collected a number of examples showing the danger resulting from the burial of people in churches, or in graveyards within the city walls. Thus, he cites the Abbé Girauld-Soularie, who ascribed the high death-rate among the nuns in the convent of Argentière to the fact that their drinking-water was drawn from a well which drained the churchyard. In Chelwood a person of note was to be buried in the church, and, for want of room, a grave was opened in which a man, who had died of small-pox, had been buried thirty years before. A blow from a spade broke the lid of the coffin, whereupon a dreadful stench arose. The church was crowded, and in a short time all the inhabitants, not only of this town, but of all the surrounding villages that had sent representatives to the funeral, were down with the small-pox. The essayist suggests that the periodical return of small-pox epidemics might be caused by the disturbance of the earth over some one who had died of that disease long before. In Saulieu, in Burgundy, a very stout woman was to be buried in the church. In digging her grave the coffin of a person that had been buried six weeks before was uncovered. While lowering the body one of the ropes broke, and the new coffin, striking against the old one, broke it. A horrible smell arose, so that all the people who were present ran away. One hundred and twenty children were in the church at the time to be confirmed, and of these one hundred and fourteen, together with the vicar, the priest, the grave-digger, and seventy other persons, became very ill. Several days after the grave had been closed a marriage was celebrated in this church, and immediately thereafter the bride, the groom, and sixteen others, among whom were three strangers, were attacked by the same disorder. Fortunately only eighteen died of the two hundred that were stricken. Vezin quotes a number of other cases showing how poisonous are the fumes that arise from dead bodies, and answers the objections that are made regarding interference with the rights of people in their burial grounds, by stating that no one would be permitted to recover the value of a wild beast or of a mad dog that endangered human lives in case such an animal were killed.

—An excellent illustration of the manner in which one after another of the old metaphysical illusions in regard to the life and habits of the lower animals are dispelled by the progress of scientific investigation, is afforded by Dr. Weissmann's paper on the "Migration of Birds" in the *Contemporary Review* for February. Ever since the appearance of Darwin's 'Origin of Species' the best scientific authorities have agreed in regarding instinct as "inherited habit," or, as Haeckel defines it, "a psychic habit, which, originally acquired through adaptation, in the course of generations becomes hereditary and finally appears as innate." But while many of the so-called instincts, and among them some of the most complicated, could thus be readily accounted for, even with our present imperfect knowledge of the habits of animals, other cases remained which could not be so satisfactorily explained. Conspicuous among these has hitherto been the migratory instinct; but, with the assistance of some valuable data recently supplied by Professor Palmén, Dr. Weissmann is able to show that in its general principles the phenomenon of the migration of birds is now capable of explanation with reference to known laws of nature. We now know that only those species migrate, either south in winter or north in summer, which are not able to procure sufficient food in either climate during the whole year. In the north the ground for several months is covered with snow, while in the south during the hottest months lakes and rivers dry up, vegetation withers, and insects disappear, so that famine would in both cases await the birds if they remained. The difficulty apparently lies in accounting for the *origin* of the habit of migrating. This, however, is removed as soon as we take into account the various stages of its development which we now find represented—from the resident birds, which merely make larger excursions in winter to find their food, to those which traverse somewhat greater distances, until we come to the extreme cases of birds which cross the ocean and go as far as from northern Europe to equatorial Africa. As long as the course is confined to the land it is easy to see how the annual excursions of each species may have been gradually extended as necessity required it. Birds have a very acute sense of sight and a capital memory for locality, which by constant use, by hereditary transmission, and the continued survival of the most talented individuals, has acquired a perfection which neither civilized man nor even savages can remotely rival. It is, therefore, easy for them to find their way as long as terra firma is beneath them. A good memory of locality, however, would be useless when the passage is across the sea. Nor would the fact that birds have been seen flying at a height of several miles, or the existence of the islands between Europe and Africa, account for the actions of the birds, for only some of their courses are across these islands. The past geography of this globe must here be taken into account. European birds now cross the Mediterranean at places where the continents *formerly* met. "The land has been gradually withdrawn from beneath them, and imperceptibly their flight over connecting belts of land has been changed into a passage over the sea." Dr. Weissmann concludes, therefore, that the present tracks of migratory birds are simply the old ways by which they originally spread themselves out towards the north. Only one more factor now remains to be accounted for. Who taught the birds to go south in winter, instead of north, east, or west, where they would perish? It has been repeatedly suggested that birds may have a magnetic or electric sense which guides them in the proper direction. But this theory, though not irrational in itself, is superfluous, since a well-established law of nature, natural selection, suffices to explain the whole matter. At first, it is very probable that some flocks of birds went in the wrong direction—perhaps some do so now—but all these perished from want of food, and only those survived which went south. These would naturally go the same way in the following winter, and take their young ones with them; and thus the habit of going south would gradually become an inherited impulse, and be converted into what is now known as the migratory instinct. We cannot too strongly recommend Dr. Weissmann's paper to all those who still harbor in their minds any metaphysical vagaries such as those taught by Hartmann, who would have us believe that the instincts of animals are due to a faculty of clairvoyance (*Hellsehen*) which they possess.

VON HOLST'S CONSTITUTIONAL HISTORY OF THE UNITED STATES.*

WE have given in full the titles, with their divisions and sub-divisions, of Professor von Holst's new volume—because, with what may seem an excess of system in the plan of the work, they present after all an admirable statement of the line of thought and reasoning which the author has had in his mind in composing his work. It was the conflict and the development of the organic law on the one side and radical democracy on the other, as illustrated in the political history of this country, that he wished to depict; and of this the constitutional history formed only one phase. The first great division of the work was to be devoted to the alliance and influence of State sovereignty and slavery; of this division the present volume forms the second. For some reason, in changing his publisher, the author found it necessary to change the title of his book, or rather to add a new one; for the old title is retained by the side of the new one. This has, at all events, the advantage, he says, that the scope of the work is thus more completely defined, as neither title by itself is quite adequate; the present instalment, too, is more distinctively a constitutional history than the last.

This volume consists of an introduction of twenty-four pages, and seven chapters; one upon Jackson, three upon Van Buren, one upon Tyler, one upon the slavery question, and one upon Texas. The chapter upon the "rule" (*Regierung*) of Andrew Jackson is in the main identical with the address noticed by us in the year 1874 (see the *Nation*, No. 448), with some additions in the way of notes. The reader cannot help wishing for a little more help in the way of subdivision, running titles, etc.; for of these important aids the book is wholly destitute. A table of con-

* 'Verfassung und Demokratie der Vereinigten Staaten von Amerika. Von Dr. H. von Holst, Professor an der Universität Freiburg i. B. Erster Theil. Staatensouveränetät und Sklaverei, Zweite Abtheilung: Von der Administration Jackson's bis zur Annexion von Texas.' (Also with the title: 'Verfassungsgeschichte der Vereinigten Staaten von Amerika seit der Administration Jackson's.' Erster Band.) Berlin: Verlag von Julius Springer; New York: L. W. Schmidt. 1878. 8vo, pp. 611.

tents of twelve lines is absolutely the only guide there is to a volume of over six hundred pages, and to chapters two of which number over one hundred pages each. Even one who merely reads the book through continuously would be glad of something more; and for purposes of reference, which is a principal use of a history like this, its value is seriously impaired by this deficiency.

The period embraced by this volume is that in which the rule of the Democratic party was fixed upon the country. The election of Polk, following upon the brief Whig triumph of 1840, established the decisive supremacy of this party; for the four years of Taylor and Fillmore were hardly an interruption to that long domination of the Democratic party which brought the country at last into a civil war. And side by side with the triumph of the party we have the story of its alliance with the slavery interest—the most momentous fact in the history of this period. Still more important, in a constitutional point of view, is the fact that it was in these sixteen years that the rule of party, as it has existed to the present day, was firmly established. By rule of party we do not mean rule by party; for this was the practice before Jackson, as it has been also for two hundred years in England. Rule by party is, if not an indispensable, at least a natural and legitimate feature of free government; in a healthy state of political society the party organization, selected by the people to administer its affairs, never forgets that it is but the agent of the people, and that its responsibility is to the nation and its laws. Party rule, on the other hand, as introduced by Jackson, looks to no interests but those of the party, and recognizes no responsibility but to the party. It never says it in so many words—that would be too gross; but its acts nevertheless show that, with the loudest professions of devotion to the country and of being the people's servant, it never for a moment thinks of any country or of any people, except the party. This was the principle of government which triumphed in 1828, and upon which every victorious party has acted from that day to this. No institution or custom, however unreasonable or harmful, can ever establish itself in a community without some rational cause; and it is easy to see that party rule of this type is simply an outgrowth of the old-fashioned rule by party, under the influence of the spirit of radical democracy. Nor is it hard to see how this rule *for* party degenerates still further into rule *through* party, under which we have no longer any genuine loyalty even to party, much less to country, but a pure scramble for offices and emoluments, in which every politician is "on the make." It is hard to see what lower depth party rule can sink to than this. It would be mere carping, however, to imply that our politics, at their lowest estate, have presented this aspect exclusively or even prevailingly.

Prof. von Holst has vigorously depicted party spirit and party rule as they exist among us. "Everywhere," he says, "the number is very small of those who are clearly conscious to themselves that the party is only a means to the attainment of certain ends, and not itself an end. In the United States party spirit has penetrated the entire political life more than anywhere else. For this reason the party has also here more than anywhere else won, in the conceptions of people, an existence independent of the individuals composing it. The party is the political church. Its traditions and its programme have something of the binding obligation of dogma" (p. 592). Of the practice of nominating for high office the men who have the fewest enemies—men, that is, who possess neither eminence nor marked individuality—he says: "A party which neither is held together by enthusiasm for an eminent personality, nor has a positive programme, because it dares not offer one to the heterogeneous elements of which it is composed, is really no longer a party, for opposition to the party in power can never by itself afford the basis for a party" (p. 327).

We have said that the first step from government *by* party to government *for* party is an outgrowth of radical democracy; an effort honest in the main, although violent and unenlightened, on the part of the masses to realize more completely their notion of a democratic government. Plainly enough the result, so far as the personality of the individuals who administer the government is concerned, is that described forcibly on page 84: "The undeniable fact, one which in truth lies in the most glaring light, is that from that time [the triumph of Jackson] the people began to exchange the *leadership* of a small number of statesmen and politicians of a high order for the *rule* of an ever-increasing horde of politicians of all ranks, down to the saloon-keeper who plays the politician, and the common thief in the mantle of the demagogue." That is just it, and we all know in our hearts how true it is—party is no longer an agent of administration, it is no longer even our ruler, it has become an instrument for the greed and ambition of politicians.

The process of substituting rule for party in place of rule by party is admirably described in detail in the volume before us. Its especial merit, we may say the most characteristic feature of the author's method, is the analysis of motives and influences derived from a careful and extended study of the very words of the men of that day; and, as a result, a full and luminous portrayal of the successive steps of the revolution in question. It is as if one talked with the men themselves; it is made even more comprehensible than it could have been to a contemporary; for contemporaries are bewildered by the multiplicity of ideas and expressions which fill the air, and are unable to determine which of them belong to the prevailing current of the time, which are reminiscences of something that has been outgrown, and which are mere sound, signifying nothing. But the author of this book, looking back over many years, and seeing clearly what it all ended in, is able to eliminate everything which does not belong to the great movement, and to set before us the movement itself in all its completeness and in all its details. Then he sees more than any contemporary could, even the keenest-eyed, because he has documents before him which, at the time, were seen by only a few eyes. The sentiments, the reasonings, the interests, the underhand influences at work are set before us in a masterly manner; very copious citations, moreover, in the foot-notes, enable the reader to follow every step of the analysis in the very language of the actors themselves. As we said when speaking of the address which makes the first chapter of this volume, General Jackson is shown to have been only the agent by whom the revolution was accomplished, not by any means the cause of the revolution. The spirit of radical democracy, the eager confidence of the masses in their capacity to carry on the government without training, the feeling that democracy meant government, not merely by the people, but *immediately* by the people—this spirit had been besieging the gates of government ever since the establishment of the republic, and of this spirit Andrew Jackson was the incarnation. And when it triumphed, it triumphed all at once. There is, at least, this comforting fact in the unpleasant picture presented by Professor von Holst—that we at the present day need not think our politics are deteriorated since a generation ago. Perhaps there is a larger proportion now of mere interested politicians; but it is only a difference of proportion—the system of administration set up by Jackson and Van Buren is just that which flourished under Grant. The abuses are identically the same, and the cry for reform was just as loud; often in reading these pages one would almost think it was his own day that was described.

On the whole, therefore, the reader rises from the perusal of this volume with a feeling of increased courage and hopefulness. It is true he has had many of his idols broken and his illusions dispelled; he has been taught that the good old times were fully as bad as the bad times of to-day; he has been forced to see that the giants whom he has reverenced, the Clays, Calhouns, and Websters, were as self-seeking and as capable of mean and dishonest acts as our Blaines and Tildens. It is true he can look back over weary years of fruitless efforts at reform, and there is a tone of discouragement to-day that there was not then. But it is even here that he finds his best assurance. It was the people that forced upon the country the ill-fated experiment of 1828; it was done in all the enthusiasm and hopefulness of a generous theory, and in the face of the warnings of experienced statesmen. At the present day it is different. It is nobody but the politicians now who believe in the present system of party rule, or who have any interest in keeping it up. If the people appear to acquiesce, it is only because they see no way to amend it. Both parties were forced in 1876, in the sheer necessity of self-preservation, to raise the banner of reform, to abjure publicly the principle of party rule; perhaps the next time they will find themselves forced not merely to talk but to act.

The extracts we have given will convey some notion of the strong and keen criticism, and the profound intelligence, which appear in this book. Such extracts could be multiplied almost without limit; we have space, however, for only a few. Mr. Hoar's recent article in the *North American Review* finds support in these words: "One could write a book upon the part played by the 'Rules of the House' in the history of the legislation of the country. But the shortest and emptiest chapter would treat of their employment for the fulfilment of their legitimate ends" (p. 304). The author gives high praise to General Harrison as a man of honor and integrity; and of the "hard-cider" campaign of 1840 he says: "It has been too common to find only occasion for derision and censure in all this. It should not be overlooked that under the mask of a fool's play, which was often pushed to the point of being really discreditable, there lay the honorable and warm protest of the people against a shameless party spirit aiming to depreciate and befoul genuine merit" (p. 331).

FRENCH PROTESTANTISM.*

FRENCH Protestantism, which has long manifested a worthy interest in its noble history and martyrology, is not likely to take a less interest in its past for the inspiring future that is rapidly—almost suddenly—opening before it. The little residuary Huguenot Church, a remnant left over from so many persecutions and banishments that failed quite to extirpate it, depressed with hindrances and disabilities, and distracted by the schism between orthodox and rationalist, has always had a weight and value in the commonwealth vastly out of proportion to its numbers. For these have been infinitesimal—hardly one in sixty of the population ; and yet, by every test that can try the character of different classes of a population, the Protestants show, at every fair opportunity, a magnificent superiority. Just now, for instance, their newspapers are counting up, with pardonable exultation, the great proportion of honors at the Paris Exhibition that have been carried off by Protestant artists and artisans. Their prominence in authorship and literature, and in the profession of teaching, has been admitted, and has been one ground of clerical opposition to the system of public education. But the most signal and "stunning" demonstration of how much more the French Protestants weighed than they counted, was given at the time of the reconstitution of the ministry a year ago, when, on counting the noses of the new ministry, it actually appeared that a majority of them were Protestants. The fact had no political significance whatever ; it had not come about by any contrivance. But on this very account its larger significance was the more impressive—that the 600,000 should furnish one-half the governing heads for the 36,000,000 ! At its exit, the Dufaure Ministry counted three Protestants out of the nine ; and now the Waddington Ministry numbers six Protestants (including Jules Ferry, Minister of Public Instruction, a new convert) to three more or less Catholic. Admiral Jauréguiberry is also a convert, but his change from the Catholic Church to the Protestant is of some years' standing.

Under the Republic the French Protestants possess, for the first time since the Concordat, the liberty of propagation ; and they have not been slow in feeling the sense of responsibility which this is adapted to impress. The two schools of doctrine among them, whose mutual conflicts have been sometimes acrimonious, have shown a disposition, not to compromise their respective convictions, but to act fraternally on the basis of the principles which they hold in common for the general interests of France. They have by no means reached "the end of controversy," but a visible sign of their improved temper toward each other is found in the *Journal du Protestantisme Français*, which, since last October, has been representing the common interests of both parties in its little weekly issue ; and a still more important sign of the same is expected to appear next April, when the new Protestant daily, *Le Réformateur*, "journal anti-clérical," is to make its *début* among the political journals of Paris. It has added interest, and we think it has also added strength, to the position of French Protestantism that within two or three years three or four of the most eminent leaders of the "Free Church" have returned to the Established Protestant Church from which their fathers seceded. The first of these, Pastor Bersier, is unquestionably the foremost preacher in France, of any communion. Théodore Monod, heir of a name illustrious in his communion, and a widely popular evangelist, is another. A third is M. Bost, founder and director of the noble system of charities at La Force. This accession strengthens and tends to broaden the orthodox party, which has been for some time widening both numerically and theologically.

Now, upon this conjuncture in the history of the French Protestant Church comes one of the most remarkable spontaneous religious movements known in church history. It calls itself *religious opportunism*, and does not pretend, to begin with, to be governed by religious motives at all. It is the spontaneous movement of serious, thoughtful, patriotic men, Catholics by birth, baptism, and civil registration, who are disgusted with the fanaticism of pilgrimage and miracle-mongery, and with the latest additions to the creed, and impressed with the injury to the country in the affairs of this life by the domination of the Catholic Church ; and who reason that inasmuch as it is impossible for a people to exist without some religion, and inasmuch as no man in France can effectually and definitively get out of the Roman Catholic Church except by distinctly connecting himself with some other, therefore the best solution of the religious question is for a man or a community to quit the Roman Catholic Church and join the Protestants. And it is astonishing how fast they are doing it. The movement began, if we are rightly informed, not in France, but in Belgium ; and the first conspicuous leader in it was no less a man than Émile Laveleye, the publicist, whose statistical studies had been of a nature to set the case well before his mind. Like all the rest of the "opportunists" he became at once a zealous propagandist of his principles, or rather his policy, in which he is zealously reinforced by others who act from more purely spiritual considerations. The consequence in Belgium has been, in some instances, the transfer of whole villages from the Roman to the Protestant communion, and in others the founding of flourishing congregations made up of converts from the Roman Church.

In France the movement began suddenly and spontaneously by a letter written to his bishop by M. Paul Bouchard, ex-prefect of a department in the south of France, asking him to take note of the formal withdrawal of himself and his family from the Roman communion and their adhesion to the Reformed Church. This letter, without any recent precedent in France, made no small stir in the Republic, and was received by the Protestants with a very doubtful and hesitating welcome in view of the reasons on which the act was predicated. But its seed was in itself after its kind, and the sort of fruit that sprung from it is indicated by the men who have followed M. Bouchard's example. One of the earliest was M. Renouvier, editor of *La Critique philosophique, politique, scientifique et littéraire*, who has added to his Review a Quarterly Supplement, the *Critique Religieuse*, as an organ of the new movement. With him goes M. Pillon, his associate in the Review. Another adherent is Jules Favre, who manifests his faith by occasional newspaper articles. The pamphleteer of the new party is Eugène Réveillaud, whose brochure, "La Question Religieuse et la Solution Protestante," is the best brief exposition of the reasons of the movement. These are names enough to show the character of the party. Its numbers may be guessed at from the fact, announced a few weeks since by the *Journal du Protestantisme Français*, that there are now on file in the Bureau of the Minister of Public Worship no less than forty-five applications for the organization of new congregations in the Established Protestant Church. There is no doubt that we are in the presence of a bold politico-religious movement to carry republican France over from Catholicism to the Protestant Church ; and if the open war which the Catholic clergy has waged against the Republic is the occasion of their loss in the impending contest, there will be few outside of their own communion to sympathize in their griefs.

Of the two books that have given us occasion for these remarks, the first is not new, only now issued in a new and convenient cheap edition. It has been a fruitful mother of books, no less than three smaller lives of Palissy having come forth from it since it first introduced its hero's name to the general public in 1852. There is excellent biographical art, and too much consciousness of art (how could the writer help it, being a professor of literature ?) in the construction of it ; it takes the reader forward with a continual progress, like a good novel. But it is mortifying to find the Professor of English Literature in University College, London, speaking of "eliminating valuable ideas" (p. 228) in the sense of eliciting them. It makes us blush for our common origin, and reflect what would be the expressions of an English critic if he had found the word so used by an American author.

The life of Du Plan is a valuable little book, but not fitted to be a popular one. It is a careful contribution to the history of one of the most thrilling periods in the life of "the Church in the Wilderness," and tells of the efforts of a chivalrous gentleman to obtain succor in foreign courts for the persecuted remnant of his co-religionists in the Cevennes. The English translation, made by an English descendant of this gentleman and martyr, is exceptionally well executed.

RECENT NOVELS.*

'SIGNOR MONALDINI'S NIECE' is full of the charm of Rome. The author feels, and can reproduce, the loveliness of form and color which makes it an enchanted place ; its glowing light, its soft air, its profuse succession of flowers, the steadfast beauty of the hills, the infinite variety of the Campagna, the power of its architecture, affecting the mind almost as the work of natural forces ; the varied beauty and abundance of its fountains—all these rise like visions before the reader who chances to be also a lover of Rome. Not only the wonderful city but

* 'Signor Monaldini's Niece.' (No-Name Series.) Boston : Roberts Bros. 1879.

its surroundings are familiar to this writer: the writhing olive-trees, the stately neglected buildings, the wide purple distance, the hill-sides steeped in varying light and shadow, are all used in the setting and the background of the story, and for the moment one forgets the curdling wind and the bitter outlines of the North. The *mise en scène* being so good, what are the actors? One girl with wonderful beauty and an ignorance of the world which transcends naïveté; one mysterious man of rank, who, being specially a man of the world, yet behaves with a simplicity fit for a boy; one coarse-natured family wrapped in an ignoble prosperity; one rather vague and cold-blooded artist; and around these, who are the high lights of the picture, are grouped various characters all more or less shady. We take it to be the writer's intention to protest against the usual conventional restrictions on women's freedom of action, but *elle s'y prend mal*, and almost all her characters turn out as her opponents might desire. The beautiful Camilla, Signor Monaldini's niece, walks alone through the streets of Rome, and is indignant and disgusted at the displeased comments of her relations; yet a single glance as he passes her inflames Don Filippo with an undying passion, and Camilla finds life richer and more endurable because of his existence. Camilla, whose French father seems to have inspired her with the most liberal views as to what is possible for the *jeune fille*, sickens in the uncongenial atmosphere of her uncle's house and is carried for recovery to Assisi, to be with a sort of family dependent. All the description of the town and Camilla's life there and of her hostess is charming. On her return to Rome an eccentric German lady, Baroness von Klenze, who is captivated with Camilla's beauty and distinction, invites her to spend the summer with her at Frascati. Camilla is enchanted with the prospect, and, almost before the matter is settled, Don Filippo takes an apartment in the same villa, and determines to give himself the happiness of seeing Camilla in the peace and freedom of the country, while he expects to persuade the public that he has not left Rome. For Don Filippo has a wife living, insane and never likely to recover, but likely to live as long as he; and, being a Catholic, no divorce is possible. A rejected lover of Camilla, the Count of San Claudio, who has married her cousin, discovers the arrangement at Frascati and communicates it to Signor Monaldini, who goes instantly to the villa and overwhelms Camilla with the coarsest reproaches. Camilla desires him never to speak to her again; and having lost her home in this house, and the Baroness being slightly cool in consequence of Camilla's refusal to marry her protégé, Carlile, she goes to Rome, hoping for counsel and assistance from Miss Conroy, an American lady who has appeared and disappeared in the story, and who in great poverty has given lessons. Camilla finds her in a charming apartment and the aspect of her surroundings entirely changed. She gives Camilla welcome and sympathy, and when she hears her story begs her to come and live with her, but suddenly checks herself and tells her own story first. Her apartment is provided by a lover—a married man—and she endeavors to argue that her position is blameless. Camilla recoils, and while they are talking the lover appears by a secret staircase and Camilla goes to Frascati. There comes Don Filippo, and in the midst of a talk of love and renunciation San Claudio (apparently) dashes out of the darkness, throws Camilla into a pond, and vanishes. Camilla is drowned, San Claudio kills himself, and twenty-four hours afterwards Filippo, who is watching the coffin, receives news of his wife's death. He passionately embraces the body, whereupon Camilla comes to life, and the rest is left to the reader's imagination. We believe, from internal evidence, that this book is written by an American woman; it is very clever, but its atmosphere is rather what we expect in the work of certain clever Frenchmen.

Heyse's stories have always a certain charm of freshness and actuality; the world seems wide and life various as one reads. The beauty of lake and wood and sea is vividly and simply indicated, and, above all, in his shorter stories his theories find less place, though they are sufficiently suggested. One of these stories, "L'Arrabiata," here called "The Fury," was published many years ago in this country—we believe by Putnam, in a collection of translated stories—but it comes in well here and we think it the prettiest of the four.

'Pretty Little Countess Zina' is the name which the publishers have thought fit to give to the book by Henri Gréville known as 'Les Koumiassines.' It is one of the best of the author's stories, neither tragic nor passionate, with some very agreeable and many very natural personages.

'Tales from the German of Paul Heyse.' New York: D. Appleton & Co. 1879.
'Pretty Little Countess Zina: A Russian Story. By Henry Gréville. Translated by Mary Neal Sherwood.' Philadelphia: T. B. Peterson & Brother.

"Jarl's Daughter" is a short, painful story by Mrs. Burnett. The others in the same volume are too unnatural to deserve criticism.

To describe a story by Dr. MacDonald seems a good deal like explaining that mustard has a sharp taste, or that oranges are generally orange-colored. He has written many books, and all readers of such books know his particular flavor. The proportions of story and sermon vary a little in his different books, and he formerly made more effort than now to blend the two elements. In 'Paul Faber' the sermons are given pure and simple, and though the book has the interest that inheres in honest and imaginative dealing with the most interesting subjects, the plot is very inartificial, and incidents of a very exceptional nature are used more than once in its construction. Paul Faber is an active, able atheist, whose highest life is in his profession, and the book describes his gradual conversion by means of the severe experiences of his life, applied and explained by the clergyman of the parish. He is called to see a beautiful stranger whom he finds at his second visit almost dead from loss of blood. He transfuses blood from his own arm to hers and saves her life. He falls in love with her, and, knowing nothing of her antecedents, marries her. After a time she is wrought up to confess to him that she had been another man's mistress. He rushes away and when he returns finds her gone. He endeavors to put a good face on the matter, and to go about his work as usual, but falls into a severe illness and suffers in every way, discovering, by the bye, that a little girl whom he has seen growing up in the village is an illegitimate child of his own. Mrs. Faber is all the while hidden in the neighborhood with a friend, and her husband being called in to her, again performs the operation of transfusion, *without recognizing his patient*. We see in some of the English papers enthusiastic praise of this book, and we do not profess to have said all that may be said in its favor, but we doubt if it is by books like this that men are convinced or sins abated.

Mr. De Kay's notions of Bohemia are not precisely those of Murger. His hero mildly makes change at a dry-goods shop and sees the heroine first through the railing of his desk, and his *beau moment* is when he quarrels with a shopman to save his lady from being searched as a shoplifter. The heroine, a rich and dashing young lady, living quite alone, is supposed to move in the best society of New York, but is unable to spell correctly, and when excited sings, *à haute voix*, in any company, a blasphemous camp-meeting song. The men described are the appropriate companions of such a lady; in fact, we do not remember to have seen so many odious people in so small a book. There are three or four powerful pages which describe the wanderings of Lee just before his suicide. But for these we should call the book a disastrous piece of vulgarity.

We are never thoroughly aware how full the commonplace world in which we live and move is of romance and adventure except when we dip into the thrilling evidence of a criminal trial or the pages of a work of fiction. 'His Heart's Desire' is a tale of New York life, of life on the Hudson, a river connected in our minds, to be sure, with plenty of romance in the early colonial times, but recently with nothing more exciting than daily and nightly steamboat and railroad journeys, and the residence on one side of it of a considerable number of extremely well-to-do people who are popularly supposed to represent the "old Knickerbocker" families. It is in one of these very houses, however, that the scene, or a great part of the scene, of 'His Heart's Desire' is laid; and let no one who has not read it presume upon his knowledge of the Hudson. There are so many persons in the book that we should despair of being able to enumerate them in any reasonable space; but the principal characters are these: Clement Chilton and his nephew, Philip Grey; Walden St. John and his sister, Nora St. John—a strangely beautiful woman, no longer very young but not old either, over whom there hangs a mystery; Miss Florence St. John, her niece, in love with Grey, who is in love with her but suspects her of coquetry; Colonel Etheridge, a man of the world and of pleasure, in middle life, and in love with Florence St. John; young Clarence St. John; John Wilton, a village blacksmith and philosopher with a pretty daughter, Annie Wilton, who unfortunately attracts the attention of young St. John; and finally Mr. Sistare, the villain of the story, whose heart's desire it is to marry Nora St. John, and who comes very near doing it. Clement Chilton is a mysterious and somewhat sarcastic man, who has an extremely low opinion of women and particularly of the St. John women. The book opens with a conversa-

'Jarl's Daughter, and Other Stories. By Mrs. F. H. Burnett.' Philadelphia: T. B. Peterson & Brother.
'Paul Faber, Surgeon. By George MacDonald, LL.D.' Philadelphia: J. B. Lippincott & Co. 1879.
'The Bohemian: A Tragedy of Modern Life. By Charles De Kay.' New York: Charles Scribner's Sons.
'His Heart's Desire: A Novel.' Philadelphia: J. B. Lippincott & Co. 1878.

tion between him and his nephew, in which his peculiar characteristics are brought out with some force, as one or two extracts will show. This is the way in which he looked when he first heard of Florence St. John's existence: "He had grown pale, his eyes burned like coals, his lips wore the cynical expression of his worst mood." On hearing of Philip's attachment to her, he says: "Begin to doubt her at once; a girl who, at sixteen, was ready to fall in love and pledge herself to you against your own better judgment, is probably well matured in intrigue long before this." Miss St. John has had an unfortunate history, having been deceived by a lover in her early youth, and having spent the rest of her life in concealing this early incident. Mr. Sistare, her brother's secretary, finds out some part of her story, and being determined to marry her, gradually, by threatening exposure of her secret, forces her into complete submission, when he is suddenly murdered by Annie Wilton, whose unfortunate relations with young St. John he has discovered and made use of. Annie drowns herself, and Sistare being dead, Miss St. John cannot marry him; besides which, she has been already married all the time to Clement Chilton, though this obstacle Sistare had thought removed by a palpably fraudulent divorce procured by himself. Of course, Philip Grey marries Florence, and the pretty Mrs. Archer marries old St. John, and the misery of Miss St. John's life is brought to an end by the discovery of her long-lost child, who conveniently dies at the same time, and a reconcilation with the cynical Clement, who, it seems, was a warm-hearted man after all. Such is life on the Hudson, and all we can say of it is that it is much worse than we suspected. In the hut of the lowly blacksmith and the palace of the wealthy Knickerbocker capitalist Care stands behind the chair of each one of the company assembled for the banquet, and at his touch the feast turns to ashes. Murder and suicide are quite common things on the Hudson, as are also slips of a serious character by noble ladies and humble village maidens. The men are sadly unprincipled when they are not priggish, but they are brave, handsome fellows, well qualified to break the hearts of the Knickerbocker ladies. Altogether it is a romantic though somewhat wearing life, and, if 'His Heart's Desire' gives a correct picture of it, one of which there is very little conception in New York.

Goethe and Schiller: their Lives and Works; including a Commentary on Goethe's 'Faust.' By Hjalmar H. Boyesen, Professor of German Literature in Cornell University. (New York: Charles Scribner's Sons. 1879.)—This volume contains a very readable collection of facts and opinions concerning Goethe and Schiller, and a commentary, not textual but discursive, on 'Faust.' The latter, like most commentaries on 'Faust,' takes too little account of Goethe's own utterances about his poem. Certainly it is not necessary in commenting upon a "barbaric composition," "mad stuff outside of all ordinary feelings," something "which will always remain a fragment," and is the "whole" of it "subjective," to show that every inconsistency is only apparent, nor to assume that there is a deep meaning lying hidden in every detached scene, and that it is our fault and not Goethe's if we do not grasp this meaning. Goethe often wrote not to be understood by the public but to please himself: as Lewes remarks, he had not the fear of Quarterly Reviewers before his eyes, and he declared with emphasis that he did not know himself what idea he had embodied in his 'Faust.'

Interesting as Professor Boyesen's book will prove to most persons desirous of gaining a knowledge of German literature outside of that literature itself, its value is diminished by the absence of an index, and its interest and value both are diminished by a haziness of statement contracted possibly during the author's studies of hazy German books, and fostered by an awe of Goethe and Schiller which tempts him to balance praise and blame till we know not which is meant to predominate. His criticisms are not brisk enough to impress themselves on the student's memory, and his subtlety has a perfunctory air—an air as if he were convinced that no history of German literature ought to be written without a certain quantum of subtlety, and convinced besides that subtlety and definiteness could not be coexistent.

"Goethe was the last man to attempt the writing of a creed. . . . He had too great a reverence for the truth to wish to confine it within the narrow bounds of a phrase which it must, in time, necessarily outgrow. The absolute truth, he would have said, no man can fathom and no words express, and a creed is, therefore, a mere subjective expression of what one man or a great body of men at a certain time believed" (p. 218).

"The unnaturalness of the restraints to which he [Schiller] had been subjected in his . . . early youth had inspired him with a vehement hunger for nature, by which, like Rousseau, he understood absence of civilization. . . . The nature which he now strove to approach was no longer the fictitious felicity and innocence of the savage state, but a natural civilization—a civilization ennobled and regenerated by culture and art, and untrammelled by artificial beliefs and prejudices" (p. 388).

Somewhat akin to Professor Boyesen's passion for subtlety is his fondness for accounting for what is not worth accounting for by reasons which are really no reasons at all. "He [Goethe] was a Goth, and as such could fathom all the dim profundity in a Gothic legend" (*i.e.*, the legend of 'Faust') (p. 154). "He [Faust] has recognized the progressive development of all living creatures (*die Reihe der Lebendigen*); he sees 'his brothers in air, in water, and in the silent wood.' Whether it is his love which has thus suddenly cleared his vision, or the long career of sensuous impressions through which Mephistopheles had been leading him, is difficult to determine" (p. 212). But does love, do voluptuous impressions, ever sharpen the scientific sense? "By a wide survey of the grand area of human action, Schiller gained that calm equilibrium of spirit which his friend [Goethe] had acquired by what, at times, appeared like Buddhistic absorption (!) in the immensity of nature" (p. 387). Goethe's scientific and Schiller's historical studies are here made to account for the perfection of form which finally took the place of extravagance in their writings. But is it not much more probable that whatever had been their studies, polish would finally have come with increase of years and longer practice in composition? It does with most poets. How Goethe resembles the Buddhists is not clear; we have no knowledge that they pursue the natural sciences, nor that he desired to be absorbed in the divinity.

What we mean by Professor Boyesen's awe of Goethe and Schiller will be clear from the following passage: "At a party . . . he [Schiller] drank an immoderate amount of wine, and had to be carried home to his lodgings. . . . The poet, however, though he may have indulged in occasional excesses, . . . was never unfaithful to his better nature" (p. 309). The author cites with a serious face these sentences from Schiller's "glorious letter of July 2, 1796," to Goethe. They seem to need both explanation and comment: "I shall entirely devote the next *four months* (!) to it [the study of Goethe's novel of 'Wilhelm Meister'], and with joy. . . . The beautiful relation which exists between us makes it, in a certain way, a religion with me, to make your cause my own as regards this book, *to develop whatever there is that is real in me into the clearest mirror of the spirit which breathes through this volume*" (p. 93). The italics are our own. Professor Boyesen asserts on page 164 that "It was not in Goethe's nature to philosophize," and on page 115 that "What especially dignifies" Goethe's poem of "Hermann and Dorothea," "and gives it an epic grandeur and movement, is its connection with the French Revolution." Now, as a matter of fact, Goethe is extremely fond of philosophizing, as witness innumerable passages in his prose writings, and the source of the "epic" grandeur of "Hermann and Dorothea" is certainly to be sought (we appeal to any one who has ever read the poem) very far off from the French Revolution—namely, in the metre, the Homeric epithets, etc., etc. Besides, "Hermann and Dorothea" is neither founded on any incident of the French Revolution, nor does the latter, Professor Boyesen himself informs us, come in at all in the poem except as a topic of conversation between the *dramatis personæ*.

We notice several Germanicisms and mistranslations; thus, p. 96, "romances" (*Romane*) for novels, and "pragmatical" (*pragmatisch*) for practical; p. 51, "Herrnhuttean" (the *u* is long, however) for Moravian; p. 164, Philosophers "break their heads," for philosophers puzzle their brains; p. 320, "gouty (*gichtisch*) foam bubbles," for bubbles of convulsive foam, and p. 370, "daintily timbered bed" (*zierlich gezimmertes Bett ?*), for daintily-fashioned bed.

Plans of Twenty-seven Doric Temples, taken from the best Authorities, and drawn on a Uniform Scale, by Charles H. Burr, Student in the Lawrence Scientific School, Harvard University. (Cambridge: W. L. Titus. 1878. One volume folio, twenty-two plates.)—These "plans" are ground-plans only. Most of them are complete in so far that they give each the whole perimeter of the temple represented, and all the walls and columns; though two or three are shown as slighter traces only, from which the whole scheme cannot now be inferred. The presentation of all these ground-plans, side by side, and on the same scale, for easy comparison, is obviously very interesting and very valuable to students. The immense size and elaborate plan of the great temple at Selinus, compared with the famous Parthenon, which is very much smaller, and with the scarcely less famous Temple of Theseus at Athens, which is smaller still, call attention forcibly to the extraordinary nature of

those Sicilian colonies of the Greeks, an inferior one of which produced such buildings, not singly but in groups. This book gives plans of six temples at Selinus: three of these must be the famous three which stand on a hill without the walls of the city, the smallest of them about as large as the Parthenon, or as the well-known temple of Neptune at Paestum, the largest having nearly four times the area of either of those more celebrated monuments. The two temples at Olympia are given, taken from Hirschfeld's work of a year ago, describing the excavations; and these will be of interest to those persons who have read accounts of the "Ausgrabungen" in question, while they have not Hirschfeld's book at hand. The publication before us is very simple and modest, with no pretence of title-page and fly-leaves and preface, and is, in fact, only a student's note-book or commonplace-book made public; a simple list of the plates, with the authorities for each one, is the only adjunct to them. We should have nothing but praise for this book of reference but for the need there appears of some warning to the beginner not to take all the plans as of equal authority. There is great difference between one antiquarian and another—between their opportunities, their devotion to their work, their power of accurate observation, and their candor. It should be stated, however, that in every case in which we have been able to compare the plan given with the best authorities other than the one followed, the result has been to confirm the wisdom of the choice made by our author.

Forty-six Social Twitters. By Mrs. Loftie, author of 'The Dining-Room.' (London and New York: Macmillan & Co. 1879.)—To say that this book is better than its name is saying little, for a more absurd title could hardly be devised. The 'Twitters' are forty-six short essays which appeared originally in the *Saturday Review*. They deal with a variety of small social problems, many of which are so essentially caused by English conventional rules that all the liveliness of style is needed to interest American readers. These essays also include various pleas in behalf of greater variety and freedom in women's lives, and, aside from the inevitable air of omniscience appropriate to a Saturday Reviewer, there is reason and good sense in many of the suggestions. Any one who likes to have what serves him for mental food minced beforehand will find that this preparation has some flavor, if too much is not taken at once.

Blackwood's Magazine for January and February.

Terms, delivered free: Blackwood or any one Review, $4 a year; Blackwood *and* any one Review, $7; Blackwood and two Reviews, $10; Blackwood and three Reviews, $13; any three Reviews, $10; the four Reviews, $12; Blackwood and four Reviews, $15.

City orders by letter or postal promptly attended to, numbers delivered, and bills collected without trouble to the subscriber.

THE LEONARD SCOTT PUBLISHING CO.,

41 Barclay Street, New York.

THE REIGN OF THE STOICS.—History, Religion, Maxims of Self-Control, Self-Culture, Benevolence, Justice, Philosophy. With citations of authors quoted from on each page. By F. M. Holland. Cloth, 248 pp., $1 25.

C. P. SOMERBY, Publisher, 139 Eighth Street, New York.

APRIL ATLANTIC.

CONTENTS.

Easter Hymns and Old Cloisters.
By FRANK FOXCROFT.
Irene the Missionary.
First chapters of an interesting Serial Story.
The Indian Territory.
By THEODORA R. JENNESS.
New York Theatres.
The Saga of the Quern-Stones.
By ALICE WILLIAMS BROTHERTON.
The Pension Beaurepas.
By HENRY JAMES, Jr.
A Day in Colorado.
By MARY MAPES DODGE.
New Lives of the Old Masters.
By HENRY VAN BRUNT.
A Workingman's Word on Over-Production.
By FRANK RICHARDS.
Living in London.
By RICHARD GRANT WHITE.
The Burial of the Poet.
By HENRY WADSWORTH LONGFELLOW.
Richard Henry Dana.
By JULIUS H. WARD.
The Washington Monument and Mr. Story's Design. By AN ARCHITECT.
The Contributors' Club, Reviews of Books, and Other Articles.

TERMS: $4 a year, in advance, *postage free;* 35 cents a number. With superb life-size portrait of LOWELL, WHITTIER, BRYANT, or LONGFELLOW, $5; with two portraits, $6; with three portraits, $7; with all four portraits, $8.

HOUGHTON, OSGOOD & CO., BOSTON;

21 Astor Place, New York.

B. Westermann & Co.,

524 BROADWAY, NEW YORK,

Have just issued a *NEW EDITION* of their

CATALOGUE

Of the latest and most prominent Standard Books on

Theology, Oriental Languages, Philosophy, and Education,

IN

GERMAN, LATIN, ENGLISH, FRENCH, etc., LANGUAGES.

8vo, 45 pages, price 15 cents, refunded on receipt of orders.

FOR ANY BOOK DESIRED—for newest styles of Stationery—for Photograph and Autograph Albums—for the only perfect Bookcase, portable, for those who board or change residences, or for permanent Library or Parlor use—address the undersigned. Buyers at a distance may safely send money order for goods to be selected by us at lowest prices. Mail your card plate to us. Best plate printing and wedding orders in the correct style. Send for samples and estimates. Circular describing the Portable Book-case sent to any address, and all enquiries in regard to books and stationery promptly and carefully answered. Address LOCKWOOD, BROOKS & CO., 381 Washington Street, Boston.

The Nation.

NEW YORK, THURSDAY, MARCH 20, 1879.

The Week.

MR. RANDALL has, we are happy to say, been elected Speaker without difficulty, the Greenbackers showing neither strength nor courage. He has proved himself the determined enemy of jobs and subsidies and all forms of corruption and disorder, and is as nearly a friend of sound finance as a popular Democrat can be expected to be. His competitor, Mr. Blackburn, represents nearly everything that is bad and dangerous in the tendencies of his party. The letter of acceptance he wrote when he was nominated for Congress, and which has just been disinterred to the confusion of some of his supporters, shows that there is hardly a craze of the day which has not found a lodgment in his brain. He declared himself in favor of legislation to force the circulation of silver, and to issue silver certificates; to substitute greenbacks for national-bank notes; to prohibit any further contraction of the currency, which he said was already below "the wants of trade" (money was then to be had at two per cent., and he did not know what this meant). He also denounced resumption, and advocated an income-tax for the purpose of forcing "balked capital" to share in some measure the burdens of government. The only redeeming feature in his programme was a proposal for the reform of the tariff, but of course this might mean something or nothing, coming from a person whose financial views were so hazy.

The Democrats have now a difficult task before them. They have already incurred a very disagreeable responsibility in making an extra session necessary. If they use it in trying to overcome the President's veto by means of riders to the appropriation bills, though it will not be "revolutionary," inasmuch as they will simply be following a vicious practice of their opponents, they will nevertheless disgust and alarm the country to an unusual degree, and throw away utterly whatever opportunity the remembrance of Republican shortcomings still affords them. There is at this moment nothing that would so chagrin and disconcert the "Stalwarts" as their passing the appropriation bills and going quietly home. But even if they do try to coerce the President, we would strongly advise the Republicans not to arm themselves and engage in town and county civil wars. The spring business is just opening with good prospects, and the crops have to be put in, and the fighting can be done just as well in the fall as now.

The great event of the week—if one were to judge from the newspapers and from the crowds in front of the bulletin-boards, the most important event since the war—has been the walking match in the Hippodrome for the Astley Champion Belt, won last year in London by O'Leary, an Irish-American, and now competed for by four candidates—O'Leary himself, struggling to retain it; Rowell, an Englishman; Ennis, a Chicago Irishman; and Harriman, a New-Englander. The man who first finished 500 miles within six days was to be the winner, and all who accomplished 450 miles within that period were to share in certain proportions the gate-money, which reached the enormous sum of over $40,000 net. O'Leary fell out exhausted on Wednesday, and then the struggle continued between Rowell and Ennis, Harriman having no chance and contending merely for a share in the gate-money. The reporters probably never before had such a chance for the use of their peculiar dialect, and the editors gave them full swing. Rowell came out victor, completing his 500 miles on Saturday evening, against Ennis's 475. Neither of these seems to have exhibited any very marked signs of distress, in spite of the prodigious drafts they must have been making on their vitality; but Harriman, who was really not competing with anybody, or engaged in any more honorable occupation than dragging himself round the ring in the hope of a sum of money, was a shocking and brutalizing spectacle during the last three days. He was in the last stages of exhaustion and very lame, his skin of a dark hue and drawn tightly over his cheek-bones, his eyes sunken and bloodshot, and his body greatly attenuated.

There were fears towards the end that the roughs would by some sort of foul play prevent the Englishman from completing his walk, and a strong force of police was in attendance. But his own manly bearing and the fraternization which took place on the track between himself and his competitor, and their joint kindness to the wretched Harriman, touched the hearts of the vast audience, and the match was closed in a scene of the wildest enthusiasm, the spectators jumping, running, cheering, and waving their hats and handkerchiefs. "The strong men," about whom the reporters tell us, who "cry like children" at Republican conventions when "harmony" is restored about the offices, and in churches when the debt is paid off, and in court-rooms when the girl who has shot her lover is acquitted, were present in considerable numbers, and wept copiously. In fact, this performance of theirs has now become so necessary to a really moving scene that we would suggest the formation of a company of athletic professional weepers to go out with the band for hire, and sob in each other's arms on a signal from the chair or the manager.

The House Judiciary Committee, which was directed to investigate certain charges brought against District Judge Blodgett, of the Northern District of Illinois, by three Chicago lawyers (Messrs. Cooper, Knickerbocker, and Sheldon), upon which his impeachment was demanded, made a report at the close of the last session of Congress. The two principal charges were that Judge Blodgett had corruptly conspired with A. C. Hesing to defraud the creditors of the Germania Insurance Company of Chicago, a bankrupt corporation, which held among its assets certain notes and collaterals of said Hesing worth $20,000, which Hesing was enabled by the judge to get back into his possession for $5,000; and that he had arbitrarily and unlawfully prevented the Grand Jury from bringing in an indictment against H. N. Hibbard, Register in Bankruptcy, for perjury in swearing to an untruthful statement of his official fees. As to the former charge, the Committee say that, "while the facts in the possession of the memorialists as shown in the case made by them fully justified their demand for an enquiry into the official conduct of Judge Blodgett, yet in view of all the evidence brought out in the investigation an impeachment could not be sustained on this charge." Upon all the other charges the judge is acquitted without qualification, although as to one of them the Committee imply that he may be censurable for a harsh exercise of lawful powers. The Committee were unanimous in reaching these conclusions. We notice that some of the Republican papers think that Judge Lapham owed it to his party to have brought in a minority report showing that the memorialists were *not* justified in demanding the enquiry.

There is no concealment of the fact that cases of yellow fever have occurred sporadically all winter in the Mississippi Valley, and the experience of former years points inevitably to the recurrence of the outbreak as soon as the warm weather sets in. Naturally a feeling of deep anxiety prevails throughout the entire South, where apparently little if anything has been done to repair the neglect of sanitary precautions which gave such scope to the ravages of the contagion last summer. The measure urged at the late session of Congress by Southern members to establish a national system of quarantine failed for various reasons, but more regret has been wasted upon it than was called for. Local cleanliness is of more importance than quarantine, and it is in the power of every community

that wishes to escape pestilence. We have little doubt that the national system will come in time, but the salvation of the South does not depend upon it. Congress was not, however, insensible to the need of a national board of health, and in fact passed an act creating one. It consists of seven members appointed by the President and the Senate, one medical officer from the army, navy, and Marine Hospital service, detailed by the heads of departments, and an officer representing the Department of Justice. Its duty is to obtain information on all matters affecting the public health, and to advise the Executive Departments and State governments on all questions submitted to it, or voluntarily, as it may see fit. In connection with the Academy of Science it must report to the next session of Congress a plan for a national health organization, with special attention to the subject of quarantine, both maritime and inland, and the relations of local systems to a national system.

The Bar Association has just performed an excellent piece of work in procuring the removal of Gumbleton, the County Clerk, by the Governor, on the charge of exacting unlawful fees, and refusing to exhibit on demand, as required by law, the books in which he is bound to record them. He really had no such books and received the demand for them with insolent defiance, and baffled his pursuers for several weeks by appealing against the mandamuses issued against him, and then obtaining a stay of proceedings pending the appeal. The prosecutors finally went to the Governor, who, after a full hearing, found him guilty and summarily removed him. He had not, in fact, the shadow of a defence, except that his abuses were of long standing, and he gave a touch of bouffe to the proceedings by telegraphing to the Governor at the last moment, requesting him to stay execution until the appeal before the courts could be heard. Loew, the Register, who was brought up on similar charges, escaped by confession, penitence, and promise of reform. Gumbleton's case was closed in a not uncommon New York fashion, by his successor taking forcible possession of the office at four o'clock in the morning, so as to compel Gumbleton to institute the legal proceedings which so often follow a dismissal from office.

The curious and diverting feature in the affair is that though Gumbleton had no defence, and his guilt was fully proved, the politicians all talk as if his guilt can have had nothing to do with it, and as if it must be "a Tilden move," or, in other words, an effort to secure patronage that will affect the nominating convention in Tilden's interest. The tradition that a public officer can be removed by a superior, either of his own party or the other, because he has failed in his duty, is becoming very faint in New York politics, so firmly imbedded in the political mind is the usage which makes an office a reward for party services rather than a trust for the public service, and so deep down in the administrative machinery does the preparation for the Presidential election go. The nomination is still a year and a half distant, and yet the preparations for it are heard even among the scrubbing women in the City Hall. The Mayor has called on the Police Commissioners to show cause why they should not be removed for neglect of duty, but the question oftenest asked is not, Are they guilty? but, Is this "a Tilden move," or what *kind* of "move" is it?—meaning what effect is it likely to have on the next Presidency.

The affairs of Barron, the cashier of the Dexter Savings-Bank, who has been accused of committing suicide to cover up a defalcation, have been thoroughly examined, and he has been pronounced guiltless of any wrong. The *Tribune* now says very properly "that the accusation was one that should not have been made lightly, for it attacked the memory of a dead man, and must have inflicted incalculable anguish on his family." This is very true, but you should have thought of it, esteemed contemporary, when, the day after the accusation was made, you gave it a column of leaded type, headed "A Thief, not a Hero." If the feelings of families are to receive consideration from journalists, they should receive it "first, last, and all the time," as the politicians say. The dread of "beats" on the part of journalists is the curse of American families, and indeed of every man in the community whom trouble of any kind threatens or overtakes.

A correspondent writes to us to say we were mistaken in calling St. Stephen's College, where the late students' row occurred, a "theological seminary"; that it is really a lay college, but that the majority of the students intend after taking their degree to study divinity; that those who went on the sleighing party and belonged to the minority, he thinks, do not intend to become "teachers of religion," but he admits that some of the intending divinity students did participate in the ensuing fight. As there are students intending to become ministers in all colleges in the country, he thinks it unfair therefore to say, as we said, that the St. Stephen's professors will not be able to prepare the fighting men for orders "within any reasonable period." We are willing to modify our expression so far as to say that the professors will have great difficulty in preparing the fighting men to graduate in a frame of mind that will make it proper for them to begin the study of divinity. We think a young man who fights with a chair is distinctly marked out by nature for a secular calling.

The feature of the week in Wall Street has been the advance in the rates for money. The call-loan rate a week ago was 3 to 4 per cent.; it is now fully 5 per cent. and the tendency is still upward. The banks have been depleted of legal-tender notes by the payments into the Treasury on account of 4 per cent. bonds, and the reserve in excess of the 25 per cent. required by law has fallen to $3,840,000, or to less than one-fourth of what it was a year ago. As this low reserve comes just at the beginning of the usual outflow of currency for the April settlements there is some uneasiness about the working of the money market, and the Secretary of the Treasury has thought it necessary to publish a letter assuring the public that he will exert the full power of the Treasury to prevent "tight money." Money in London is down to 2 per cent., and rates are unusually low at every European city. Sterling exchange was near to the gold-exporting point until late in the week, when on account of higher rates for money it fell off. Subscriptions to the 4 per cents continue on a moderate scale, but another $10,000,000 of 5.20 6 per cents have been notified for redemption, making $270,000,000 of the debt on which the annual interest has been reduced one-third since January 1. Silver has taken another tumble in London from 49⅝*d.* to 49⅛*d.* per oz., the latter being the lowest price since remonetization in this country. The bullion value of the 412½-grain silver dollar at the close of the week was $0.8295.

The new Canadian Administration redeemed its campaign pledges last week by "bringing down," as they say across the border, a revised tariff based on the principle of protective retaliation against the United States. The Finance Minister, Mr. Tilley, introduced his budget with a long speech explaining the difficulties of the situation which seemed to call for an abandonment of the policy of a revenue tariff. He described the effect of the abrogation of the Reciprocity Treaty in 1865 as making Canada the "slaughter market" of the United States; that is, an outlet for the sale of their surplus manufactures at any price below the cost of the Canadian production. Nevertheless, for twelve years, he said, American goods to a very great extent had been admitted free in the hope of inspiring a more liberal spirit in the American breast, and even now that a different course is to be pursued, the tariff will be coupled with a resolution providing for reciprocity as fast and as far as the United States may invite and concede it. In the meantime, Mr. Tilley proposes to take a larger amount of the $2,000,000 deficit he seeks to cover out of his disobliging neighbors than out of the mother country. He showed that while the imports for consumption from England had fallen off nearly one-half in the past four years, those from the United States had diminished only one-eighth, and that they were in 1877–78 (in round numbers) $37,000,000 and $48,000,000 respectively. Moreover, while the average percentage of duty on all Canadian imports is 13¾ per cent., last year the

amount collected on British goods was about 17½ per cent., and on American about 10.

As the decline in the revenue is attributable in part to the natural operation of an *ad-valorem* tariff on falling markets, the number of specific duties has been increased in the proposed tariff. To recover the lost West India trade in sugar, that imported direct will pay no duty upon packages and charges, and the duty on molasses for refining purposes will be reduced from 25 to 15 per cent. In fixing the differential line for sugar, No. 14 is selected, and there is a slight increase in the *ad-valorem* duty for grades above and below the standard. The tea trade is to be courted back by a 10 per cent. duty on teas coming from the United States. Wool is admitted free, and manufactured goods protected heavily, on the theory that the farmer who now has to sell to the States at a loss will find a better market at home. Similarly, cotton wool and waste enter free, and the goods are protected. The farmer is also favored by duties on wheat, coarse grains and flour, potatoes, tomatoes, and vegetables generally. Coal, in the interest of Nova Scotia, pays fifty cents a ton. Earthenware, carriages, furniture, sewing-machines, clocks, organs, agricultural implements, stoves, locomotives, are all more or less heavily protected. Cordage is taxed ten per cent.; but the duty is returned on this as on other dutiable articles entering into ship-building when the vessel is for export. The duty on books is rated by the pound, so that the post-office will have no such difficulty in determining it as ours now experiences under the *ad-valorem* system.

The impeachment of the Ministers of the 16th of May which was recommended by the report of the Brisson Committee has been badly beaten in the Assembly. M. Waddington made it a Cabinet question, in his speech in opposition to it, announcing that if it were carried the Ministry would resign. It was defeated by 317 to 159. It was immediately followed by another resolution declaring that the De Broglie Ministry and that of General Rochebouet which preceded it had, by their culpable schemes, betrayed the Government they were employed to serve, and were accordingly delivered over by the Chamber to the judgment of the nation, and ordering the resolution to be placarded in every Commune in France. This was carried by 240 to 154. The placarding is probably the thing that will sting the ex-Ministers most, as every Frenchman has a horror of being "posted," a feeling of which great use is made in French criminal jurisprudence, by compelling defendants to bear the cost of publishing and circulating, or placarding, the story of their own disgrace. The ex-Ministers are said to be preparing a protest. The Government got a majority of forty in the Moderate Left, but M. Waddington's speech was not satisfactory, and one phrase, in which he spoke of the present régime as an experiment, was very unlucky and gave great dissatisfaction.

The charge against M. Léon Say of having withheld from the public information about the conversion of the five per cents which he communicated to a syndicate of brokers, has been examined by a committee of the Assembly, and has not been sustained. He has accounted satisfactorily for every day of the delay by showing that at no moment before the announcement was actually made to the public was he in a position to make it or did he make it, and the Paris correspondent of the London *Times* alleges that it was first made known in Paris by his despatch to that paper being telegraphed back. The Cabinet has already had so much to bear that all who are interested in the success of the Republic must be glad that it has escaped the misfortune of seeing the character of a man of M. Léon Say's standing broken down. It is all the more gratifying because the Extreme Left, which has been most prominent in the attack on the Ministers, has apparently passed under the leadership of an able fanatic named Clemenceau, of the destructive school, who promises to give a good deal of trouble.

The English mind is still full of the Zulu disaster, which has now been as fully described as it can ever be, Lord Chelmsford's despatches having reached England; but it remains as great a mystery as ever how so large a force got round his flank without being observed. He was himself on the point of riding into it with his escort when he met another officer running away from it, and thus escaped, but very narrowly, sharing in the massacre. It is quite certain, however, that "somebody blundered" in the management of the troops that were slaughtered; that he was at first deceived and then surrounded. The losses of the Zulus have been enormous, which probably accounts for their subsequent inactivity. The inadequacy of the military establishment to the needs of the "imperial policy" has been strikingly illustrated by the fact that, though only three infantry regiments have been called for by Lord Chelmsford and two of cavalry, not one was ready for active service, and each had to be filled up to its fighting complement by drafts from other regiments, who will thus take the field without any knowledge of their officers.

Lord Dufferin has been sent as ambassador to St. Petersburg, and excused himself in his usual graceful fashion, at a dinner given him by the Liberals at the Reform Club, for taking service under a Tory Government by saying that he held diplomacy to be, like the army and navy, outside the sphere of party politics. He goes out to urge upon Russia with gentle firmness the propriety of getting her protégés in Eastern Rumelia and Bulgaria to carry out the Treaty of Berlin in a peaceable and orderly manner. The fact is that the Eastern Rumelians are determined not to submit to Turkish rule in any form, or to have the Balkan Passes garrisoned by Turkish troops, if they can help it, and they are encouraged naturally in their resistance by the meeting of the Bulgarian Parliament at Tirnova, inasmuch as this body seems to be fully as much occupied with their fate as with the affairs of its own province. Some of the English papers keep exhorting Lord Beaconsfield to give up Eastern Rumelia; but this is asking a little too much, because this he considered the great stroke of his Berlin mission. Nevertheless there are rumors that he is beginning to think of doing it, provided he can get something from Russia in return that will help to cover his retreat.

A correspondent gives elsewhere a curious account of the *émeute* of the dismissed army officers at Cairo. At the bottom of the trouble is the fact that the Khedive has promised so much to his creditors that he has little or nothing left for the ordinary expenses of the state. After England bought the Suez Canal shares she sent Mr. Cave to investigate his affairs and report on them, and the Khedive then asked the English Government to send some one out capable of putting them in order. They sent Mr. Rivers Wilson, who, on looking into them, declined the job. The bondholders then sent Messrs. Göschen and Joubert, who made a very cheering report. But it soon appeared that the Egyptian officials had deceived them, and the Khedive's private creditors began to sue him in the new courts, and in suing him attacked the public revenues, because all Government property was, in the eye of the Egyptian law, the Khedive's private property. Then the creditors became greatly alarmed, and France and England, under their pressure, made him pay the coupon next due; but to do it he had to neglect all the public works, including the Nile canals. Then there was another investigation, this time by Mr. Rivers Wilson, and the Khedive made over his private property to the state in return for a large salary, and set up a constitutional ministry under Nubar Pasha. Mr. Rivers Wilson, representing England, and M. de Blignières, representing France, were put in charge of the finances. But the total revenue of Egypt is only $41,000,000, and after paying the charges imposed by the public debt there only remains for the army and all other public expenses $7,500,000. One result of this state of things was the reduction of the army and the consequent *émeute* which our correspondent describes, in which Mr. Wilson and Nubar Pasha received corporal chastisement. Then Nubar Pasha was dismissed, and now England and France have forced the Khedive to take him back again.

THIRD-TERM PLAN.

THE Democrats took possession on Tuesday last, after eighteen years of opposition, of the legislative branch of the Government. Their majority in the House is not as large as it was in the last Congress, but it has appeared plainly from the vote cast in the caucus on the nomination of the Speaker that it is a working majority even without the aid of the Greenbackers. This result has been brought about, too, in spite of the most unfortunate history that any political party ever had. The Democratic party has been associated with the defence of an odious institution which was condemned before it fell by the moral sense of the civilized world, and which since its fall no one has ventured to regret. During the civil war the party was covertly or openly in sympathy with the public enemy, and would at any time have acquiesced in or have been pleased by his success. During these eighteen years, too, it has distinguished itself by attacks on the public credit, and on nearly all the conservative forces of society. It has been discredited by the most monstrous frauds committed by prominent members in places which they had reached through its votes. It has appealed to the basest passions of the basest portion of the community. It has steadily resisted everywhere even the mildest legislative attempts to prevent cheating at elections. No registry law has ever been loose enough or ineffective enough to satisfy it. It has completely abandoned, too, the sound and conservative position on monetary questions which constituted its chief merit in the early days of its history, and become the ready advocate, not simply of a certain wild financial idea, but of any financial idea that was wild. A Democratic platform has rarely been drawn since 1865 which did not contain a new theory about money, that ignored the facts of history and the principles of human nature. In fact, no party has ever more effectively earned the title of dangerous.

But in spite of this unfortunate history, in spite of its follies, its excesses, and the incapacity of its leaders, it has, during the last ten years, been steadily recovering its old place in the Government. In 1868, three years after the war, when General Grant entered on the Presidency, there were 63 Republicans in the Senate, and only 9 Democrats; there were 170 Republicans in the House, and only 66 Democrats. These proportions continued to change steadily during the ensuing eight years, until, when General Grant went out of office, the House contained 107 Republicans and 184 Democrats, and the Senate 46 Republicans and 29 Democrats. Now the Democrats have a majority in both branches; but the change was most significant in the lower House, which is renewed most frequently, and therefore most faithfully reflects popular sentiment. Nor was it due to the entrance of the South on the scene. Mr. J. W. Forney recently furnished a little table to the New York *Tribune*, which was most instructive as showing how the tide ran against the Republican party in the Northern States during the eight years of General Grant's Administration. Here it is:

REPRESENTATIVES.

	1868 to 1870.		1874 to 1876.	
	Rep.	Dem.	Rep.	Dem.
Indiana	8	3	5	8
Illinois	11	3	6	13
Massachusetts	10	0	6	5
Michigan	6	0	6	3
New Jersey	3	2	2	5
New York	20	11	16	17
Ohio	17	2	7	13
Pennsylvania	18	6	10	17
	93	27	58	81

It certainly was not the good government of the Democrats which effected this remarkable transformation. They were not in possession of the general Government, and their administration of such State governments as they happened to control was not very creditable. What did effect it was the manner in which the general Government was carried on by General Grant and a small body of counsellors who came to be known as the "Senatorial Group." As regards foreign affairs, in which this Camarilla took no interest, his Administration was very respectable; the scandals and abuses which marked the administration of the internal affairs of the country, and more particularly the Treasury, the Interior, and the War and Navy Departments, were simply shocking, and roused the indignation and disgust of the country, in spite of the strong and well-founded regard for General Grant as the successful soldier of the war. This indignation and disgust, too, were aggravated by the morals and manners of the class of persons with whom General Grant surrounded himself as his companions and confidants, and whose complicity in frauds on the Government was gradually brought to light. It was the spectacle of these things, combined with the support given by the Republican chiefs to the carpet-bag régime at the South, which gradually broke down the Republican majorities, sent tens of thousands into the Democratic camp odious as it was, and originated among others the determination to accomplish "reform within the party" which found such remarkable expression in the Cincinnati platform. That it found expression in the nomination of Mr. Hayes, we deny. The men who nominated Mr. Hayes did so in the belief that he would serve their purpose well enough, without offending the reformers. He has disappointed both them and the reformers by refusing either to do evil in the old way or do good in the new way. He was not given the nomination with any expectation that he would improve on General Grant's methods. In so far as he has attempted to do so he has been bitterly opposed.

Now, what is the remedy which a large body of excellent Republicans propose for what they consider the great evil and danger of a Democratic majority in both branches of Congress? How do they mean to escape from the present distressing situation? We are serious when we say that they propose the toper's cure for his headache—"a little of the hair of the dog that bit him." In other words, in order to recover the Republican supremacy which General Grant found so overwhelming, but which had disappeared under eight years of his rule, they propose to give him another term of four years. They say, "We cannot stand this sort of thing any longer" (*i. e.*, the spectacle of Democratic government); so they are going to vote for the man once more whose faults and indiscretions have bought it about. We do not intend to try to analyze the state of mind which makes this plan seem attractive, nor is it necessary to gainsay all that is put forward by way of commendation of General Grant as a man or as a soldier. We are here only concerned with the probable effect of a third term of General Grant on the Republican party; of this we must judge by the history of his last two terms, and judging by it we are driven to the following conclusions:

1. That the effect of foreign travel on a man of his age and stolidity and general mental equipment has probably been hardening rather than opening—that is, that it has probably strengthened his respect for money and his confidence in his own judgment, and that he will come back substantially unchanged, but, if changed at all, a less valuable civil administrator than he was.

2. That he will find all his old friends and advisers who are still living waiting for him eagerly in Washington, many of them restored to the positions which they had lost before he went away, and prepared with arguments drawn from Mr. Hayes's failure, and the revival of his own popularity, to show that the kind of government he carried on was after all the best one, and the one the people demanded, and that those who objected to it were dreamers and calumniators.

3. That he will thereupon commit himself anew to their hands with increased confidence and with tenfold greater insensibility to criticism than he formerly displayed, and that their audacity in jobbery and corruption will be in the direct ratio of this insensibility.

4. That the state of things which will then follow will be in many respects worse than that which revolted the public from 1870 to 1876, inasmuch as it will be marked by greater contempt for hostile opinion, and that the public—whose memory, as we see, is very short—will forget the shortcomings of the Democrats as readily as it is now forgetting those of the Grantites, and will express its indignation once more by increased Democratic majorities, until in

1884 the Republican party will be reduced to a worse plight than ever, and hopelessly excluded from power.

There could hardly, in fact, be a worse sign for the future of the party than that in its twenty-seventh year, after eighteen years of such power as no party has ever had, it should be so barren in men, should have done so little to bring talent and character to the front, that it should not be able to produce a single civilian to save it from the necessity of giving a third term to a soldier whose want of civil capacity had already deprived it of the control of the Government.

THE NEW YORK LEGAL-TENDER LAW.

A LAW of this State, passed March 22, 1875, provides that all taxes levied within the State, including of course municipal taxes, shall be collected in gold. The State debt was made payable in gold by a previous act, and all the later issues of New York city bonds were specifically made payable in the same kind of money. Another section of the Act of March 22, 1875, provides that all contracts payable within the State shall be payable in "United States *coin* of the standard of weight and fineness established by the laws of the United States at the time the contract or obligation shall have been made or implied." The reason of this act was that the State of New York desired to express her faith in and co-operation with the Specie Resumption Law of Congress, which had been passed two months earlier, and to contribute as much influence as she possessed to the realization of that then doubtful endeavor. Silver dollars had been demonetized by law two years before, and having been demonetized in fact more than forty years, nobody took any other kind of coin than gold coin into consideration. But since fractional parts of a dollar could not be paid in gold the word "coin" was used instead of the words "gold coin" in the section referring to private contracts and obligations.

Last week the Legislature repealed that portion of the law which requires taxes to be paid in gold, and left the remainder of the law unaltered. If the Governor signs the repealing bill, or if it is passed over his veto, all obligations within the State which are not made specifically payable in gold will be payable in silver, State and municipal taxes included. But inasmuch as the State and municipal bonds and interest are for the most part payable in gold the public authorities are liable soon to be confronted with the problem how to convert the one metal into the other, so as to make the revenue balance the expenditures. The further difficulty may shortly be presented to them of providing places of storage for silver, the banks having refused *en masse* to receive it on deposit, except under special contracts to be returned in kind, and some of the leading ones having decided not to receive it at all. It is true that the United States Treasury is obliged to receive it and give silver certificates for it, but silver certificates are not legal tender for anything except United States dues. The State and city treasurers may carry their silver, whenever it begins to come in in embarrassing quantities, to the Sub-Treasury and get it into the form of certificates, and sell these to brokers or importers for gold or its equivalent, with which to meet their own obligations. This roundabout and costly process may not come in play immediately, but the folly of throwing away the particular kind of money with which one's debts must be paid, and taking the chance of getting it back again by hook or crook, can hardly be characterized in fitting terms. It is by no means certain that other States will receive silver for taxes, none of them being obliged to do so. The Supreme Court held in the Oregon case (7 Wallace 71) that the legal-tender laws of the United States have no reference to taxes imposed by State authority. It is quite certain that some States will not receive silver for taxes, especially if a convenient outlet is furnished to them by the Legislature of New York for any superfluous silver that may drift into their respective jurisdictions, so that it is only necessary for their citizens to send it in the way of barter to the taxpayers of the Empire State. That the public treasuries which receive silver at par will be the ultimate receptacles of whatever is afloat is altogether certain. Nobody wants the trouble of handling it even though it be at par with gold. In France it accumulates in the vaults of the Bank despite very urgent measures adopted to force it into circulation, and in Austria the same popular repugnance to it is manifested. The Austro-Hungarian Bank has been so pestered with it by depositors that it discharged £200,000, or about thirty tons weight, upon the Imperial Treasury in a single payment a few weeks ago, which led the London *Economist* to remark that whatever be the legal-tender laws of civilized countries, their people will have as little to do with silver as possible.

Those who fancy that the New York and Boston banks will recede from the position they have taken regarding silver deposits, or that the banks throughout the country will adopt any different policy, will do well to make a note of the prevailing and almost universal desire to get rid of it, to avoid taking it, and to pass it off as soon as possible. This inclination possesses the advocates of the Silver Bill as much as other people. Those who have any silver dollars pay them out in preference to any other kind of money, and they are extremely anxious that the banks shall take them in order that they themselves may have some place not merely to deposit them but to get wholly rid of them. When asked to sign an agreement to take them back again they say that the banks are making a discrimination against silver, whereas *they* make a discrimination by refusing to sign. Their real position is that everybody has the right to discriminate against silver except the banks. Some Western and Southern banks, yielding to what they conceive to be the public sentiment of their neighborhoods, have already become inconveniently loaded with it. A Kentucky bank recently offered to lend silver without interest to a railroad company to be used in paying off its hands, the loan to be repaid at maturity in greenbacks, national-bank notes, or gold. The proffered loan was declined. The bank had taken silver on deposit, and the holders of checks against the bank had made objections to receiving it. Although they might have been compelled to take it by law, the bank could not afford to provoke a quarrel by forcing it on them. It could more easily incur a loss by lending it without interest, or by selling it at a discount. The stakeholders of the great walking match at Gilmore's Garden seem to have had a clear conception of the financial situation. According to the *Herald's* report they took in a large amount of silver for admissions, but each day they sent it to Wall Street and sold it for current funds, which they deposited in bank.

How long the silver mountain in the Treasury can continue to grow without crowding everything else out, is a question not easy to answer. Very much depends upon the balance kept between the public revenue and the public expenditures, and upon the views entertained by the Secretary of the Treasury for the time being. Mr. Sherman has announced that he holds himself at liberty to sell bonds to make good any inroad upon the fund held for resumption purposes, whether that inroad be caused by excessive appropriations like the Arrears of Pensions Bill, or by diminution of revenue like the reduction of the tobacco tax, or by any other eventuality. The wording of the Specie Resumption Act clearly gives him that authority, since it requires him not only to begin resumption but to maintain it, and puts the national resources, including the power to sell bonds, in his hands equally for both purposes. But he can disgorge his silver upon the community before selling any new bonds, if he chooses to do so, and the more extreme silver-men are already insisting that he shall. Some of them insist that he shall pay the arrears of pensions with silver dollars—in other words, that he shall discriminate against invalid soldiers. Meanwhile the price of silver has fallen in London below the "dead line" of 49½*d.* per ounce, about which it has hung so long, and the Indian Government, which has been struggling for some years with the problem how to pay gold debts with the proceeds of silver taxes—the same problem which the New York Legislature is now voluntarily taking upon itself—has announced its intention of negotiating a new gold loan, presumably to gain a breathing-spell against a further depreciation of the rupee.

These facts may have no effect upon the American Congress, but

they ought to make some impression upon men of business. That debts contracted now upon a gold basis may be paid in silver, and are liable to be so paid at the bullion value of that metal in the absence of a specific contract for payment in gold, and that a crisis of this sort may be precipitated suddenly by any one of a variety of accidents or personal whims on the part of the Secretary of the Treasury or a majority in Congress, is plain enough for the comprehension of anybody who has had the prudence to lay up a dollar against a rainy day. Nevertheless a profound lethargy and torpor has pervaded all classes, from the life-insurance and bank president down to the humblest savings depositor, each and all of whom are lending gold and agreeing to take silver in payment at any depreciation, however great, and the Legislature of New York is deliberately altering a wise law in order to put itself in a favorable attitude to incur similar losses. The risks which people take in this way are wholly needless. There is no law to prevent men from making contracts in such money as they prefer. The courts stand ready to enforce contracts in gold, silver, tin, coon-skins, or wampum. Nobody can complain of the injustice of a legal-tender law as regards contracts made or obligations incurred *after* its passage. It is desirable that the law shall construe a contract payable in dollars as meaning gold dollars unless a different kind of money is specified; but in the absence of such a law the struggling mechanic who puts a portion of his earnings in a savings-bank or a policy of life insurance, and the capitalist who lends this same money on bond and mortgage, are alike free to stipulate for repayment in as good funds as they part with. In all such affairs the poorer and weaker are entitled to look to the wealthy and educated for a right example, which we regret to observe has not yet been set before them, while the Legislature of New York has done its utmost to lead them astray.

PULPIT BOUFFE.

THE proposed trial—perhaps we should say the pending trial—of Mr. Talmage, of Brooklyn, for untruthfulness and charlatanry, is an attempt of the Church to deal with a growing evil, namely, the tendency to make church-going attractive by a bouffe treatment of religious subjects in the pulpit. It is not likely to succeed, because to put down a bouffe preacher he must be attacked in the very beginning of his career, and none of the existing organizations of the Protestant Church ever prosecute a minister at all if they can possibly avoid it, or prosecute him one minute sooner than they can help. All ministers naturally recoil from the task of holding up a brother minister to public odium, and most church-members naturally dislike making a church scandal, if for no other reason, on account of the discredit it is likely to bring on religion itself. Then, bouffe treatment, too, is a thing difficult of definition. In its earlier stages the line which separates it from merely picturesque or warm treatment may be very faint. No preacher becomes markedly bouffe all of a sudden. Consequently he may go on for years grieving the judicious and making the worldlings laugh before there is anything positive enough in his performances to warrant an ecclesiastical court in laying hold of him. By the time it does make up its mind to call him to account he has, by the ordinary process of selection, collected a congregation who like him for his defects, and are prepared to stand by him, come what may, and who, in fact, would not "sit under him" if he were not guilty of the very offences with which he is charged. Under these circumstances he is, of course, prepared to defy the constituted authorities, and indeed comes into court not to plead but to rebuke them for annoying him, knowing well that their verdict will not be and cannot be followed by any penalty which he will heed. The trial, therefore, is apt to be a farce, in which the culprit plays the leading and popular part, and by which the church organization is made ridiculous.

The bouffe tendency is one result of the change in the minister's position wrought by the decay of popular interest in doctrinal theology. When the minister was the trained and duly commissioned exponent of what was accepted as a science, the conclusions of which every man felt bound to ascertain from authorized sources, the poorest preacher could rely with more or less confidence on his subject to secure him a hearing. Those who refused or failed to hear him because he was dull, felt that they did so at their peril. He was really in the position of a physician charged with the cure of souls, and his knowledge was his main qualification, his manner of communicating it a minor consideration. With the decline of interest in dogmas and the growth of doubt about all the principal points of the Christian creed, the minister has become more of a lecturer on morality, and less of an expounder of the law. In other words, he speaks with less authority than he used to speak, and has to rely more than formerly on his natural gifts. This change in his position has been strikingly illustrated by the history of the practice or weakness of sleeping in church. This is distinctly a Protestant weakness. It was unknown before the Reformation, and is unknown now in the Catholic Church, where the frequent changes of posture, and the duty of praying himself instead of following the priest, keeps the worshipper's attention aroused. Drowsiness made its appearance in the Protestant Church as the accompaniment of long extemporaneous sermons and prayers, which imposed upon the worshipper the simple duty of listening in one position, and at the same time exposed him to that most soporific of all influences—the sound of a steady flow of words the sense of which does not excite eager attention. The result was that the difficulty of keeping awake in church was for two centuries among Protestants one of the serious questions of a religious life, and all sorts of artificial contrivances were resorted to to combat it, such as standing up, and the application of titillating substances to the mucous membrane, like fennel seed or "meetin' seeds," lemon-peel, and calamus or "sweet-flag," and at a later period pepper lozenges. It furnished, too, the material for a very large proportion of the ecclesiastical facetiæ of the eighteenth and the earlier part of the present century. What was remarkable about it then, however, was that the blame of it was not thrown on the preacher. It was considered the hearer's duty to stay awake, not the preacher's duty to keep him awake. A minister was not liable to be dismissed for not rousing the attention of the somnolent, and people kept up without faltering their attendance at a church where they knew that as soon as the sermon began sleep would come upon them as a strong man armed. Under these circumstances there was little temptation to pulpit extravagances or oddities of any kind, or to anything like what may be called inflammatory treatment of sacred subjects. The idea that the Gospel could be made an amusing theme never entered any one's head. A minister's main concern was to avoid flaws in his theology and defects of logic in his argument, and sermons had a good many of the characteristics of the oratory listened to by judges sitting *in banco*.

In our time, however, a great change has come over the churchgoer's spirit. He has thrown away his "meetin' seed" and pepper lozenges, and has imposed on the preacher the task of keeping him awake. If he finds himself sleepy in church, he either goes off to another or gets up an agitation for the pastor's dismissal on the ground that he "doesn't interest the young people," or stays at home altogether. He unconsciously compares him with the popular lecturer on slavery, or on temperance, or on the Holy Land, who has within the last forty years made a practice of visiting him every winter. If he lives in the city, he compares him with his neighbor's pastor, who has filled all the pews at high rates and set the trustees to talking of building further up-town. The consequence is that the pressure on the clergy for popularity of method among us is, at this moment, such as has never been known in any other age or nation. It has converted the churches into competing lyceums, or places of entertainment, and the competition is not confined to particular groups or denominations. Every church, no matter of what denomination, competes with every church of every other denomination, because denominational ties now sit so lightly that a Presbyterian has little difficulty in becoming an Episcopalian, Methodist, or Baptist, in order to get the benefit of a more attractive service; and the Episcopalian, Methodist, or Baptist, in his turn, is equally facile. It is but just to the congregations to say that they are very ready to help the minister out in the struggle with costly architecture and music and other external attractions. In fact, nothing is left undone to make the church a place where people shall not only find it easy to stay awake, but shall be enlivened and entertained, and have their sensibilities touched by the most efficacious methods.

Of course this pressure operates very differently in different cases. It has probably made a good deal of change in all preaching. It has made doctrinal sermons, properly so called, very rare, and in fact made nearly all pulpit oratory didactic rather than exegetical. The pulpit's prevailing themes are the duties and temptations of every-day life. It devotes itself mainly now, as has been said, to touching morality with the fire of emotion. It discusses politics a good deal under the

name of "questions of the day." It has always done so, perhaps a good deal more so formerly than now, but with this difference, that the old preacher discussed politics distinctly as a theologian from the point of view of authority, and judged men and measures *a priori* by the aid of Scriptural texts. The modern minister, on the other hand, does not hesitate to meet the utilitarian statesmen on their own ground, and to dispute with them over their own tests and standards, and to put temporal happiness in the foreground as the reward of wise legislation. The amount of preaching of this kind one can hear nowadays is very great. In fact, the most spiritually-minded ministers feel the absolute necessity of supplying a certain amount of it through the year, both as something the congregation looks for, and as part of their own mission. The Rev. Joseph Cooke's "prelude" or preliminary remarks on current events with which he prefaces his lectures on religious themes, is a curious recognition of the popular requirements on this point. The "prelude" is evidently intended to put the audience in good humor preparatory to the dryer and more exacting matter which is to follow, and recalls, if one may say so without disrespect, the chromo by which the editor of the religious newspaper induces the new subscriber to listen to him for one year on the solemn themes of life and death and judgment. Other regular ministers have resorted to the same expedient, and treat their congregation to a few minutes of "secular matter" before beginning the ordinary religious exercises of the day.

But the rôle of a didactic moralist is a very trying one. It is not every man, no matter what his parts or training, who can fill it even moderately well. The rules of right living are few and simple, and are well known. Nothing has been added to them in eighteen hundred years, and the world, in these days of endless iteration, has almost grown weary of them. But the application of them has been rendered increasingly difficult by the immense complexity of modern life, by the wondrous tangle of conflicting rights, and opposing duties, and delicately divided interests which constitutes what we call civilized society. To lead even the humblest and simplest through it in safety is a task for which hardly any training but that of an experience of life such as but very few men can boast, will prepare one. Nothing requires a higher order of talent and a more varied acquaintance with trials and temptations, than to make a sermon on the conduct of life strike an average business or professional man in our day "right on the top of the head," as we once heard a car-driver describe the way one of Moody's discourses affected him. No college course and no amount of reading can make up to the average preacher for not having seen and suffered much. Nothing can make up for it but genius, for genius has travelled in all lands and lived in all ages, has wept beside the graves of a household and charged in the forlorn hope in the raw dawn of the winter's morning. But then genius is rare, and the coarse-fibred and ill-equipped man, when he seeks the means of keeping his congregation awake, and paying the church debt and the salaries of the choir, not unnaturally falls into the humorous and grotesque vein, which is almost always successful if pursued with a certain moderation at the outset. Talmage, for instance, makes no attempt to conceal the fact that bouffe is his specialty. He defended himself, one Sunday not long ago, against the charge of unseemly levity by showing that while other churches were, as he said, "the great dormitories of civilization," in his church nobody ever slept a wink. In fact he keeps the congregation in a roar or with a twinkle in their eye during the whole service. It is not very long since his invitation—"Let us sing a hymn"—brought out a shout of laughter, just as it would have done at the Comic Opera, owing to the queer collocation in which he produced it. And yet no one can listen to his discourses or examine his mode of stimulating the religious sense without seeing that there is nothing new in his style; that what he has done is simply to go a little further than some others of his popular brethren, who also have been eminently successful in keeping their people awake.

The main ingredient of pulpit bouffe is, however, essentially the same as that of opéra bouffe. It consists in the irreverent treatment of things which people have been in the habit of looking on with reverence. In the first stage of this the shock is too great for laughter; but when people have become a little used to it, it supplies a kind of fun which they relish enormously, especially if they have been strictly brought up. In the opéra bouffe the humor lies in a kind of reversal of the moral order of society. A cowardly colonel who runs away in the field is at once promoted and decorated. A defaulting banker is made State treasurer. The king's privy councillors, grave and elderly men, go out of the royal presence dancing a jig. In the pulpit in like manner there are two essential features in the bouffe method. The first is the presentation of the Deity as governing the universe justly, but still, on the humorous plan—that is, convicting the sinner by getting the better of him—or in other words, being too smart for him. In fact, the sinner usually appears in the sermons of the School as a person who suffers for his simplicity, and generally cuts a ludicrous figure when his wickedness is brought to light. The second is an appeal to the risibility which always lies concealed in decayed reverence. When there has been a distinct decline in a man's capacity for awe, his sense of the comical is always touched by seeing the old objects of his worship treated with a good-humored disrespect and familiarity. People who have received a religious education, but who have fallen away from their early teaching, are therefore apt to be much tickled by a slightly comic handling of what they once held sacred. The sweetness of laughter on solemn occasions and in forbidden places is known to everybody, but it is hardly any sweeter, though usually more open, than the laughter of the irreverent religious man at the attempts of his pastor to make the Gospel entertaining to him and present the wicked in the light of greenhorns. The fatal defect in the plan is that to keep it effective a steady broadening of the humor is necessary. The jokes have to become day by day more palpable and the colors to be laid on more deeply as the congregation's sense of decorum declines, and its appetite for amusement grows dull. The result is that a preacher of the Talmage school is condemned by the law of his method to continued progress towards the extreme. If he once begins to make points in order to send a smile round the pews, he cannot stop till his flock begins to watch for jokes in his prayers or greets him now and then in his sermon with the regular theatrical roar. It is desirable, for the sake not of religion only but of all the virtues on which society rests, that such preachers should have no organizations outside their own churches to be responsible for them. For if there be anything certain in the lessons of history it is that no community was ever long capable of great things in which the serious element in character has been successfully attacked and either destroyed or enfeebled.

THE REASSEMBLING OF PARLIAMENT.

London, March 4, 1879.

PARLIAMENT met again three weeks ago, but I have not written before to call attention to the fact because I was waiting for something to happen which would justify such a proceeding. Up to the present moment I have waited in vain, and I must now content myself with remarking that the session is characterized by extreme vacuity. The course of legislation is dull, and there is nothing exciting in prospect. It seems probable that the remainder of the session will be very humdrum, and that its interest will have been exhausted in those lively debates upon the Afghan war (if lively is the word) which took place before the recess. There was no second Queen's speech, as it had been thought possible there might be, and the national legislators have settled down to the discussion of domestic measures more or less substantial indeed, but not calculated to renew the strife of parties or to agitate the public mind. The Opposition, for the moment, is not aggressive, and the Government is not jubilant. There is just now no particular reason for jubilation, and whatever excitement exists in the country is outside of Parliament. It carries the minds of Englishmen very far from the Westminster shore to that remote South African territory, of its connection with which the country has never before had so acute a consciousness. This consciousness has become, all of a sudden, terribly painful, and we have got some time to wait before it can be transmuted into something brighter. Even then, too, the brightness will be questionable, for it will simply mean that a large number more of young English lives have been expended in castigating a multitude of brutal savages. You will long since have heard all the details of the military disaster in South Africa, and have learned that the public suspense, since it occurred, has been greater than on any occasion since the first news of the Indian mutiny reached England twenty-two years ago. Telegraphic communication with Natal is only partial, thanks to the economical principles of successive governments ambitious of achieving the remarkable feat of reconciling the possession of great and distant dependencies with comfortable ideas of cheapness. After the almost complete destruction of the Twenty-fourth Regiment at Isandula, and the momentary paralyzation of Sir Bartle Frere's aggressive movement, it seemed very likely that the whole colony of Natal lay at the mercy of the victorious Zulus. There was no means of knowing in what degree the Zulus had followed up their victory, so that for many days after the news of the massacre of Lord Chelmsford's troops arrived the anxiety was of the most painful sort. Little by little

it has abated, and as successive mails have shown that Cetewayo, in spite of his horrible triumph and of the panic he had produced at Natal, was still holding off, there is every reason to hope that he will not have followed up his advantage before the arrival of the reinforcements which, with all the speed that has been found possible, are now embarking for the Cape. It is assumed without unwarrantable fatuity that the six regiments now despatched from England will promptly turn the tables upon the Zulus.

It cannot be said, however, that there is any great comfort in this assumption, or that the outlook in this and in several other directions is particularly gratifying. People are glad to be able to feel that a tragic accident like the hopeless resistance at Isandula and the defence at Rorke's Drift serves at least to remind them of the solid quality of English courage. There has been, inevitably, a considerable flourish of journalistic trumpets over this exhibition. One would almost have thought at moments that it had been supposed that the great tradition of British bravery had got mislaid. In fact, it is evidently in excellent keeping. The British soldier, as one observes him in the streets of garrison towns, is apt to seem rather slim and juvenile; but if his resolution in putting the best face upon imminent slaughter by an overwhelming force of bloodthirsty savages be taken as a measure, his fighting qualities in the gross are still such as a great nation may count upon. No one, however, has ever seriously doubted the capacity of contemporary Englishmen, in case of absolute necessity, for drinking, as Tennyson says, delight of battle. But the country is averse to fighting, and it has formed the habit—an eminently proper one—of looking very hard at the occasion or the provocation before enjoying itself. Exercising at the present moment this scrutinizing faculty, it is by no means gratified by what it perceives. Sir Bartle Frere has all the appearance of having undertaken a Zulu war upon his own responsibility, and as the affair has opened with a deplorable catastrophe, it is obvious that he will not be let off so easily as if he had made a more impressive beginning. At the time I write Sir Charles Dilke is moving in the House of Commons a vote of censure upon the whole business. It remains to be seen with what cordiality the motion will be taken up by the Opposition. I think I may say, without speaking cynically, that the Liberals will lack the incentive of feeling, in this case, that they shall embarrass the Government. The case is a very different one from that of the Afghan war, which afforded a much more convenient handle for making out a grievance. This is not a Governmental war. The Cabinet has already done a great deal towards washing its hands of Sir Bartle Frere's performances, and it is not impossible that it may completely cleanse them by sacrificing him altogether upon the altar of popular indignation. If it does so, however, I cannot help thinking that it will pay to this irritated divinity a tribute unduly large. It may be thought that nothing less will serve to propitiate the public conscience, for the Cabinet is slightly compromised in the matter by the fact that only six months since it went altogether with Sir Bartle Frere in his showing cause why the Afghan war was an eminently desirable enterprise. It was upon the demonstration drawn up by Sir Bartle that the Government avowedly took its stand. He has apparently a weakness for colonial aggression—or, in politer terms, expansion—and a relish for conflict with dusky races. However this be, the Government had distinctly differed with him as regards the policy he was preparing to institute in his new governorship. He was eager for an anticipatory war; he was alarmed at the growth of the Zulu power and the facility with which the subjects of the corpulent Cetewayo appeared to assimilate European military notions. He wished to do what Prussia has the credit of having desired to do some five years since with regard to France—to fall upon his menacing neighbor and crush him before he should grow stronger. Sir Theophilus Shepstone had begun by annexing the Transvaal—it will be remembered that this little transaction took place, rather awkwardly, more than a year ago, at the moment that the outcry against the absorbent tendencies of Russia was at its height—and Sir Bartle Frere, appointed for the purpose of imparting an official gloss to a rather rough proceeding, appears to have found no better way of regularizing, as the French say, the situation than to take up the quarrel of the Dutch settlers, whose policy with regard to the natives had made hostilities chronic.

It may have been that he has behaved very improperly, and in the happy consciousness of immunity from telegraphic control has snapped his fingers at the home Government. As I said just now, the tone that the Government has already taken in Parliament points to this; but I cannot help repeating that even if he has been a trifle precipitate in taking for granted that hostilities were inevitable, there is a point of view from which it would not be especially inspiring to see him sacrificed. This point of view is perhaps a little too much that of the disinterested stranger, the irresponsible spectator of English public affairs; but it coincides with that of a certain type of British patriot quite closely enough to make it defensible. I am almost tempted to say that a friendly American, living in England, suspects himself at times of being a better Englishman, in the old-fashioned sense of the word, than a certain proportion of her Majesty's subjects. He is fortunate, at any rate, in this respect, that he is exempt from the obligation of party allegiance—he is at liberty to contemplate philosophically, among numbers of his friends and of the nation at large, the moral ravages of party passion. He is at liberty to say to himself, and to passive listeners across the sea, that it sometimes narrows down rather pitifully the proud consciousness of being an Englishman. The hatred of Lord Beaconsfield and all his ways and works has a regrettable as well as an estimable side. It is, very properly, displeasing to many honorable minds to see a charlatan of genius at the head of affairs—a gentleman who irresistibly suggests the performer at a circus, in the spangled *caleçon*, turning somersaults upon a piebald courser and leering mechanically at the spectators. It is certainly disagreeable that the British nation should be assimilated to a piebald courser. But Lord Beaconsfield is an accident, and those idiosyncrasies of the British Empire which have given him his chance are, it is to be hoped, a permanence. These idiosyncrasies are an "imperial" spirit (the word is in dreadfully bad odor, but if we are free to use the substantive I don't see why we shouldn't use the adjective), a collection of great colonies and dependencies, an immense artificial cohesion, the need to keep things up, to spend money, the liability to fight. It can hardly fail to strike an American observer that the attitude of a great many very reasonable and sensible Englishmen with regard to these points is extremely illiberal. I hardly know what to call it without using invidious epithets; it is stingy, grudging, parsimonious. I have lived in various countries, but I have never heard so much about the "taxpayer" as since I have lived in this opulent and comfortable London. And I have heard about him in the most unexpected places; I have heard pathetic appeals made for him at luxurious firesides in South Kensington, in circumstances which seemed the last expression of the tendencies of a luxurious generation. I have been startled in the midst of five-o'clock tea by indignant allusions to the increase of a penny in the pound on the income-tax. There is scarcely a nation in the civilized world which of late years has not been obliged to enter more or less cheerfully upon a great national war, and to accommodate itself to the pecuniary burdens of the case. Have the English lost this useful faculty, and are they weaker in this respect than the French and the Germans, the Russians, the Italians, ourselves? Have they been corrupted by making themselves the most comfortable nation in the world, and their country the most convenient to live in—by their immense elaboration of the arts of peace, of leisure, of extracting large enjoyment from large incomes?

I am far from believing it or from saying it; and yet I cannot help saying that a good sympathetic American cannot help feeling a little alarmed at times, and wishing, in a friendly way, that the country might be thrown on its back, suddenly, for half an hour, by some incalculable accident, so that it might give a little play to unused muscles in the effort to sit upright again. It is a theory of a good many positive people who don't all go with the Opposition just now as an opposition, that the Liberal party had completely forgotten the existence of colonies, of foreign nations, of "imperial" responsibilities, and that its present ill-humor arises from having been too abruptly reminded of them. However this may be, it certainly appears to the perhaps rather vague-minded speculators with whom I here identify myself, that the British Empire is an immense artificial structure which can only be sustained by very handsome arrangements—by a large army, a large expenditure, and a considerable confidence in the powers, whoever they be for the time, administering colonial affairs. The British Empire is an heroic creation, and it seems to me there must be a grain of heroism in the usual management of it. It is on these general impressions—I will not do them the honor of calling them principles—that I should deprecate that sort of agitation of which the precipitate condemnation of Sir Bartle Frere would be an example. It may perfectly well be that in this case such a catastrophe is well merited. But none the less one might almost regret the encouragement it would give to a fashion of which it would be hard to foresee the outcome—the fashion of contesting and overhauling in detail, at home, every step taken by the Government abroad, of compelling it to account, on the instant, for every motion of its foreign policy

at the bar of the daily papers. It is impossible to eat one's cake and have it, and it is out of the question to administer the British Empire on what the *Pall Mall Gazette* is so fond of denouncing as "parochial" principles. If the English people establish their dominion in a land of bellicose savages, it is surely conceivable that hostile relations with such savages should be on the cards.

THE LATE EGYPTIAN ÉMEUTE.

CAIRO, Feb. 24, 1879.

ON the 9th of February, Nubar Pasha, the Egyptian Prime Minister, issued an order for upwards of two thousand army officers to be placed upon half pay, which in this country is nearly the same as being discharged altogether from the service. These officers, together with all other employés of the Ministries of War and Marine, had between fifteen and twenty-five months' arrears of pay due them. The order for retirement appeared without the slightest warning, and was accompanied by no intimation whatever as to the payment of even a portion of the arrears. After the lapse of a few days, however, these officers were told semi-officially that they could have *one month's* pay, but that they would probably have to wait some time before they got the rest.

The long-forbearing creditors of these officers, hearing this, naturally became uneasy. Credit came to an end, and at Kafr-el-Zyatt the families of officers were turned into the streets and shelter and food denied them. Men already in poverty and wretchedness were told that their misery was to be increased, and the result might easily have been foreseen. On February 18 about three hundred discharged officers went in a body to the Ministry of Finance. Five or six of them, as spokesmen for the rest, entered the Ministry, and in very respectful terms requested that their arrears be paid them. Nubar Pasha and Mr. Rivers Wilson, the Finance Minister, told them that they could make no promises. The officers demanded a more definite reply, and Nubar Pasha told them that he had no time to discuss the matter further, and ordered his carriage to drive away. The officers still insisted upon a reply to their demand. Nubar Pasha nevertheless got into his carriage and started off. His horses were, however, stopped at the gate of the court-yard of the Ministry, when the coachman struck an officer, a major of the staff and a professor at the Military Schools, with his whip. The coachman was immediately pulled from his seat and soundly flogged. Nubar Pasha himself was also dragged from the carriage and rather severely beaten, but sustained no serious injury. Mr. Rivers Wilson, who in his carriage had followed Nubar Pasha, raised his cane in a threatening manner. The cane was immediately struck from his hand by a sabre, and himself drawn by his beard from his carriage and severely *spanked* with the flat of several sabres. Neither of these gentlemen was seriously injured. They were merely told to go back and give a proper answer to the demand which had been addressed to them. Aly Pasha Mubarek, the Minister of Public Instruction, who happened to be present, was also roughly handled, but managed to run away, not without leaving behind him the skirts of his Stambuline coat.

The Khedive, who had been telegraphed for, now arrived and was received with cheers. He told the officers that he would make their cause his own, and that justice should be done them, but that it was now their duty to disperse. This order was obeyed by all but a few hot-headed ones, whom the Khedive's guard arrested. A few shots were exchanged during this part of the proceedings, but not more than half a dozen wounds were inflicted. While the Khedive was talking to the officers, Nubar Pasha and Mr. Rivers Wilson escaped from the Ministry by a side entrance. All army officers were consigned to their quarters for the night, and Nubar Pasha and Mr. Rivers Wilson probably owe their lives to the promptitude and tact of the Khedive. During the night there was a council of the Ministers, and Nubar Pasha accused Ratib Pasha, the War Minister, of having connived at the affair. Ratib Pasha replied :

"Fortunately for yourself and Mr. Rivers Wilson I had nothing to do with the matter ; because if I had arranged it, instead of having a handful of officers to deal with, you would have had battalions marching upon your Ministry with fixed bayonets, and neither of you gentlemen would have gotten away so easily."

Nubar Pasha gave in his resignation, which the Khedive at once accepted.

The feeling here—excepting, of course, among the numerous high-salaried "Jingo" protégés of Mr. Rivers Wilson, who is himself a protégé of Lord Beaconsfield—is decidedly against the Government for their persistence in refusing to pay these officers their monthly dues while the rather high rate of interest on the public debt was punctually paid, and while some of the highly-paid English and French functionaries had even received their money in advance. The injustice of refusing to pay the army and navy is the more apparent when we bear in mind that when the Khedive handed over the entire control of the country to Nubar Pasha and the English and French Ministers, it was decided that the payment of all employés, *except* those of the War and Marine Ministries, should take precedence of even the payment of the interest due on the coupons. The result was that the army and navy were left out in the cold, as it were ; while young Englishmen, lucky enough to command sufficient interest in London, were brought out here at unnecessarily large salaries, and have at times worked side by side with men possessing equal ability and greater experience in the country, but who had the ill-luck to be attached to the moderately and irregularly paid War Department.

This affair of the 18th inst. occurred when the religious feelings of the Mohammedans are most susceptible. It is during the month of February that the greatest number of pilgrims return from Mecca. The large caravan bearing the *mahmal*, or sacred carpet, which for the past year has covered the tomb of the prophet, was encamped in the environs of Cairo. The entry into the city of the procession bearing the carpet to the Mosque of Sultan Hassan, its final resting place, is one of the most important religious ceremonies. In view of the excited state of the people the Khedive postponed the entry of the pilgrims until to-day, when, due precautions having been taken, the ceremonies took place without the slightest disturbance, and everything will go on well unless there should be some indiscretion on the part of the English or French Ministers, Mr. Rivers Wilson and M. Blignières, the former of whom has caused a great deal of ill-feeling here by telegraphing to Lord Beaconsfield to ask whether the British Government would permit him to resign his position as an Egyptian Minister.

Correspondence.

THE DEMOCRATS AND THE SUPERVISION OF ELECTIONS.

TO THE EDITOR OF THE NATION :

SIR : In your editorial of the 6th inst., in reference to the late Congress, you assert without qualification that

"There is no honesty in accepting, as most Democrats profess to do, negro suffrage at the South as a lawful fact, and then professing to see no necessity for any extraordinary police measures for its protection. Everybody knows that negroes have and will have extraordinary difficulty in exercising their legal right, and that the State governments are not likely to protect them in it efficiently, and that it is a piece of self-stultification for Congress to repudiate all responsibility in the matter, at least so far as the enforcement of order at the polls at Federal elections goes. Any Democrat who denies all this ought in decency to advocate the disfranchisement of the negro."

Protest might well be entered by Democrats against this sweeping and *ex-cathedra* consignment to dishonesty and indecency, seeing that they have sacrificed so many of their traditional and inherited convictions in their effort to conform to the new order of things growing out of the war and the Constitutional Amendments ; but waiving this, as without profit, is there not wide room for difference of opinion as to the alleged facts from which you deduce your conclusions ? *Every one* does not *know* that negroes have and will have extraordinary difficulty in exercising the right of suffrage, and while it may suit Republican politicians to force this assumption upon those in the North who depend upon the press for their information, there are thousands of Republican as well as Democratic citizens who know that it cannot be sustained by proof. It is not denied that it was bitterly resisted when wielded in mass by corrupt and unprincipled carpet-baggers for their own emolument and the ruin of the States ; but it is plainly and unhesitatingly denied that such is now the case. In the State of Maryland, where in a number of the counties the negro vote is nearly as large as the white vote, the polls have always been absolutely free to all ; and even in the Gulf States, since they have been relieved of carpet-bag and military government, the negro vote has been in the main free and unobstructed. It is an element of power which the white race, itself divided politically, is already seeking to divide, and the State governments, therefore, may be reasonably expected to protect it efficiently. Democrats believe that police measures for the preservation of order at the polls at all elections belong to the several States and not to the Federal Government, and for this belief they cannot be *fairly* arraigned as dishonest or indecent. If the negro is ever to be made

a useful and harmonious factor in our political system, it can only be brought about by the voluntary political assimilation of the most intelligent and independent of the race with the wisest and kindliest of the whites; and while this result may be accomplished in a comparatively short period if the solution of the problem is left to the good sense and kindly relations of the parties, under existing Constitutional guarantees, it can never be the fruit of Congressional interference, which nine-tenths of the white people of the South feel to be unnecessary and offensive, and believe to be without Constitutional warrant.

It is much to be regretted that you should intimate your approval of the use of soldiers at the polls, since, whatever the differences between you and your Democratic readers, they have respected your political methods, and the broad and lofty views which you are accustomed to take of matters touching Constitutional right and the genius of republican government. History is too full of precedent to require any citation to establish the abhorrence of all English-speaking people for the presence of military forces at elections, and even the existing act of Congress on the subject expressly prohibits the use or presence of soldiers at elections "except to keep the peace at the polls." This act was passed by a Republican Congress in 1865, when the army of the United States was in occupation of all the Southern States; yet even then our traditions were such as to secure this safeguard against the presence of the army before the termination of the war which brought this army into the field. At that time there were no recognized State governments in the South, and the law referred to was designed for a protection against troops necessarily present by reason of the state of war. Now there is no pretence that any Southern State is unable to preserve order, and if such should be the case its legislature or executive can invoke the aid of the United States in accordance with the original Constitutional provision for this purpose. Yet it is sought to distort the restriction in the act mentioned into a sanction of the maintenance of troops at the polls upon the pretence of *apprehended* disturbance of the peace.

It would seem that your question, "What is the objection to supervisors of election chosen from both parties?" is substantially answered in your own words almost immediately following it—namely, "that the Federal Government always appears on the scene not as a peacemaker or arbiter, but as a fierce partisan eager for the triumph of one party"; but more fully the objections of Democrats are these:

1st. They do not believe that Congress possesses the power to appoint such supervisors, and they are unalterably opposed to the assumption of arbitrary power.

2d. It is notorious that such supervisors, though in terms appointed from both parties, really represent only the party in possession of the Federal Government. Those taken from this side are fierce partisans, while those nominally taken from the other side are either spies who have joined it for the purpose, or weak and inefficient men dictated by local Republican politicians because of their lack of nerve and character.

3d. They believe that the object of the law is to substitute these supervisors for the soldiers whose functions were terminated by the *posse comitatus* clause in the Appropriation Bill of last year, and thus to control the Presidential election in 1880.

4th. They are opposed on principle to any system which tends to beget a spirit of distrust and hatred between the States and the Federal Government, as this system must do, and which any party in power will inevitably seek to use for the perpetuation of its own power.

In all these objections they are honest, however mistaken they may be—your assertion to the contrary. They are prepared to continue a sincere submission to all the Constitutional Amendments, but they do not believe there is any present necessity for legislation in aid of these amendments, and they cannot accept as "appropriate legislation," within the Constitutional meaning of the term, all the political machinery which the Republicans have devised under this name.

Yours respectfully, JAMES A. PEARCE.

CHESTERTOWN, MD., March 8, 1879.

[The Democrats would be entitled to more credit for their sacrifices made in order to conform to "the new order of things growing out of the war" if they had preserved such of "their traditional and inherited convictions" as did not conflict with this order. But as they have from time to time since the war thrown overboard every one of these convictions in order to win elections, and are really no longer recognizable by those who knew the party before the war, we do not think they can be so sensitive as our correspondent seems to suppose. We acknowledge freely that the Republican press has been guilty of both falsehood and exaggeration in describing the difficulties thrown in the way of negro voting; but any one who says he does not "know" that there exists any such difficulties at all must be set down as a person who does not take the trouble to follow the events of the day. We quite agree, however, that the most efficient and perhaps only permanent protection of the negro voter will come from a division of the whites, and the strongest objection to the attempt to array the North against the "Solid South," and blackguard the South *en bloc*, is that it will postpone this division indefinitely. But whatever may have been the state of things before the war, the *fact* is that since the war a large body of voters, possessing no physical or mental force, have been added to the Southern constituency, and that they are, as voters, viewed with dislike or contempt by the least peaceable and orderly portion of the Southern whites. It is also a fact that they have been made voters by Amendments to the Federal Constitution which have armed Congress with new powers. Therefore, the state of things which existed before the war, and which the State authorities then dealt with efficiently, no longer exists, and a new state of things does exist, which we do affirm it to be dishonest for a party to pretend not to see and to refuse to provide for in any way. The Republican way may be bad—in some of its features, the deputy marshals for instance, it is atrociously bad; but any one who seeks to abolish it is bound, we still maintain, to propose something in its place, and ought not to allege that the electoral machinery which was good enough in South Carolina in 1860 is good enough in 1879. About the soldiers at the polls, all we need say is that we do not stickle for them, and think the use made of them at the South during the carpet-bag régime was abominable; but it makes to us all the difference in the world whether soldiers used to preserve peace at the polls in a country in the condition of the South are a detachment of ten men from a scattered army of 20,000, or a detachment of ten men from a compact army of 200,000. Objection to the latter might be grave when objection to the former would be ridiculous. In passing on questions of this kind reasonable men take all the circumstances into account. There is nothing inherently terrible in a soldier *per se*. His danger as a policeman depends on the size, organization, and disposition of the force to which he belongs. Our correspondent's account of the supervisors may be and probably is true; but the contrivance is on its face a fair enough one, and the Democrats, if they choose, by concert with the Republicans might make it efficacious enough. But they persist in opposing to the Republican fictions about the South other fictions of their own, which if not so mischievous are still mischievous.—ED. NATION.]

Notes.

THE prevailing rage for twice-told tales in biography is to be still further gratified by Macmillan & Co., who intend issuing a series of small volumes upon Greek, Latin, and English authors whose works are studied in schools. Mr. J. R. Green will be the editor, and among his assistants are Prof. James Bryce, Prof. Mahaffy, Rev. Stopford A. Brooke, Mr. F. J. Furnivall, and others. The same house issue this week 'Mixed Essays,' by Matthew Arnold, of which those on Democracy, Equality, Irish Catholicism, and British Liberalism have already appeared in the *Fortnightly* and *Nineteenth Century*.——Mr. A. R. Spofford's 'American Almanac for 1879' is a good second to the first volume, and is to a large extent composed of new matter. We need only mention the official statistics of the States, giving in brief compass the personnel of the principal State officers, the constitution of the judiciary, the last election totals, the debt, expenses, taxes, etc.; the election statistics of 1878 for all the States; the insolvent laws of each; and general articles on the census, the history and principles of taxation, on specie resumption in England, etc. We regret to learn from the preface that this useful work did not pay for itself last year, and that its continuance depends upon the reception of the present volume. Very desirable, if the series is to

go on, would be the publication each year of the preceding indexes; better still if they could be incorporated in one index, with typographical distinction of the current contents.——Daniel Slote & Co., 119 William Street, who are the publishers of Mark Twain's happy device for a scrap-book, have brought out 'The American Plant-Book,' a well-imagined blank-book for the preservation and scientific record of flowers, ferns, leaves, and grasses. Instructions for collecting, drying, pressing, and mounting are given, and tabular pages are intercalated for the description of the mounted specimens. The book deserves the attention of amateurs. When filled it is all ready for the shelf.——Geo. Routledge & Sons have issued the tenth edition of their valuable 'Men of the Time,' in which a great number of changes are to be noted. Among the American accessions by good right are Rutherford B. Hayes and Samuel Jones Tilden, together with Secretary Sherman. Mr. Schurz was already in the edition of 1875; but Mr. Timothy Howe does not yet appear to have come within the editor's horizon. Among our men of letters Mr. Higginson and Mr. Howells find a place for the first time; perhaps in the next issue Mr. James's title will have been made clear. We have not looked for shortcomings, but if the editor will follow up his reference from Alecsandri (the Rumanian poet) he will see that nothing comes of it.——Number (11) of the Harvard Library Bulletin begins a noteworthy list of instruments of precision "available for scientific researches involving accurate measurements," which has been obtained by circular addressed to heads of colleges, etc. They are, under restrictions imposed by their owners, "at the disposal of any properly qualified person for the purposes of investigation." The Coast Survey Office, American Academy of Arts and Sciences, and several departments of Harvard University, report in this number.——The late Congress appropriated the sum of $250,000 towards erecting what will ultimately be a wing of the National Museum at Washington, in accordance with plans proposed by officers of the Smithsonian Institution, whose building it will adjoin. It will cover two and a quarter acres, and can be finished in the course of a year. That the same body should not further have distinguished itself by liberal provision for a National Library building is much to be regretted.—— The popular-science series of brochures edited by Virchow and Von Holtzendorff (*Sammlung gemeinverständlicher wissenschaftlicher Vorträge*) has now reached Nos. 313, 314 ("Blücher") and 315, 316 ("On Deep-Sea Animals"); while the parallel and complementary series of *Zeit- und Streit-Fragen* (or *Burning Questions*, as it might be called), edited by Von Holtzendorff, reaches No. 113 ("On the Materialistic and Idealistic View of the Universe"). It is doubtful whether in a country so well provided as ours with periodicals and newspapers similar publications could sustain themselves; yet one cannot but wish that we might have a similar medium of communication between learned authority and the magazine-reading class. Carl Habel, Berlin, is the publisher (New York: L. W. Schmidt.)——A subject not well understood, "The British Peerage," is to be treated by a lecturer thoroughly acquainted with it, Mr. Reginald Lewin, at the Union League Theatre, on Tuesday and Friday afternoon of next week. The treatment will be historic, but not without enlivenment.

—Harper & Bros. make public in a neat brochure a letter addressed by them last November to Secretary Evarts in respect to International Copyright. They recall the overtures made by Great Britain in 1870, and the reason why these failed to lead to any understanding, and urge the propriety of the United States now in turn taking the initiative. For this purpose they suggest an arrangement by which the Secretaries of State in both countries shall appoint a joint commission or conference of eighteen American citizens and British subjects, equally divided, and consisting on each part of three authors, three publishers, and three jurists; their deliberations having for an end the adoption of an international treaty, which would serve as an example for other countries. We do not know what steps Mr. Evarts may have taken in accordance with this suggestion, but we are very clear in our belief that it deserves to be acted upon and that the chances of a successful issue are very great. To the copy of their letter the Messrs. Harper append the convention proposed by Lord Clarendon in 1870, side by side with amendments proposed in America; Mr. Wm H. Appleton's plain-spoken letter to the London *Times*, in October, 1871, and the draft of a bill proposed by him for Congressional adoption in 1873; and an extract from Mr. Geo. Haven Putnam's recent address on international copyright. These "Memorandums," taken together, show a disposition on the part of American publishers entirely favorable to the protection of literary property wherever owned, and ought to persuade Englishmen of the good faith of the present movement.

—The sale of the first third of the Brinley library closed on Saturday night, when the total receipts were found to be $48,830 75. We can notice only a few of the higher-priced rarities. The catalogue opened with books relating to America in general, and accounts of voyages of discovery, among which the following were notable: Sir Francis Drake's 'Expeditio in Indias Occidentales,' with maps (Leyden, 1588), $110; Sir Humphrey Gilbert's 'Discovrse of a Discouerie for a new Passage to Cataia,' Heber's copy (London, 1576), $225; the famous 'Peter Martyr,' the copy used by Richard Eden in translating 'The Decades of the Newe Worlde,' $100; a fine copy of Champlain's 'Voyages,' with map (Paris, 1632), $280; John Brereton's 'Briefe and True Relation of the discouerie of the North part of Virginia' (London, 1602), and James Rosier's 'True Relation of the most Prosperous Voyage, made this present Yeere, 1605, by Captain George Waymouth in the Discouerie of the Land of Virginia" (London, 1605), both beautifully bound and enclosed together in a morocco case labelled, "The Verie Two Eyes of New-England Historie," $1,600; Captain John Smith's 'General History of Virginia, New England, and the Summer Isles' (London, 1624), remarkable as being the dedication copy of the first edition in its original binding of dark-blue morocco, richly gilt, with the arms of James I. stamped upon one side of the cover, and those of the Duchess of Richmond and Lenox, to whom the book was dedicated, upon the other, was purchased by the Lenox Library for $1,800. The 'New English Canaan' of Thomas Morton, uncut, brought $180, while another copy cropped by the binder sold for $37 50. 'The Meritorious Price of our Redemption, Justification, etc., Clearing it from some common Errors, etc., by William Pinchin, Gentleman, in New England,' on the guard-leaf of which are the autographs of Crescent Mather, 1653, and Cotton Mather, 1673, was a copy of the first edition, which the General Court of Massachusetts "utterly disliked and detested," and ordered to be "burned by the executioner in the market place in Boston," the author having dared to maintain the "damnable heresy that Christ did not suffer for us those unutterable torments of God's wrath that commonly are called hell torments," $205. Five almanacs printed at Cambridge, 1646–1650, comprising specimens of the work of the first three printers in English America, found a ready buyer, as well as 'A Declaration of Former Passages and Proceedings Betwixt the English and the Narrowgansetts,' the only copy known to be extant. Eliot's Indian version of the New Testament fetched $700. White Kennett's copy of the first edition of Eliot's Bible, containing both the Old Testament and the New, was sold for the single bid of $1,000. The 'Bay Psalm Book,' the first book printed in the British American Colonies, by Stephen Daye, Cambridge, 1640, brought $1,200. The *American Magazine*, from 1744 to 1746, three volumes, sold for $75. The *Royal American Magazine* of the same period, and the *Boston Magazine* and *Boston Gazette* of later date, were also highly valued. The first edition of the 'Connecticut Colonial Laws,' printed at Cambridge in 1673, is the only copy of the work which has been offered for sale during this century; it brought $300.

—In the April *Atlantic* most readers will turn first to Mr. Henry James, jr.'s account of "The Pension Beaurepas," a sketch of some Americans at Geneva, which, although it is amusing and realistic, does not provoke such lively interest as his latest stories, perhaps because all the principal characters described are very disagreeable, and in such way as to make one sad rather than angry; nor are the mistress of the pension and the old Frenchman prominent enough to mollify the reader with their pleasant peculiarities. Mr. James should make us laugh more at his satire, or else he should put more that is delightful in itself into his work; as it is, we sometimes yield him our sympathies to be tortured by him. The promised "Irene the Missionary" hardly affords grounds for anticipation of its merits in the first five chapters here printed. The description of the voyage of the missionary party through the Eastern Sea to Rhodes, Cyprus, and Beirut affords an opportunity for some very romantic natural description, and Irene herself is made charming from her first appearance, although she does not show any distinctively individual quality as yet. The other literary articles are an interesting collection of Easter hymns written by the monks; a discussion of New York theatres, in which the author asserts with much confidence that there has been considerable improvement in this art within a quarter of a century, and assigns some very probable reasons for our backwardness in it; a courteous but severe criticism of Mr. Story's design for the Washington Monument, which points out how incongruous an Italian structure will be in the locality where the monument

is to stand, and indicates in detail the reasons why the design is likely to be ineffective as an artistic work; lastly, an article by Richard Grant White on "Living in London," which is full of a gossipy information and entertaining, but we cannot help feeling that he opens his bedroom door a little too wide for good taste. There are two other striking contributions, one from a workingman, to tell workingmen that the rational solution of their difficulties is not in checking production, for which they have only shortsighted, tyrannical, and ineffective means, but is in attending to the character of their own consumption, and seeing that they spend so as to afford employment to others instead of unproductively; the second is upon "The Indian Territory," and contains a description of the Indians settled there, their laws, habits of government, expenditures, resources, etc., with a discussion of the wisdom of opening the Territory to white settlement.

—The Legislative, Executive, and Judicial Appropriation Bill as introduced into the late House of Representatives contained provisions following strictly the report made by the National Academy of Sciences, relative not only to the national surveys of a scientific character, but to those of the Land Office. It directed the discontinuance of the geographical and geological surveys of Dr. Hayden and Major Powell under the Interior Department, and of that in charge of Lieutenant Wheeler under the War Department; also abolished the existing surveys under the Land Office, and provided that the Coast and Geodetic Survey should be transferred to the Interior Department, with its title changed to Coast and Interior Survey, and assume the entire mensuration of the public domain, excepting only those surveys necessary for immediate military purposes, local improvements, etc., which were left to the Engineers of the Army. It further established an office of Director of the Geological Survey, to be appointed by the President with the advice and consent of the Senate, and defined the duties and powers of that survey. A commission was also created to report a codification of the present laws relating to the survey and classification of the public domain, a system and standard of classification, and a plan of land-parcelling adapted to the several classes.

—What followed is a curious illustration of the course of legislation in this country. In the long debate upon this section in the House the chief opposition shown was to the immediate abolition of the offices of the sixteen surveyors-general, which are political appointments made during late years under Republican rule; and on the ground that no change should be attempted in this direction until after the report of the commission provided for, the Republicans, being joined by a sufficient number of Democrats, succeeded in striking out the paragraphs on that one subject. In the Senate, besides slight verbal alterations, an addition was made, as recommended by the Senate Committee, allowing twenty thousand dollars to each of the discontinued Hayden, Powell, and Wheeler surveys to finish their work. In the meanwhile the Sundry Civil Appropriations Bill had been rushed through the House in such an incomplete shape, with reliance upon Conference Committees for correction, that the appropriation of one hundred thousand dollars to carry into effect the provisions of the survey part of the Legislative Bill was eked out with blanks referring to the last-mentioned bill, as if it had in fact been passed and approved at a date yet unknown. When it was evident that the Legislative Bill would fail in the Conference Committee on account of its political riders, the chairmen of the Appropriation Committees of both houses, happening to be on the Conference Committees on both bills, agreed to save the reform by removing it from one to the other. In the compromises, however, the part relating to the increased powers of the Coast and Geodetic Survey, with its change of title and transfer from the Treasury to the Interior Department, was omitted. The net result, therefore, is a law establishing the office of Director of the Geological Survey, at a salary of six thousand dollars, an appropriation of one hundred thousand dollars for the expenses of that office during the next fiscal year, the definition of its duties and publications, and the creation of a commission permitted to expend twenty thousand dollars in preparing a further report within one year—all substantially in the terms recommended by the National Academy of Sciences. The status and duties of the Coast and Geodetic Survey and of the surveyors-general remain unchanged, but the three temporary organizations above mentioned under the Interior and War Departments are discontinued from the 30th of June next, with twenty thousand dollars for each to close up its work and complete its publications. The new and permanent office of Director of the Geological Survey will be one of the most important and most practically useful in the country. The prominent candidates for the President's nomination are Dr. Hayden and Mr. Clarence King, Major Powell having, in favor of the latter, declined to present his own claims, though he warmly supported the plan of the Academy, the success of which is largely due to his exertions, in spite of its apparent conflict with his personal interests.

—Le Monnier's successors, Florence, send us the first fascicle of a 'Dizionario Biografico degli Scrittori Contemporanei' (Aars–Baccaredda), edited by the untiring Prof. Angelo de Gubernatis. The idea of this dictionary was conceived some ten years ago, we are told; that is to say, when the editor was barely twenty-nine years of age, and had not yet acquired an international reputation. The thought of his youth and literary obscurity determined him to wait till time and his own energy had changed all that; and now that he flatters himself to be tolerably well known all over the republic of letters he invites his colleagues to the hospitality of the 'Dizionario,' and in return for their information about themselves he will not do them the discourtesy of refusing to "exchange cards": "sento l'obbligo mio di confessarmi, per mia parte, con la stessa fiducia, ad essi." He does this, not in his alphabetical place in the body of the work, but in a long "autobiographic proemium," to which the word confession is not improperly applied, there being even a resemblance to Rousseau's 'Confessions' in the school incident of the badge of merit unjustly taken from him ("Io non ho dimenticato ancora la dolorosa impressione ricevuta per quell' atto"), and in the planting of the Indian horse-chestnut, more fortunate than the willow for which the famous "aqueduct" was devised. Prof. de Gubernatis was born in Turin, "of a noble and ancient family established in Piedmont since the twelfth century," April 7, 1840, the seventh son of Chevalier Giambattista de Gubernatis, then employed in the Ministry of Finance. The father is further described as an active and practical philanthropist, of wide learning (*enciclopedista*), a man of few words but resolute performance, and a severe disciplinarian. We pass over the interesting details of the young Angelo's precocity at school, of the histories and biographical dictionaries he began and partly achieved, of his friendly disposition towards the sciences and his disgust at mathematics; of the private literary academy he founded; of his translations from Plautus by way of preparation for the University; of his first visit to the theatre, when (lucky youth) he saw "Hamlet," and received a "profound impression," so that he at once wrote out a drama in verse of his own. The playwright side of De Gubernatis's intellectual fecundity will be perhaps to foreigners the chief revelation of this autobiography. The first journal of his founding was *L'Italia Letteraria*. Chance led him to betake himself to Semitic studies; and ambition, to repair to Germany to prove that an Italian could study like a German. University honors awaited his return, and as Professor of Sanskrit he went to live in Florence in October, 1863. Here an evil chance threw him in with Michael Bakunin, the Russian socialist, whose influence proved irresistible, and in Febru ary, 1865, De Gubernatis resigned his position that he might be free to attack the established order of things. The story of his experience while laboring under this mania is very interesting, and has a romantic complexion because the new apostle of socialism gained a Russian wife by his temporary connection with Bakunin; and much domestic happiness, as is to be seen from the verses addressed to his children, *dolce Cordelia* and *prode Alessandro*. By-and-bye sanity returned; he broke with secret societies and red republicanism, and the Government generously received him back as a public instructor in the spring of 1867, and a sadder and a wiser man. His apology for his error and his return to the ranks of conservative monarchists, and an account of his multifarious literary work since the dawn of his new life, conclude one of the most readable chapters in contemporary memoirs.

—As for the *capolavoro* to which this proemium leads up, we may leave one side the question whether its merits are so great as to make it the natural occasion on which to take the world into the editorial confidence. It at least does for the author's obscurer countrymen what no other dictionary or cyclopædia does, and it is original as well as handy in embracing only the men of letters of all nations. It has had the advantage of special editing for the Dutch, Rumanian, Polish, Bohemian, and Croatian portions; and in what concerns Greece, Servia, Hungary, Russia, and Scandinavia it promises to be exceptionally full and correct. For this reason it must prove a welcome addition to even the best lexicons, and one has only to compare the *Dizionario* with Brockhaus to be persuaded that such is the fact. The execution is not remarkable in the editing at second hand, while there is a lack of proportion arising from the too free use of inedited materials, of which the most glaring in-

stance is the space given to Madame Ackermann—more than three pages. This exceeds the allowance to About or to Augier, to Auerbach or Asbjörnsen, to Albini, Amari, or Antinori. Still, if the purchaser does not pay too dearly for it, faults of excess are easily overlooked in a book of reference. Dictionaries of a broader scope would grudge the room required to state that About succeeded Philarète Chasles as the French literary correspondent of the *Athenæum*, and still holds the position ; but there is freshness in such particulars, and even an insufficient notice like the following shows a certain alertness which is commendable : "Angyal, John, a Hungarian writer, published in 1878 a translation of the 'Divina Commedia' in Hungarian." Finally, we must praise the idea of inserting portraits of the writers whose lives are sketched, though such as we are able to judge from photographs or otherwise—*e. g.*, About, Dom Pedro, Matthew Arnold—leave something to be desired. Thirty of these adorn Part I., which contains upwards of two hundred titles. The work is, so far as we have tested it, essentially accurate. The American portion is of course meagre : few of our great names are enrolled under the first letter of the alphabet. The Abbotts, Jacob and Lyman, are denied their final *t ; Timothy* Shay Arthur appears as *Tommaso ;* "Oliver Optic" is the only Adams admitted from this side of the water among the *scrittori contemporanei ;* Miss Alcott is not overlooked, but neither Mr. Alger nor Mr. Allibone is honored with a mention.

—Prof. Karl Knortz, who has just published in German (Boston: Carl Schoenhof) a critical study of the writings of Longfellow, some of which he has himself translated, is now engaged in compiling an anthology of modern American lyrics for a Berlin house. The collection, when made, should have its usefulness among us also, for, from the fact that it is meagre or the reverse, some interesting conclusions may be drawn as to the bent of the American genius for poetry. It will also facilitate an enquiry into the relation (whether as cause or effect) between poetry and music in the United States. Mr. Longfellow undoubtedly enjoys as a song-writer the position held in England by Mr. Tennyson, and he may on that side of the water have received the compliment, so profitable in the case of the latter, of being frequently set to music. At home his "Hiawatha" inspired a respectable yet still-born opera, and occasionally one hears a piece of his in the concert-room; but as regards either the parlor or the streets he is, like his fellow-poets, practically unsung. We recall one love-song of Lowell's of which the music is unpublished, we believe; Dr. Holmes can point to at least one bit of "occasional" verse expressly set to music by a competent hand; Whittier can hardly do more; Emerson perhaps not so much; Pierpont, though often sung, generally if not always found the air ready-made. What one of these poets, in our civil war, enlivened the tedium of the camp with songs of sentiment or affection, or stirred the blood with strains that twenty years had made familiar to the generation that took part in the anti-slavery struggle ?

—Reflections like these are sure to arise on looking over any German collection of popular melodies, such, for example, as G. W. Fink's 'Musikalischer Hausschatz der Deutschen,' embracing a thousand numbers, now appearing in a new edition (Part I., Hamburg : Haendcke & Lehmkuhl ; New York : L. W. Schmidt). In a note to "Gottes Rath und Scheiden" the editor remarks: "The words are by Ernst Freiherr von Feuchtersleben, in imitation of ancient German poesy; one proof more how many of the so-called folk-songs sprang not from the people in the secondary sense of the word, but from considerable poets." And, indeed, among the writers of the 333 songs of the part before us one meets with such names as Luther, Lessing, Bürger, Goethe, Schiller, Herder, Matthias Claudius, Kotzebue, Uhland, Arndt, etc., etc.; as among the composers with Mozart, Weber, Mendelssohn, Schumann, etc. The first 220 songs are "Volkslieder" proper; the remainder "Jugendlieder." Favorites like "Die drei Reiter," "Einsam bin ich nicht alleine," "Der Wirthin Töchterlein," "Der Zimmergesell," "Das Mädchen aus der Fremde," occur in this as in every collection; but one is struck more by the points of difference than of resemblance, since these suggest the endless wealth of songs which will continue hereafter as heretofore to give employment to editors like Herr Fink, himself a popular poet-composer. To the same air are frequently appended several sets of words, and on the other hand words familiarly associated with a certain air are here set to quite a different one. As for the "Jugendlieder," the songs of youth, what like them have our American boys and girls; and what is the common body of school and home melodies, from nursery to college, that children from Massachusetts to Minnesota (to go no farther West) know by heart? We could not answer the enquiry lately made by an eminent German scholar visiting this country for a characteristic collection of this sort.

—A very significant little pamphlet by Helmholtz which has just appeared in Germany recalls to mind the assertion of G. Kirchhof, made some years ago when these two leaders of physical science had already expressed very different views respecting the nature and limits of knowledge. The latter held that all logic was definition, and that mechanics was only the description of motion. Helmholtz seems now to have concentrated his interest on questions which, in the new latitude which that word has lately acquired, may be called psychological. The greatest intellectual progress of recent years, he says, is the analysis of the supposed simple processes of vision and audition into many more ultimate and simple processes. These latter language (which is a product of a relatively perfected consciousness) is not capable of describing save by circumlocution and wide analogies. This result has led scientific men back to the standpoint of Kant's 'Critique,' but with a slightly different solution of his problem. Space, for instance, is an innate force in so far as its perception depends on the possibility of motor impulses of the will ; yet its existence does not belong to the mind as color does to the eye, but is demonstrably real and objective. This, however, is very distinct from the question of the contents of space. This question, now so widely known as that of the fourth dimension, may be very simply stated—viz., Are geometrical axioms transcendental forms of perception or products of experience ? Helmholtz holds the latter to be possible, and insists that by a little knowledge of analytical methods, of mathematics, of perspective construction, and of optic phenomena spacial relations which contradict the three central axioms of Euclid may be distinctly conceived, and that the series of sensuous impressions which would arise in a metamathematical space developed within the parts of the Euclidean space, can be fully and serially described. It is difficult to think in terms of such a space simply on account of our lack of experience. The motive of all knowledge is the law of cause, which never leads to a final cause or hypothesis, but only expresses an instinctive trust in the perfect comprehensibility of the Universe. We have no guarantees for the validity of any given application of the law of cause save its practical result. This law is *à priori*, is primal instinctive induction. In the persistency of force, in physiological processes of sensation and thought, in geologic times and astronomic space, in the physics of light, sound, electricity, etc., we have already far higher, more philosophic, and more religious themes than any of the Oriental dreams of pantheism or modern idealism, which, like everything purely subjective, can never be finally disproved.

CONWAY'S DEMONOLOGY.*

A SCOTCH song says that the devil is dead and buried at Kirkcaldy ; but Mr. Conway is ready with the biography of the deceased, prefacing it, as biographers are wont, with a complete genealogical history of his ancestors. As many American family records carry us back to three brothers who emigrated simultaneously, so this book traces back to Demon, Dragon, and Devil every figure of ill-omen that has perplexed the world. Since Mr. Conway first wrote the 'Natural History of the Devil,' in this country, twenty years ago, the subject has haunted him ; he has explored libraries in its behalf, ransacked the British Museum, visited cathedrals ; he has had the aid and counsel of men like Tylor, Lubbock, and Max Müller ; he has given a course of lectures on this theme at the Royal Institution in London ; and these lectures, still further expanded, take form in two thick octavos, profusely illustrated and crowded with information, quotation, and allusion. Mr. Conway's long practice as a journalist has given him the literary instinct as to selection and arrangement ; he is always readable and commonly spicy ; and, while his book has, to our thinking, some marked faults, it has predominant merits which do him honor and make the work a real addition to the history of human thought.

Of the three forms of evil power which he discriminates, the elder birth is assigned to the Demon. This first-born of the dark brood, according to Mr. Conway, was not, as in Milton's definition of Lucifer, "archangel ruined," but a far less developed power ; he simply worked evil indirectly in pursuing his own ends, but he had no special love of evil, no malevolence. He had no moral or immoral character, any more than the man-eating tiger. Indra slays Vitra without moral indignation ; Apollo's face is serene when his dart pierces the Python. "It required a much higher development of the moral sentiment to give rise to

* 'Demonology and Devil-Lore. By Moncure Daniel Conway, M.A.' With numerous illustrations. 2 vols. 8vo. New York : Henry Holt & Co. 1879.

the conception of a Devil. Only that intensest light could cast so black a shadow across the world as the belief in a purely malignant spirit" (i. 13, 14). A devil loves evil for its own sake ; a demon is simply the embodiment of some natural power or bodily need, and has no malevolence, but only a heedless self-seeking. This distinction is intelligible and well-sustained. The Dragon, in Mr. Conway's view, is an intermediate type, and is perhaps more arbitrarily employed ; still, our author finds abundant material for his delineation, and can classify for this purpose all the vast collection of saurian and lacertine myths ; the Garden of Eden, Uther Pendragon, St. George and the Dragon, the Lambton Worm, Melusine, and Elsie Venner. All this series of traditions came from a combination of uncanny objects, the Egyptian crocodile, the fragments of saurian monsters, and the malign and stealthy movements of the snake. The basilisk is of the same family, and the cockatrice, which is *cocatrix* in Old-French, and *cocotriz* in Spanish, is simply another name for the crocodile, once little known and deemed half-fabulous.

The first volume, which relates to the demons only, is the best sustained, most systematic, and least digressive part of the book ; it is, indeed, an excellent piece of literary work, from beginning to end. Later, the author grows more polemic, being brought into closer antagonism with the more forbidding aspects of Christian art and tradition, and thence easily passing to the offences of the contemporary church. In the first volume he writes as a student of human history and art, pure and simple ; he has collected materials with immense industry, and has found in every mediæval church-building a botanizing ground for new species of these baneful blossoms of superstition, the demons. For it must be remembered that it was not the saints and heavenly virgins which most taxed the ingenuity of the myriad unknown architects and artists of those days, but the demons who glared from the gargoyles and leered from the cornices, and doubtless represented to many pious minds the pagan deities that had been cast out. The portrayal of the powers of good was often conventional and feeble ; but that of the demons was endlessly quaint and vigorous and varied, as the visitor to Rouen or Nuremberg knows well. Many a myth otherwise meaningless is traced by Mr. Conway from cathedral to cathedral, as patiently as Colonel Chester tracks an American family record from one set of English church records to another ; and where the Roman Catholic Church fails, the Greek Church helps him out. His travels in Russia have furnished him with a store of quite new material in this direction, and with some of his most unpleasant and instructive wood-cuts. There it is that he finds a "Dives and Lazarus" in which Satan is inflicting an infernal baptism on the condemned soul, to correspond to the religious ceremony (i. 281); and there he finds the missing delineation of the diabolic trinity, piously arranged to match the heavenly; the "procession of the Serpent of Sins" in which the snake appears as the counter-agent of the celestial dove (ii. 253). But, indeed, his wealth seems endless ; and he reminds one of the German monks, mentioned in his own preface, who hid themselves near the witches' orgies, that they might count the demons, when the chief of these, discovering the intruders, said : "Reverend Brothers, our army is such that if all the Alps, their rocks and glaciers, were equally divided among us, none would have a pound's weight."

This first volume describes the twelve chief classes of demons—namely, of Hunger, Heat, Cold, the Elements (storms, lightning, tides, etc.), Animals, Enemies (as giants, dwarfs, were-wolves, etc.), Barrenness, Obstacles (mountains, rocks, whirlpools, etc.), Illusions (mermaids, swan-maidens, phantoms, etc.), Darkness, Disease, and Death. It is curious under all of these to see the constant connection between ancient practices and modern ways. Take, for instance, the demons of cold. The old New England farm-house, with its door fronting the south, may not have been so placed merely because of the warmth on the doorstep or the convenience of knowing just when noon-time came, but it may have been a survival of the tradition which bade the doors of English parish churches face south, recognizing that evil spirits dwelt northward. On the Continent, witches sometimes heard their parents calling them from England ; in England they were ascribed to Norway as a colder region, or to the Hebrides, where fire is still carried round the cattle to protect them from demons of cold. Brand and others have pointed out that the south side of a church-yard was often the consecrated part, the north side being reserved for unbaptized infants and executed criminals, so that people were allowed to dance and play tennis there. In some parishes in Cornwall, when a baptism occurs, the north door of the nave, opposite the font, is thrown open, so that the demon cast out may return to his own home, the north. Thus, in the prose Edda, the hall of punishment, whose walls are made of wreathed serpents with their heads inward, opens only towards the north (Conway, i. 85–7).

Our author draws his materials not from the carvings of churches and the vagaries of oral tradition only, but from the quaintest treasures of European libraries. He has inspected, for instance, the 'Raven Book' at Dresden, printed in 1501, and professing to give all the wondrous secrets of Faust. Its cardinal rule for magic is that the "magister" should mark a circle on parchment with a dove's blood ; should write in Latin, within that circle, the names of the four quarters of heaven ; should inscribe around it the Hebrew letters of God's name, and beneath it write *Sadan;* and, standing in this circle, should repeat Psalm xci. In this book the infernal hierarchy are inscribed as formally as are earthly dynasties in the *Almanach de Gotha:* "*King*, Lucifer ; *Viceroy*, Belial ; *Gubernatores*, Satan, Beelzebub, Astaroth, Pluto ; *Chief Princes*, Aziel, Mephistopheles, Marbuel, Ariel, Aniguel, Anisel, Barfael" (Conway, ii. 299, 333).

He has also examined the *Fan's Bibel*, or 'Devil's Bible,' in the Royal Library at Stockholm. It is supposed to be the largest book in the world, and requires more than one man's strength to lift it from the floor ; it contains three hundred parchment leaves, each one made out of an ass's hide, the cover being of oak planks. It was part of the booty carried off by the Swedes after the surrender of Prague, A.D. 1648 ; it bears the signature of a German emperor in 1577, and no one knows how much older it may be. Within its covers are the Old and New Testaments, Josephus, and several other works, including a treatise on "Evil Spirits" and various prescriptions in "White Magic." The legend is that a monk, condemned for witchcraft, was granted his life on condition that he should reproduce before morning all the books here contained ; and, with Satan's aid, he wrote this volume in a night (ii. 283–4).

Mr. Conway's tracings of myths through successive languages affect one often like a series of puns. Godiva becomes Good-Eve (ii. 89) ; he tells us that "Devel" is the gipsy name of God, and that "deuce" is the Armorican *teuz*, a phantom (i. 16). The "Thou shalt not be afraid of any *bug* by night" of the Bishop's Bible—and, he might have added, the "Tush, tush, fear boys with *bugs*" in "Taming of the Shrew"—recalls the familiar "bogey," the Welsh "bwg" (goblin), the Slavic "bog" (deity), the "Baga" (God) of cuneiform inscriptions, and the "Bhaga" (Lord of Life). There is always danger, however, in these striking analogies. We can remember to have found momentary weight in the suggestion that "elf" and "goblin" were clearly derived from Guelf and Ghibelline, until a little reflection showed the supposed derivatives to to be really the older words.

Mr. Conway has his own theories of Adam's fall ; and while he is convinced that the forbidden fruit was the physical relation of the sexes, he yet keeps wholesomely clear of the tendency of the Payne Knight school to find some indecency in every ancient symbol. He restores Lilith—who is known to most persons only as a figure in Goethe's 'Faust'—to a picturesque and important place in tradition. The legend is from the rabbinical traditions ; they represent her to have been created with Adam in the same way, but to have refused to obey him, asserting that they were equals. This being denied, she gave herself wings by magic and flew away ; three angels found her hovering over the Red Sea and tried in vain to bring her back, but she would not come, was divorced from Adam, and Eve was then created from his side, that there might be no question of supremacy. Lilith had power over Jewish children till the eighth day, but promised the three angels to disturb none whom they protected, so that Jewish children formerly wore a charm bearing these angels' names. She conspired against her rival Eve, and was held by many to have been the real tempter, in guise of a serpent ; Pietro d'Orcagna thus painted her at Pisa, and Michael Angelo in the Sistine Chapel, in a beautiful fresco which Mr. Conway gives (ii. p. 97). In 'St. Mary's Psalter' (1553) she appears offering apples from the tree to Adam and Eve, the temptress having the head of a woman, the body of a cat, and the tail of a serpent (ii. 301)—a conception that Charles Baudelaire might have envied.

Some of our readers may have noticed at Notre Dame, in Paris, this last summer, a bird's-nest built between the projecting horns of a carved fiend, where the mother-bird sat peacefully upon her eggs. This graceful combination has not escaped Mr. Conway, and the artist Hennessy has commemorated it in a vignette which appears both within and without the book. The whole work is a mine of curious learning and vivid delineation ; sometimes it is too polemic, has too many local and temporary allusions, and the latter part is too discursive, as if the author had grown a little weary with his long labor ; nevertheless, it is a work well

worth doing and, on the whole, faithfully and felicitously done. It might be said to Mr. Conway, as he tells us that a bishop wrote to Father Delaporte about a similar work: "Reverend Father, if every one busied himself about the Devil as you do, the Kingdom of God would gain by it."

The Lady of the Aroostook. By W. D. Howells. (Boston: Houghton, Osgood & Co. 1879.)—Mr. Howells's story, the pleasant qualities of which we have called attention to from month to month, has deservedly received universal praise. It is rightly called the best work he has yet done—quiet in interest, finished, well conceived in its proportions, well executed. He has described with the accuracy almost of self-consciousness a type of the girl whom our New England village-life produces. Our modern inherited Puritanism has not found so fine an illustration before, nor has the *aplomb* quality of Puritanism been better delineated, for it is this which underlies the simplicity of the heroine's self-possession, which springs from ignorance; her self-confidence, which makes her think she guards herself when others are really guarding her; her self-repression, which yields so slowly to the influences of the larger life made known to her; and her self-belief, the tenacity with which she holds to the conventions of her training and to the absolute rightness of her convictions, which caused her violent and sudden revolt from the customs of Venetian society. Mr. Howells has made himself acquainted with this character, and has realized it with the faithfulness of portraiture, just as he has succeeded equally well in the easier task of painting to the life the good, stupid Dunham, commonplace Staniford, and the Venetian aunt. The story is so simple, the taste so nearly flawless, the success in what was attempted so undeniable that one distrusts his judgment when he finds a vague regret in his mind as he reads and after he has laid down the book. This being so good in its kind, would anything be better? But we must confess to sharing this regret. Like Mr. James, Mr. Howells is a realist—he copies life; and realism in literature, although not so plainly a disappointment as in art, is quite as unsatisfactory. The poor we have with us always—Dunhams and Stanifords and Hickses in shoals. What is valuable in literature is not the miniature of life, but the illumination of life by the imagination; not common things set in the light of common day, but the revelation of what is hidden in common things by the light that never was on sea or land. To say this is not to detract from the author's praise, but rather to add to it by saying that, though what he has given us is good, there is better than it for him to give us. He has imaginative as well as portraitive power. We wish he would employ both, giving to himself more freedom, binding himself less to his object, and so show us things not merely as they are under present conditions, but as they are best under present conditions. Our regret is that Mr. Howells has built in stones of the street when he might have built in more durable and beautiful material. But, not to press this too strongly, for it lies in the choice of the author and not in that of his friends, there seems to us one other defect in the workmanship of the story. It is less strong as a whole than in its details. The charm of it lies not in its very subdued incident and plot, but to a considerable extent in its minute felicities, in half-sentences, half-lines, sometimes in single words and the turn of a phrase, in the attitudes, movements, and *belongings*, rather than in the theme itself—an error which is avoided only with great difficulty when the mode of work is so painstaking as it evidently is here. To write in this way is to appeal to the reader by moments, to please the greatest number, because it is easiest to please by moments; but it is to lose form, for when one thinks of the story a multiplicity of details come back to his memory, which has lost in them the great lines that alone make a whole of any artistic work. Notwithstanding all this, we are glad that this story has met with so much favor, and in closing this brief notice of it we cannot refrain from calling attention to the contrast between it and 'Daisy Miller,' for the type of American girl which it describes is so fundamentally different, so much more frequently met with, and so much more peculiarly national—or, rather, the product of native conditions—that the contrast cannot fail to be instructive to any who may develop it in his own mind.

The Gamekeeper at Home. Third edition. (Boston: Roberts Bros. 1879. 12mo, pp. vi. 216.)—This little book is delightfully earthy. The gamekeeper on a modern English estate; his house, tools, family, caste; his dominions in wood, meadow, and water; his various subjects, from mice to foxes; his enemies, feral and human, birds and beasts of prey, thieves and poachers, and the effective "leathering" of the same with a good, tough ground-ash stick; and worst of all, of late years, the predatory tramp in great numbers—the rascal who fires the windward side of a broad furze "bush" on a windy night and destroys the game on hundreds of acres of high ground—these are among the many subjects touched by the author and illustrated with a surprising amount of new and minute observation. To write so intimately of preserving and of poaching as "R. J." has done (the author gives us his initials only) it would seem necessary to have been both a gamekeeper and a poacher in one's time. The refined processes of the latter's avocation are dwelt upon to the last detail. The contemporary poacher "has no appetite for thrilling adventure"; his object is simply money; his first care is to avoid suspicion.

"He is often a sober and to all appearance industrious individual, working steadily during the day at some handicraft in the village; a somewhat reserved, solitary workman of superior intelligence. . . . Perhaps the most promising position for a man who makes a science of it is a village at the edge of a range of downs, generally fringed with large woods on the lower slopes. He has then ground to work alternately, according to the character of the weather and the changes of the moon. If the weather be wet, windy, or dark, then the wide, open hills are safe. . . . Upon a bright night the judicious poacher prefers the woods. Meadows with double mounds or thick hedges may be worked almost at any time, as one side of the hedge is sure to cast a shadow, and instant cover is afforded by the bushes and ditches. Such meadows are the happy hunting-grounds of the poacher."

He seldom uses a gun; it is too noisy, and it makes difficulty with the feathers, which must be buried or carried away. "Many poachers' coats are one vast pocket behind the lining." Nets are less used than formerly by "the judicious poacher." His favorite implement is the wire snare. With this he takes rabbits in great numbers, and hares; the latter he can sell for 2*s.* 6*d.* each. He even learns to catch the hare by hand alone, walking slowly by the animal as it crouches in the grass, but not turning the eye upon him, and seizing him "quick as lightning" by the poll. Small birds on the perch he nooses, either by day or night, with a horsehair affixed to a long, slender wand. For larger birds he uses a thin copper wire, acquiring "wonderful dexterity" in this sleight of hand. With the latter kind of snare he fishes; he will speedily land a good basket of pike, jack, or tench. The tench and the trout, like the hare, he takes by the unaided hand, after the method which caused so much surprise in the practice of Thoreau. The poacher first soothes the fish by the untranscendental process of tickling them.

"He slips his bared arm in slowly and without splash, and finds little or no trouble, as a rule, in getting his hand close to the fish without alarming it. He then passes his fingers under the belly and gently rubs it. The fish slowly rises up in the water, and thus enables the hand to get in position for the final seizure. . . . The poacher will often flick a fish out of the water in an instant, so soon as it is near the surface."

This is the only passage in the book that reminds one, by suggestion, of the Walden Pond way of "communion with nature." The style is singularly direct and free from phrase-making; but the writer has a gift for happy touches, as we have seen, and as where, describing the care of a fowling-piece, he recommends a drop of gin as better than any oil for the lubrication of the lock. "The spirit never congeals in cold weather," he says, "and the hammer comes up with a clear, sharp snick."

Histoire des États-Unis d'Amérique. Depuis les temps les plus reculés jusqu' à nos jours. Par Frédéric Nolte. Tomes I., II. (Paris: Didier & Cie.; New York: F. W. Christern. 1878.)—A work of this kind is one among many indications of the growing interest on the part of foreign nations in the United States which has been so noticeable since the close of our civil war. That tremendous struggle, and the forces which it called into action, suddenly aroused the people of Europe to the consciousness that a great nation had come into being on this side of the Atlantic, and was a factor in the affairs of men which could not be overlooked. This new consciousness soon developed the fact that Europeans know very little of America, and many efforts have been made to remedy the prevailing ignorance. The extent of foreign interest in the United States is strikingly shown by the publication of such a history as this, which is wholly popular and is evidently a mere publisher's book, intended to command a large sale as a compendium of useful and amusing information. To Frenchmen, for whom, of course, it is intended, and who are more profoundly ignorant of everything and everybody outside their own country than any other civilized people of equal intelligence, these volumes are likely to prove useful. M. Nolte has brought together in his appendix a number of important treaties, charters, constitutions, and general statistics which are of value and importance. But this is the best part of his work. The history itself is badly ar-

ranged, incomplete, and inaccurate. The author says in his preface that in order to give "local color" he has consulted other works than those published in his own country, and professes himself especially indebted on this score to "Barnes's Centenary History and Ridpath's History of the United States." His full list of authorities is, however, a very short one, and comprises only a few works of the most general nature.

Even these do not appear to have been consulted with much care. M. Nolte's history fairly bristles with mistakes on every page. Some are unimportant errors, others are of the grossest kind. To point them out in detail would require an additional volume. A few, however, are so striking that they deserve notice. La Salle is described as a Jesuit father, who, despite his vows, established a trading-post. As a Frenchman, if not as a historian, M. Nolte ought to have known that La Salle was not a priest, whatever his early connection with the Jesuits might have been. The Quakers and Roger Williams were turned out of Massachusetts at very different times and for very different reasons, yet M. Nolte jumbles them up together as if they were all part and parcel of the same movement. *Edward* Oglethorpe, who it seems assisted his brother James in the colonization of Georgia, has the merit of being a wholly new creation. Gouverneur Morris appears in M. Nolte's volumes as the author of the Constitution, although it has been generally supposed hitherto that that famous instrument was the work of several hands. The name of the Arctic explorer was Kane, not "Kent," and Edmund Randolph did not leave Washington's Cabinet on account of the Jay Treaty, but because he had a connection with Fauchet, the French minister, of which the President disapproved.

These instances are taken at random, and might be indefinitely extended, but there is one statement so original that it deserves literal quotation. In speaking of John Quincy Adams (ii., p. 141) M. Nolte, referring to his return from his first foreign mission, says: "Recalled by Jefferson, who was his friend, he was named by him (Jefferson), in 1806, professor of rhetoric and belles-lettres at Harvard College, in the province of Massachusetts." This implies an amount of centralized power which would have surpassed the most extreme Federalist theories. M. Nolte insists upon maintaining the favorite French custom of alluding to gentlemen who have been knighted as "Sir, Raleigh," "Sir, Howe," "Sir, Prevost," etc. Why Frenchmen cannot give this simplest of titles correctly it is difficult to see, but they seldom do, and their misuse of the prefix has always an air of burlesque.

The book is written with a careful discrimination against anything that is not entertaining. Many chapters are devoted to the Indians and the Indian wars, while half a dozen pages suffice for the entire colonial history of Massachusetts and Virginia. The Revolution is described with fulness, but the administrations of the various Presidents consist merely of sketches of their lives, and of one or two of the leading events which occurred during their term of office. A good deal of space is given to inventions of all sorts, from the cotton-gin to the sewing-machine, and brief accounts of our distinguished authors, with lists of their principal works, are interspersed. M. Nolte certainly fulfils his promise of coming down to the present day, as his history concludes with the death of Bryant, the yellow fever, and the trouble with England about the fisheries.

Birds of the Colorado Valley. A Repository of Scientific and Popular Information concerning North American Ornithology. By Elliott Coues. Part First. Passeres to Laniidæ. (Washington: Government Printing-Office. 1878.)—This volume forms Part I. of a work which promises to be one of the most important of recent contributions to North American ornithology. While it may be regarded as complementary to the same author's 'Birds of the Northwest,' the many excellences of which have won for the author so enviable a reputation as a popular and technical writer on American birds, its scope, as regards the technicalities of the subject, is much more comprehensive, including as it does all the species of birds known to occur on this continent north of the southern boundary of the United States. The work relates, as its title implies, primarily to the birds of the vast and physically highly diversified region drained by the Colorado River and its tributaries, to the life-histories of which the chief part of the text is devoted; the extralimital species being treated in foot-notes, and only so far as regards their synonymy, bibliography, and distribution. These phases of the subject, so important from the standpoint of the specialist, are throughout the work most thoroughly and exhaustively treated, the results presented superseding all previous work of like kind in the same field, and representing an amount of patient and laborious research among the dry bones of science that few who have not undertaken similar work can duly appreciate. The biographies are not only all freshly written, but are based largely on the writer's long and varied experience in the field, and bring down the history of the species treated to the latest discovery respecting their range, nidification, and general habits.

Many of the birds of the Colorado Valley are peculiar to this region, and are consequently among our least-known species, while others range throughout the greater part of the continent, and, having been long well known, there is little that is new to be said about them. It is here that the author's originality of treatment and felicity of expression are most strongly exemplified, as under his ready pen well-worn topics become invested with almost the freshness of novelty. Much information of a general character, and often of a kind not usually found in such association, is introduced under the heads of the several families and genera, as notably in the cases of the warblers, swallows, and shrikes. This includes among other things the etymology and signification of the names, both technical and popular, applied to the various species or groups, and a discussion of the almost tabooed question of the hibernation of swallows, together with copious special bibliographies of this and cognate subjects. We have, in short, in the present work the fullest demonstration of the possibility of making a book on natural history thoroughly scientific, and at the same time popular and entertaining—rigidly exact and exhaustive in all that is merely technical, attractive in all that relates to the popular phases of the subject.

While the portions of the present volume already noticed form so valuable a contribution to the literature of ornithology, the importance of the work is almost immeasurably enhanced by the "Bibliographical Appendix" with which it concludes. This is exclusively devoted to a "List of Faunal Publications relating to North American Ornithology." Although consequently not a complete bibliography of North American ornithology, it embraces nearly or quite fifteen hundred titles, and occupies two hundred and eighteen pages. It consists mainly of the titles of "local lists," but embraces a range of publications from the works of Wilson or Audubon down to the least note on the subject; but all general works which include North America only in conjunction with other countries, all monographs of special groups, and all papers relating to single species are excluded as not strictly pertinent. In explanation of this the author tells us that this piece of bibliography is but a single section of the "Faunal Publications" series of a general "Bibliography of Ornithology," upon which he still is, and has been for a long time, engaged, and that in this general work the papers here excluded fall under other heads. The present division of the work being so far completed as to be available for use is here published in advance, as much time must still elapse before the whole work can be brought out. Ornithologists, and especially those of this country, can but rejoice in the decision that led to the early publication of so invaluable a guide to the great bulk of the literature relating to American birds.

Fine Arts.

EXHIBITION BY THE SOCIETY OF AMERICAN ARTISTS.

THE second annual exhibition of this new-born association was opened on Monday week, and bids fair to attract even more attention than the first. While professedly dedicated to a demonstration of the unconven-

tional, it is seen to be a toilsome effort on most of the painters' part to copy the style of some foreign teacher or other, thus betraying the intensest ideal of conventionality. As for the attention of the ordinary promenader, that is fixed on it by this very confession of foreign impulse more securely than would be possible by any proof of American originality, and also by a little intestine battle of the present year; the members have begun to quarrel with the arrangement made by the hanging committee of their own choice, and three of them, preferring a scandal to dignity, have withdrawn their contributions and explained their grievances elaborately to reporters.

The pupils from France and the pupils from Germany are again drawn face to face in battle array. The Germanic painters, with their showy tricks caught from Piloty and Makart and Lindenschmidt, undoubtedly carry the day with the more impressionable part of the public. In opposition to them the work of the Parisians, based on structural analysis, and rejecting all color that is merely a superficial adornment and is not based on the conditions of the scene, inspire more confidence and beget a better hope for the future. Among the latter, John S. Sargent, whom many look very keenly at as the coming American painter, sends a little picture that does not belie the expectations raised by his radiant group of sea-side *Cancalais* in last year's exhibition. The present envoy is a graceful Capri girl (37), with her Greek pedigree delicately asserted in her posture and her beauty. The figure is set mosaic-wise, without any contrast of values, in an island landscape. The strangest and leanest of olive-trunks, pulling themselves this way and that in an apparent struggle to become grapevines, gad about over the whole panel with a decorative wilfulness and originality that would please a Japanese designer; on one of them, half-accepting its support, half-caught in its toils, the dark-skinned peasant leans. The color is rich, subdued, harmonious, and the drawing securely easy. The picture, which might be signed Hébert without much danger of detection, seems like a frank confession of the mood of creative joy out of which it proceeds. Few youths, indeed, have the chance of imbibing happiness through the cultivation of so many of the senses as Mr. Sargent, whose life has passed in choosing out the most favored countries to grow up in. In music, he is a theorist and a practitioner of more than common profundity. He talks the different languages of Europe, and has kept up his Latin and Greek. He reads everything, and in the studio is treated as a comrade by M. Carolus-Duran, who is indeed something less than the equal of his precocious pupil; in the large ceiling decoration of the "Triumph of Marie de Médicis," which M. Carolus exhibited last year, he introduced among the groups a portrait of his foremost disciple, who had assisted in the work even to the painting in of entire figures; while Mr. Sargent placed on the canvas a likeness of his instructor beside his own. Social and educational advantages, as Sir Frederick Leighton has begun to prove in his own case, do not necessarily lead to dilettantism in art; the old Count D'Orsay kind of dictatorship in elegance is forbidden by the more studious habit of the present age, and there is no reason why a painter who is a gentleman and a student should not succeed in conveying felicities into his work out of the serene air in which he lives. Mr. Sargent's "Capriote" is merely one of his cabinet pictures; but it has in it no touch that contradicts the impression of power and grace which his successive achievements have conveyed.

If one painter may hope to get inspiration out of a courtly Mirandola-like adolescence, another may hope to derive something solid from a youth passed among the exact sciences. Professor Eakins, so far as he is an artist, proceeds from the exact photographic realism of Gérôme, modified by the robust realism of Bonnat, who paints his figures so solid that you seem to see all around them. He, too, plays with languages. He has opinions on the various readings of Dante, and makes pastime of mathematics. When he wishes to draw the ripple of a river for a boating subject, he protracts a set of waves on a paper in theoretical perspective, and lays out on each facet the shape of the reflected object which it would properly send off to the eye. Disguising the formality of this process by a sufficient quantity of variations, he paints from his diagram, secure that nobody will ever deny that his river is flat. His classes are coached through the difficulties of anatomy by an accumulation of illustrations not probably approached in any school in Europe. While a prosector lifts up a given muscle in the dead body upon the dissecting-table, a nude model is made to exhibit the same muscle in prominence by its being shocked from an electric battery. A third exhibition of the muscle is made on one of Auzoux's detachable manikins; a fourth upon Houdon's anatomical figure; a fifth upon the most suitable among the antique statues, of which he has painted some of the slenderer ones—like the Fighting Gladiator and Jason—into a map-work of red muscles and white tendons. Not much confusion can henceforth exist about that detail in the mind of the pupil thus made to see its ideal shape in the antique, its vital energy in the life model, and its reality in the dissection. With all this patience in laying up facts, it is to be seen whether the artist has the artistic faculty to apply them. He sends to the exhibition a kind of challenge to Rembrandt, a modern "Anatomy Lesson." The subject, however, is evidently living, from the chloroformed towel which conceals the head, and from the anguish of the old mother who covers her eyes in a corner; otherwise, it is simply a contemporary Dr. Tulp, explaining the secrets discovered by his scalpel to an audience of respectful pupils. The picture, ordered for Jefferson Medical College by a body of its alumni, and representing Dr. Gross in the familiar working attitude in which he had earned the reverence of his class, is no more amenable to questions of mere taste than Rembrandt's is. Rembrandt's has been removed from considerations of conventionality by the remoteness of its period and the interest of its art, and this may be held to be so removed by the remoteness of its destination in a college and the technical partiality of its future spectators. There can be no great harm in letting it be seen for a space, in an exhibition especially technical, as it passes on its way to the collegiate museum it is destined to remain in. The picture's scale is that of life, and at least twenty figures are included, the subordinate ones well subdued, though all connected with the central action by the most vivid expression of interest. The effect of the aged and quiet professor, in a sharp perpendicular light, as he demonstrates very calmly with a gesture of his reddened fingers, is intensely dramatic. Equally so is that of the horror-stricken mother, in decent and seedy dress of ceremony, overcome by a sudden horror which scatters ceremony to the winds. These two figures, telling by their contrast of professional habitude and unaccustomed terror, are relieved with great constructive skill from the accessory groups, massed together by ingenious combinations or devices of shadow. Few professors have got themselves painted in so interesting a presentment for posterity. A tendency to blackness in the flesh-shades is the principal artistic infelicity in this curious and learned work.

Mr. Duveneck seems to be the strongest of the youths studying at Munich. His "Lady with Fan," showing a cheek from which the blood would spurt at a pin-prick, contains the best morsel of flesh-painting in the exhibition, and one that would be owned by Van der Helst or Reynolds; it is a detail of well-cared-for success, set in a bold, rude sketch also meritorious. This carrying out of a part and leaving the rest in the "powerful" state can only be accepted as evidence of local weakness; the artist would very surely bear on his work to perfection if he was sure he could transmute the vigorous sketch into vigorous completeness. Mr. Duveneck's other pictures are a "Gertrude," a watchful and voluptuous matron sitting like Hamlet's mother at the play, and painted with power inferior only to the last, and a "Smoking Boy," one of those happy-go-lucky dashes at effect which are so deeply unsatisfactory because they show nervous effort instead of effort controlled. Mr. Wm. M. Chase exhibits a series painted with splendid sketching power, and an incorrigible addiction to turning all sorts of themes into "still-life" and bric-à-brac. The "Landscape" (15) is strong and pulpy, and conveys perfectly the unctuous richness of unfathomable black mould; but, though it may seem hypercritical, we must insist that the turf does not look like a growing turf, but like some rich, dead-lustred stuff in a "still-life." The old man who postures in the Venice church, amid an assortment of most gloriously variegated marbles, is not a figure with whose history the painter sympathizes, but is a "bit" and an object of virtù. The portrait of Mr. F. S. Church is simply an athletic effort to "paint down" the obtrusive bosses of a Munich frame, a fearful piece of Bavarian pastry full of lumps and puffs; we have heard even dull spectators constrained to be witty about the forced juxtaposition of dumplings and noodles in this picture. Again, in the likeness of Duveneck, where the subject is treated with all that the artist has of sympathy, and where there is a chair painted with a simplicity and a breadth that make it a picture and would have gratified Velasquez, the subject's blonde face looks round the angle with a slightly lost air, and seems to ask if it too is regarded by the eye of friendship as bric-à-brac. Mr. Currier is represented by two pictures, in which he is shown as deeply inebriated with Franz Hals as ever. The "Scowling Boy," though more interesting than the "Portrait," surely scowls through patches of dirt that are quite involuntary on his author's part, and are meant for "vigor." The "Scowling Boy," as well as Prof. Eakin's "Clinic," was very admirably sketched the other day by the *Graphic* newspaper in the course of some illustrations of the exhibition.

JUST PUBLISHED.

ENGLISH ACTORS,

FROM SHAKESPEARE TO MACREADY. By Henry Barton Baker. 2 vols. (in the Amateur Series, uniform with Lewes' 'On Actors and Acting'), $3 50.

Zoology of the Invertebrates:

The Fourth number in the New Hand-book Series. By Alex. Macalister, Professor in the University of Dublin. Specially revised for American Students by A. S. Packard, Jr., Prof. of Natural History in Brown University. 16mo, 60 cents.

G. P. Putnam's Sons

182 FIFTH AVENUE, NEW YORK,

Have now ready:

Fasting Girls;

Their Physiology and Pathology. By William A. Hammond, M.D. 16mo, cloth extra, 75 cents.

EXTRACT FROM PREFACE.

"In issuing this little book I have been actuated by a desire to do something towards the removal of a lamentable degree of popular ignorance.

"It seems that no proposition that can be made is so absurd or impossible but that many people, ordinarily regarded as intelligent, will be found to accept it and to aid in its propagation. And hence when it is asserted that a young lady has lived for fourteen years without food of any kind, hundreds and thousands of persons throughout the length and breadth of a civilized country at once yield their belief to the monstrous declaration."

Improved Dwellings for the Laboring Classes.

By Alfred T. White. Illustrated. 8vo, 30 cents.

Also the following of the Series of

Economic Monographs.

No. 11. *HONEST MONEY AND LABOR.* An Essay by the Hon. Carl Schurz, Secretary of the Interior. 8vo, 25 cents.

No. 12. *NATIONAL BANKING.* By M. L. Scudder, Jr., President of the "Honest Money League of the Northwest." 8vo, 25 cents.

No. 13. *HINDRANCES TO PROSPERITY;* or, the Causes which retard the adoption in this Country of Financial and Political Measures of Reform. By Simon Sterne, author of 'Suffrage in Cities,' etc. 8vo, 25 cents.

No. 14. *ADULTERATIONS IN FOOD AND* Medicine. By E. R. Squibb, M.D. 8vo, 25 cents.

No. 15. *INTERNATIONAL COPYRIGHT,* Considered in some of its relations to Ethics and Political Economy. By George Haven Putnam. 8vo, 25 cents.

NEW YORK, THURSDAY, MARCH 27, 1879.

The Week.

THE majority in Congress have for good reasons been slow in getting to work upon the business of the session. In the first place, they are divided among themselves as to what the business should be, and whether an early adjournment is desirable or not. Then, as regards the cause of the extra session, the Democratic ascendency in the House is too feeble to make compromise out of the question; and it is clear that the objectionable riders of the two appropriation bills are only kept from being removed and introduced separately on their own merits, by consideration of the delays which the President might lawfully interpose in vetoing them. Sickness and death or other probable accident; the opportunity for bartering votes against the repeal of the Federal election statutes for votes in favor of general measures that would prolong the session; and finally the temptation to defection constantly offered by the little knot of Greenbackers, admonish the House Democrats to use their power with moderation. Mr. Springer has appeared to be most impressed with the uncertainty of their situation, and has carried the caucus with him so far as to agree to conceding to the Republicans Federal supervisors of elections, clothed simply with authority to witness and make note of the transactions at the polls. In the Senate the Democrats not only have a firmer control but feel it, and are elated, too, by what is to them a wholly new sensation. They have reconstituted the standing committees, with the liberal gift of twenty chairmanships to as many of the thirty Southerners among them, and have replaced the secretary, chief clerk, executive clerk, and sergeant-at-arms, all old or hereditary functionaries, with Democrats in good and regular standing. Moreover, they have, under the lead of Mr. Wallace, tabled a resolution of Mr. Edmunds's to limit the session to the objects for which it was called, and have introduced bills of all sorts as if in regular session. But, for that matter, so have the Republicans; Mr. Burnside, for instance, having put in his bill to reorganize the Army.

The debate over the appointment of the new officers in the Senate was very entertaining. The Democrats were intent on making a clean sweep and made it. Mr. Wallace spoke for them briefly, expressing great concern for the proper despatch of the Senate business, but adding that they had persons abundantly qualified to fill the vacant places, and were going to put them in. Mr. Bayard spoke highly of civil-service reform in the abstract, but seemed to think that the Republican officers were not entitled to the benefit of it. The best of the joke, however, came when Senator Conkling arose, and with great warmth protested against putting men in office for party reasons, and advocated the retention of actual incumbents as long as they were faithful and competent. His friends say that this "effort" was a wonderful display of logic, eloquence, and "elocutionary grace," but, strange to say, it produced no effect whatever on the obdurate Democrats; in fact, some of them wickedly smiled.

The main fight was over the Secretaryship of the Senate, which has been filled by a Mr. Burch in place of Mr. Gorham, the Secretary of the Republican Executive Committee. There was no denying Mr. Gorham's activity as a partisan; all that could be said in his defence on that score was that he did not allow this activity to interfere with the proper discharge of the duties of his office. This may be, and doubtless was, true, but it does not cover the case, which illustrates in a striking manner the propriety of Mr. Hayes's famous civil-service order, from which he afterwards weakly retreated. Mr. Gorham has been a very violent "worker." He issued a circular last year calling for contributions from office-holders to the campaign fund, in evasion of the law. He refused to distribute the speeches of Mr. Schurz and that of the President on the all-important question of the currency, on the ground that they did not contain enough abuse of the Democrats to please him. In the circular in which he called for contributions from office-holders he declared that the next Senate would be Democratic, and that foremost among their schemes "the majority announced their intention to attempt the revolutionary expulsion of the President," by means of the Potter Committee. Now, this may have been all true, but it is expecting too much of human nature to expect the Democrats in the Senate to take no notice of it when they come into power. When the Collector of this port, or the Surveyor, or other officer, in like manner takes the stump in a Presidential campaign, and describes the opposition candidate, as Mr. Tilden was described in 1876, as a cheat, railroad-wrecker, and defrauder of the Government, and the opposition candidate is elected, it is useless to expect him to be such a magnanimous reformer as to refrain from dismissing the men who have shown him such outrageous disrespect. More than this, he ought not to retain them, because he cannot expect them to desire the success of his administration or to speak in praise or defence of it. All officers, therefore, who expect to serve the Government, whichever party may be in power, ought to keep out of active participation in the canvass. Mr. Gorham has participated in the canvass in a peculiarly offensive manner, and, much as we desire to see permanence in office—nay, because we desire to see it—we think the Democrats did a good thing in getting rid of him.

The Senate indulged in another debate over a resolution of Mr. Wallace's, calling for a detailed statement of the accounts of the U. S. Marshals employed during the last election in the States of New York, Pennsylvania, Ohio, Massachusetts, and Maryland. Mr. Conkling succeeded in getting this amended so as to include all the States not enumerated, on condition of precedence being given to the first-named. In the House the chief event has been the admission of Representative Hull from Florida, who bore the Governor's certificate, over the Republican contestant, Bisbee, to whom the re-count ordered by the Supreme Court fairly gave the election. The good old Democratic doctrine of standing by the returns would here have had its inconvenience; so the party fell back on the safer principle laid down by the Electoral Commission, and refused to go behind the certificate. The final vote was interesting—140 yeas and 137 nays. Of the fourteen Greenbackers one only voted with the Democrats in this instance, the rest with the Republicans.

A committee of the New York Assembly has been investigating at Kingston the bull-dozing practised at the last town election, for which one would have to seek a parallel at the South. Indeed there is a remarkable resemblance between the Kingston outrages and those in the Louisiana parish of Plaquemine in 1844, which we lately described. The town is a small one, but little exceeding 4,000 in population, and consists in large measure of Irish quarrymen and their families, who have readily become the tools of a ring which has been shamefully plundering the taxpayers. In 1876 the attempt to raise a Republican campaign-banner in an Irish quarter was met with bloodshed and had to be abandoned. This year a union of the taxpayers was effected with a view to shaking off the ring and rescuing the finances of the town; and the better to concentrate the respectable class of voters and guard against fraud at the polls, a law was procured authorizing one instead of five polling-places. This appears to have made matters worse instead of better, for the ruffianly element established the poll in "Mackerelville," took early possession of it, and surrounded it with a dense mob which admitted only Democratic voters, and shockingly maltreated

honest citizens who persisted in trying to reach the ballot-boxes, or who could not restrain their denunciation of the villanous manœuvre. The sheriff of Ulster County was on the scene, but would or could do nothing. Justice O'Conners, a Democratic inspector, opened the ballots at pleasure and occasionally tore them up and rejected them. When he and a brother justice, with the aid of the sheriff, counted the returns, they sometimes found several ballots folded together, which they laid aside "under the candlestick" until it could be seen how the vote would turn out. Of course the ring ticket was successful. What will come of the investigation remains to be seen.

The annual report of the N. Y. State Assessors, submitted to the Senate last month, contains a great mass of facts bearing on the system of taxation in this State, which show that the glaring inequalities and injustices so frequently exposed before continue unchanged. The valuations of each county are determined by the local authorities, some of them (particularly in the large towns) putting them at their market value, or nearly that, others putting them at any figure that may strike their fancy. The result is that "to make a perfectly equal distribution of valuations of real estate, as real estate is now assessed in the several counties, is an utter impossibility." Add to this that personal property, nominally always taxed at its full value, in a large majority of cases escapes altogether, and there is reason enough to complain of the system. Some of the results of it are quite amusing. In Rochester and in Utica, with a population of 100,000, the assessment of personal property to individuals was in 1872 "not equal to the assessment of two widows in Batavia," and the whole assessment was $521,000 *less than the bank capital.* In Utica again, in 1877, while the increase in assessed value of real estate from 1872 to 1877 was over $15,000,000, the personal property had increased only $1,473,550, a state of facts which would go far to show that those investigators of economic phenomena who maintain that "real estate" goes on steadily holding its own amid the general wreck and shrinkage of all other forms of wealth, are right after all. Another peculiar thing, however, about Utica in 1877 was the fact that there were only sixty-seven persons assessed for personal property in the entire town. Some towns show the most surprising and gratifying growth in wealth in times of profound depression—for instance, New Hartford (population 4,307). In 1872 this little town had only $32,800 personal property; in 1876 it could boast $700,000, notwithstanding that Verona, with a larger population, in 1877 had only $12,850. The State Assessors recommend, as everybody who has investigated the subject for the last ten years has agreed in recommending, a total change of system—the abandonment of the personal property tax.

Last Wednesday the case of the Police Commissioners came up before Mayor Cooper. The Commissioners appeared, but with their counsel, and the proceedings were opened by the Mayor's requesting from Mr. Erhardt a reply to the charges contained in his letter of March 14. Mr. Erhardt immediately read a document which among lawyers would be termed a plea to the jurisdiction, setting forth that his term of office has expired, and he is merely holding over, and that he cannot be removed summarily. This defence the Mayor overruled; whereupon Mr. Erhardt put in a second defence, consisting of a demand for charges and specifications of the misconduct in office for which it was proposed to remove him. After this ensued an examination of Mr. Erhardt by the Mayor, which finally ended by the former's refusing to answer any questions; upon which Mr. Cooper took up General Smith's case. An extraordinary scene now ensued; General Smith keeping silence, and his lawyers reading alternately in a loud voice their client's written answer to the charges. They were ordered to stop, and great confusion was caused, but they succeeded in reading the whole of it. The examination of Mr. Nichols resulted in nothing more definite than was obtained in the other two cases. The removal of the Commissioners appears to be decided upon, so far as the Mayor is concerned; but his action is of course, under the charter, subject to the approval of the Governor. The ground taken by the officials is that the right of a "hearing" guaranteed them by the charter amounts to a guarantee of a trial, as in the case of other accused persons. The Corporation Counsel, Mr. Whitney, has recently given the Mayor an opinion on the subject in which he denies the existence of any such right, chiefly on the ground that the Mayor in such a proceeding would have no power to administer oaths, and that there is no mode of procedure provided. This being the case, if attempted, such a trial "can only degenerate into a farce, for a trial without any known mode of procedure being made applicable to it by law is just what anybody may choose to make it."
